PREFACE

This volume, comprising two sections, deals, in the first section, with the basic and special training which was given the various kinds of personnel making up the Medical Department in the United States, and, in the second section, with training in the American Expeditionary Forces.

Obviously, it is impossible to give herein all the details concerning the various schools. In many instances, as in the case of the special schools for medical officers in the United States, schedules of the courses of instruction have had to suffice.

As regards the work carried on at the Army Sanitary School, A. E. F., much of this was preserved in the form of mimeographed memoranda which had been prepared with the view of having them not only for lecture purposes at the school, but also for disseminating them to those members of the Medical Department, A. E. F., who, by reason of exigencies of the service, could not attend the courses at the school. A selection of these memoranda comprises the appendix to this volume. Many of them originally were illustrated. These illustrations have not been reproduced herein; however, great use has been made of them elsewhere, notably, in the volume on sanitation.

In the compilation of this volume, much assistance was rendered by Maj. William B. Borden, M. C., especially in respect of chapters dealing with training in special schools and with training in the American Expeditionary Forces. For this assistance, grateful acknowledgment is now made.

INTRODUCTION

When the United States entered the war there were on duty in the Medical Department 491 Regular medical officers, 342 temporary officers, 86 officers of the Dental Corps, and 62 veterinary officers.¹ The actual strength of the enlisted men of the Medical Department was 6,619,² many of whom were new men, authorized by the national defense act of June 3, 1916. It was considered that 10 medical officers and 100 enlisted men of the Medical Department per 1,000 men of the Army was a necessary allowance in war time,³ and, as these proportions were authorized by the President, it promptly became apparent that the Regular personnel would not make even a complete skeleton for the great numbers of Medical Department personnel which would be necessary for an army of two or three million men. The balance of the body would have to come directly from civil life, and was untrained in military matters, and largely ignorant of its place and functions in a military machine.

While the principles of medicine and surgery and the facts of science are the same for military as for civil life and practice, the whole environment of military life is so different from that of civil life, the methods of procedure necessary for the proper functioning of a great organization are so different from those of the individual and individualistic physicians, the dealing with men in masses and as soldiers is an affair so different from dealing with individual sick civilians, that the well-trained and well-equipped civilian physician or surgeon might stand almost useless and helpless, even in time of great need, unless helped to fit into the military machinery and trained to be a member of the team.

The situation was somewhat similar with respect to enlisted men. They had to be soldiers, and soldiers with special training in technical work—nursing, office work, hospital work, etc. They could not be expected to arrive from civil life with this training; yet the work of the Medical Department was increased with the addition to the Army of each new man. He had to be examined carefully, vaccinated, and cared for when sick, and proper records had to be made in regard to him.

It was planned, therefore, to open training camps and schools for commissioned and enlisted personnel of the Medical Department in the United States; to provide for the continuance, overseas, of the training begun at home; and to make possible the completion of the professional education of medical, dental, and veterinary students in the schools in which they were enrolled when drafted for service in the Army.

The steps in the accomplishment of this plan, as it concerned Medical Department personnel, are given in the chapters which follow. A discussion of the provisions for an enlisted reserve corps representing the professional schools may be found in Volume I of this history (pp. 160 et seq.).

SECTION I
IN THE UNITED STATES
CHAPTER I
PLAN AND DEVELOPMENT

PRE-WAR PERIOD

For many years before the United States entered the World War the training of Medical Department personnel was carried out chiefly by the regular courses of instruction given medical officers at the Army Medical School, in Washington, D. C., and at the Army Service Schools, Fort Leavenworth, Kans.; by the courses given the Hospital Corps in field hospitals, ambulance companies, and detachments; and by the teaching of hygiene and first aid to other branches of the Army.¹ This training which, at first, was confined to the Regular Army, was extended, in time, to the National Guard and to Medical Reserve officers in limited numbers. The field service and correspondence schools for medical officers, Army Service Schools, Fort Leavenworth, Kans., established in 1912, had annually graduated classes of medical officers of the Regular Army and Organized Militia, and had conducted extensive correspondence courses. This school developed the nucleus of men who were later to make possible a broader training on the Mexican border and throughout the Army and the Organized Militia.

ON THE MEXICAN BORDER

During 1916-17 a more elaborate scheme of training, to include officers and enlisted men, was carried out on the Mexican border, under a comprehensive plan prepared by the general sanitary inspector and approved by the commanding general, Southern Department.² Under the provisions of this plan, the training of medical officers and enlisted men of the Medical Department was prescribed, standardized, and enforced.

The value of this border scheme of instruction in carrying out the final Medical Department war training can scarcely be overestimated. Through it, a considerable number of instructors, more or less adequately equipped, were listed, and the best type of training necessary to meet needs became apparent. Hence, when the final need for training suddenly developed, the Medical Department was prepared, in a way, to meet it.

WAR PERIOD

On the day that the United States declared war, the following letter, urging the immediate necessity of instituting measures for the training of Medical Department personnel, was submitted to the Surgeon General:³

1. Simultaneously with the organization of the military forces, the special technical training of the sanitary personnel necessary thereto should be begun. There should be no delay or lost motion. It should be continued without cessation or depreciation so long as the military forces remain in being.

2. On the basis of the raising of the initial war forces of 1,000,000 men, this means a complementary force of 7,000 medical officers immediately required; of whom 500 may be regarded as now well trained, 1,000 as partly trained, 5,500 not trained at all. A further reserve of at least 1,000 officers to meet wastage will be required, and are likewise now untrained.

The same force, for the meeting of its war needs, implies about 100,000 enlisted men of the sanitary service, of whom perhaps 5,000 may be regarded as now trained, 5,000 as partly trained, and 90,000 as not trained at all.

The urgent need for the immediate creation of some effective administrative machinery capable of transforming the above mass into an efficient trained sanitary personnel, without unnecessary delay and difficulty, is obvious.

3. Recent experience on the border has demonstrated that sanitary personnel constantly tends to become sedentary and lose interest, and its work to degenerate into a brief daily internal routine of little training value, except under the stimulus of constant pressure from above. Also that forced training, if recognized as helpful and constructive, greatly promotes contentment among medical officers.

It has likewise demonstrated that line commanders appreciate their own lack of special technical information about sanitary work, leave all initiative in such matters to their medical subordinates, but heartily support plans for sanitary training if these are presented to them.

Whatever of training is done will be due to the initiative, force, and ability of the sanitary service itself. It will strain to the limit every resource of the inadequately manned Medical Department to well acquit itself in the tremendous task now before it.

4. The general scheme for training should be planned, organized, directed, and controlled in the Office of the Surgeon General. If left to local authorities, it will be imperfect and largely ineffective. One officer in the Surgeon General's Office should direct this training. It will take practically his entire time and effort.

The training must be coordinated, comprehensive, and progressive, yet at the same time elastic enough to meet the needs of new increments of untrained medical officers and men. It should cover every phase of the duties of a medical officer and sanitary soldiers.

Local commanders and local sanitary training officers should have no power to disregard or modify such a training scheme in any important essential.

5. The details of the training should be general; requirements, to be specified by the Surgeon General, should be supervised and enforced by a sufficient number of specially designated medical officers attached to troops and selected for their abilities in this respect.

In view of the comparatively recent attention given in our Army to sanitary tactics and field work, only a relatively few officers are probably qualified to act as instructors. An insufficiently qualified instructor will invite criticism and dissatisfaction.

It is earnestly recommended that those who are qualified be given this duty, so that the great mass of untrained personnel may be leavened as quickly as possible, even though the interest of lesser fields of activity suffer slightly thereby.

These training officers should prescribe all details necessary to carrying out the general scheme of the Surgeon General under divers local conditions, see that the training is fully and efficiently carried out through frequent inspections and direct participation in the work, and arrange all local matters necessary to lectures, conferences, war games, drills, marches, tactical exercises, field maneuvers, etc.

6. The sanitary personnel to be trained should not only include those actually with the colors, but also those in civil life obligated to render service at call, or whom it is desirable to train up against future need.

At the outset, those with the colors should first be trained so as to secure as large a number as possible of trained men to help with the work of instruction of later increments.

7. The scheme of instruction naturally divides itself as follows:

(1) To sanitary personnel on duty with the colors: The subjects for this class, so far as officers are concerned, divide themselves into (a) sanitary organization and sanitary tactics,

(b) military hygiene and sanitation, (c) clerical functions, (d) general professional methods as modified by the environment of war, (e) military information relative to the government of medical officers and men as part of the Army.

For enlisted men, the training should cover that now laid down in the Manual for the Medical Department, Drill Regulations for Sanitary Troops, and Mason's Handbook.

The theoretical training connected with the above should include prescribed courses of reading, recitations, conferences, demonstrations, and map maneuvers.

But the training should as far as possible be practical, making use of all the usual facilities of hospitals, camps, marches, and maneuvers for the purpose. In addition, periodic sanitary maneuvers on a large scale should be carried out.

The personnel for instructors of this class is mentioned elsewhere.

(2) To officers of the medical section, Officers' Reserve Corps, not yet called to the colors: The same subjects as are mentioned under (1), except in a more elementary way. From the nature of things, this instruction must largely be theoretical and didactic. It is preliminary to the more comprehensive training contemplated when called to service with troops.

No training of potential soldier recruits still in civil life, in advance of their enlistment, seems practicable, unless the Red Cross will charge itself with such work.

Instruction to this class of reserve officers may be given in connection with that for officers in active service in their vicinity, by medical officers on special duty, by conferences among the student officers themselves, and by correspondence.

(3) To students in medical colleges, as prospective medical officers: The subjects for this group include: (a) First-aid and emergency surgery from the military standpoint; (b) schools of the sanitary soldier, litter drill, and transportation of wounded; (c) elements of sanitary organization and sanitary tactics; (d) elements of military hygiene and sanitation.

The instruction here should be given in the present emergency by their present civilian instructors, who should be appointed in the Officers' Reserve Corps and would themselves learn much through the necessity of having to teach others.

(4) General information: This includes dissemination of diverse items of current medico-military value through—

(a) Orders, circulars, bulletins, books, etc.

(b) *The Military Surgeon*.

This is a very valuable aid to supplement the standardized instruction and should be utilized to the utmost.

8. With each field army there should be, under the chief surgeon thereof, a medical officer as training officer, with the rank of colonel. It is his duty to see that the training of all officers and men throughout the field army is suitable, sufficient, and coordinated. His work is one of direction and inspection.

9. With each division there should be, under the division surgeon, a medical officer as training officer, with the rank of lieutenant colonel. He directs, teaches, and inspects.

He should have direct military control, under the division surgeon, of the sanitary personnel of the division. For this purpose, the sanitary personnel of the division should be organized as a regiment of three battalions—one battalion of which may be assumed as on detached duty with the component combatant organizations of the division and under the orders of the commanders thereof. The other battalions in actual being to consist of divisional troops, one battalion to be the ambulance battalion and the third the field hospital battalion.

But whether this proposed organization is accepted or not, a training officer is absolutely necessary for the education of all the sanitary personnel with the division. It will take the entire energies of one officer on this work alone to bring about even reasonably satisfactory results.

Officers who have had suitable experience with ambulance companies and field hospitals should be designated as directors of ambulance companies and field hospitals, thereby greatly facilitating the training of these units. Unfortunately the entire available supply of these trained men will not equal the demand.

Instruction in the clerical work with the division will have to be done by a special officer, not necessarily of higher rank than captain; such an officer should be attached to the division surgeon's office and work directly under the training officer. His work is to remove at their source all the present great difficulties connected with the paper work of untrained officers, and thereby save a vast amount of inaccuracy and resulting correspondence.

10. For independent forces smaller than a division, a training officer with the rank of major is necessary.

11. If troops are not organized into the large tactical organizations, the same plan as above, applied to departments, districts and camps, will serve.

12. The inclosed "Memorandum of instruction for medical officers and sanitary units,"^b prepared by the undersigned and issued in the Southern Department for troops along the Mexican border, should serve, with but little change, for the training of sanitary personnel in the mobilization camps contemplated.

13. The foregoing scheme does not include the training of medical officers and sanitary soldiers at special medical camps or training schools, as has been found desirable in the British service for the personnel not actually required with troops to serve their immediate needs.

Such separate training is most desirable; but its details have not been entered into pending any plan by the General Staff for the training of the officer class as a whole, with which the sanitary training should as far as possible be coordinated.

14. If desired, the undersigned is prepared to work up a complete scheme for training, in detail.

PLAN FOR TRAINING

The above letter and its purpose were approved by the Surgeon General, and its author was directed to prepare the necessary plan and to put it into practical execution after conference with the Bureau of Militia Affairs, which had just prepared a short course of armory training for the Medical Department of the Organized Militia. This was done after conference with the representative of the Medical Department in the Bureau of Militia Affairs, and a joint report was sent in by them on April 16, 1917.³

This joint report was forwarded on April 21, 1917, by the Surgeon General to The Adjutant General, with the following remarks:³

* * * * *

As soon after enrollment as their services can be spared from recruiting or other preliminary duty, all officers of the medical section of the Officers' Reserve Corps will report in turn, as their services can be spared, at such camps as may be designated for a three months' course of instruction, the scope of which will be fixed by the Surgeon General.

2. The attached scheme affords a plan for starting, without delay, the necessary training of the officers and men of the Medical Department. It can be modified later as experience may warrant. It proposes to carry out an intensive training of both officers and enlisted men, both in special training camps and in addition to necessary service with troops. For the former class, the course covers three months; for the latter, six months.

3. The nature and scope of the proposed course, sample daily routine, list of textbooks, etc., are given therein.

4. For the above instruction purposes it is believed that four medical training camps should be established. The Medical Department, among other cogent reasons, can not furnish instructors or equipment for more than this number. They should be established in conjunction with the general officers' training camps at Fort Oglethorpe, Fort Riley, Leon Springs, and Fort Benjamin Harrison, and later, if found desirable, one on the Pacific coast; but if a suitable camp and maneuver ground can be found on the Atlantic seaboard south of New York, this should be substituted for Fort Benjamin Harrison.

5. If approved, I recommend that the necessary facilities for shelter, messing, supply, etc., be provided without delay for the use of these training camps at the above points.

^b This memorandum is on file in the Office of the Surgeon General (Old Files, 7,832).—Ed.

6. Authority is also requested for the bringing to these training camps of a training staff of approximately one officer instructor to each 50 student officers, together with such enlisted personnel as may be necessary.

7. I also request that 1 ambulance company and 1 field hospital be sent to each of these training camps, and that 3 additional ambulance companies and 3 additional field hospitals be organized at each without delay. Also that each training camp be further provided with an enlisted force equivalent to six regimental sanitary detachments. The above personnel is necessary to visualize medical organizations, equipment, and field work, and serve as a service corps in looking after the training camp and the many hundreds of student officers to be in attendance.

8. Authority is further requested for the establishment of a training course for the sanitary personnel with troops, the appointment of officers as training officers, with divisions or separate camps, and the establishment of a system of inspection sufficient to insure the efficiency of the same.

9. It is requested that this matter be given decision as soon as possible. It is understood that the general training camps are to begin operation on May 15. The Medical Department should begin its work at least by that time, and, if possible, one or more of its camps should be put into operation before that time.

10. Attention is invited to the fact that the work of the Medical Department actively begins the moment troops are raised or brought together, and that the equipment of these training camps, the detailed organization of the training course, and the provisions of the staff of instructors should therefore be made as soon as possible.

11. Attention is invited to the attached plan, which is concurred in.

W. C. GORGAS,
Surgeon General, United States Army.

The plan was approved and acted on by the War Department, as follows:

[First indorsement]

2581692

WAR DEPARTMENT, ADJUTANT GENERAL'S OFFICE,
May 11, 1917.

To the SURGEON GENERAL.

With the information that the establishment of additional subdivisions of the work in the Office of the Surgeon General, as referred to herein, is approved with the following exceptions:

That no increase of the Medical Corps in number or grades shall accrue therefrom: That the chief of the sanitary section may consult with, and make recommendation to, the Quartermaster General in regard to construction of a sanitary character, and may also recommend sanitary orders, but all orders will be issued in the way now prescribed by regulations; and

That four medical training camps, to begin June 1, 1917, with an attendance of officers for training at each to be not over 600, are approved; and that the tentative scheme of instruction is approved and will be submitted in form to be published as a general order.^c

In this connection attention is invited to copy of letter sent to commanding generals, Central, Southern, and Southeastern Departments, relative to the establishment of the medical training camps referred to above.

By order of the Secretary of War:

WM. M. CRUIKSHANK, *Adjutant General.*

^c Special Regulations No. 49a, W. D., May 15, 1917.

[First indorsement]

2581692

WAR DEPARTMENT, ADJUTANT GENERAL'S OFFICE,
May 11, 1917.

To the QUARTERMASTER GENERAL:

For his information, and with request to provide cantonments at each of the medical training camps mentioned herein, as follows:

Infantry cantonment for 600 men.

Cantonment for 4 ambulance companies and 4 field hospital companies of the Regular Army.

The cantonments to be ready for occupancy before June 1, 1917.

By order of the Secretary of War:

WM. M. CRUIKSHANK, *Adjutant General.*

(Copy of first indorsement on 2581692 to Surgeon General accompanying.)

MAY 11, 1917.

From: The Adjutant General of the Army.

To: The Commanding General, Central Department, Chicago, Ill.

Subject: Medical training camps, 1917.

1. The Secretary of War directs that you establish medical training camps in connection with officers' training camps already authorized, to begin June 1, 1917, at the following posts in your department:

Fort Riley, Kans.

Fort Benjamin Harrison, Ind.

2. The purpose of these medical training camps will be for the training of reserve medical officers; the attendance at each camp not to exceed 600; the course of instruction to begin June 1, 1917. The Quartermaster Corps will provide an Infantry battalion cantonment for 600 men and cantonment for 4 ambulance companies and 4 field hospital companies of the Regular Army, these cantonments to be ready for occupancy before June 1, 1917.

WILLIAM M. CRUIKSHANK, *Adjutant General.*

The same letter was sent to the commanding general Southern Department, Fort Sam Houston, Tex., substituting Leon Springs for Fort Riley and Fort Benjamin Harrison, and to the commanding general Southeastern Department, Charleston, S. C.

The proposed medical officers' training camp at Leon Springs, Tex., was never established, through inability to provide the necessary staff of instructors therefor.³ However, authority was later received to raise the quota of student medical officers from 600 to 1,000 at each of the other three camps, with the net result of an increase of 600 medical officers in all.

To each of these camps a training staff of selected regular medical officers, each one recognized as an expert in his line, was assigned.³ These staffs varied from 10 to 12 officers.

The camps had to be organized and buildings erected at a time when large numbers of officers and men were arriving, frequently without advance notice and often without equipment.³ It was a period when the facilities of the Quartermaster's Department were strained to the limit by new construction, but some tentage was secured and put up, and buildings subsequently were erected rapidly enough to meet actual needs.

There was much shortage and delay in respect to clothing, equipment, and other supplies, due to inability of the supply department to meet the needs of a rapidly expanding army.³ Fortunately, no hardships resulted, and participation in the actual organization was in itself a valuable phase of training.

The work of instruction was at once started. As the first need for medical personnel was obviously to be with the regiments and divisions shortly to be organized, a course was worked out to meet such need for the zone of operations and this remained as the basic course of the training work throughout the period of the war.³ Later, courses for line of communications work, for special training in various medical branches, and courses for the several nonmedical branches of the Medical Department were organized.³

The plan of instruction, including the basic course of training, to be carried out at these medical training camps was covered in the following letter of instructions:^{4 d}

1. These instructions are intended to coordinate the work at the various medical camps of instruction so that it will be carried out on common lines.

Also so that the instruction given at these camps, and that which it is proposed to give the medical personnel necessarily serving with troops to meet their needs in the field and at posts, shall have similar basis and method.

To the end that the instruction to be given, and the results to be secured, shall be standardized, the general provisions of this letter will be strictly carried out. All details of execution are left to you, and you are held responsible for proper results.

2. The course at the medical officers' training camp is intended to give the student officers a general idea of the basic duties of a medical officer and prepare them for service with troops in the field.

Training will be intensive and pushed as rapidly as possible. It will be borne in mind that the service of thousands of instructed medical officers must be available at an early date.

3. The training to be given is intended to prepare these officers to conduct the service of the Medical Department without either the supervision of experienced medical officers or the aid of well-qualified noncommissioned officers. The limited number of these two classes in the Medical Department, and the necessity of assigning many of them to important administrative duties, render it probable that few will be available for regimental duty, and only a small number with ambulance companies and field hospitals.

For this reason, also, upon the reserve medical officers graduated from these training camps will fall the duty of themselves drilling and training the very many thousands of enlisted raw recruits which will be assigned to the Medical Department, and they must be put into a condition to carry out effectively this most important work.

4. Each camp will have accommodations for 600 medical officers. They will be organized into companies, duly officered and noncommissioned officered from among themselves, and trained on a basis of medical cadets. It is desired to impress upon these new officers, by actual experience, what will later be required by them of their subordinates.

5. Your staff will be composed of an assistant commandant, an adjutant, and a quartermaster, all of whom will be instructors in addition to their other duties. It is proposed, if possible, to assign you additional instructors on the basis of 1 to each 50 student officers. Due to the shortage of regular officers, specially qualified militia medical officers may be assigned to such duty. Officers with regimental detachments, ambulance companies, and field hospitals will, in addition to their duties as such, serve as instructors.

You will make such assignment to instruction duty as you deem best, making due effort to assign to each subject officers known to you to have given special attention thereto and to possess ability to impart information.

You are authorized to use as instructors any student officers found specially qualified in any subject, and to give them special authority while so serving, irrespective of rank.

Your staff of instructors will, if desired, give the necessary instruction in hygiene and first aid to the line officers of the adjacent training camp. Conversely, you should ask the assistance of the line officer instructors at line camps in teaching map reading, in special lectures, and in the tactical part of medico-military problems and maneuvers.

⁴ This basic course was found satisfactory, practically without change, after a year's trial.

6. Instruction by lectures, except in special subjects, will, as far as possible, give place to recitations. Lectures are not considered as effective as recitations in imparting detailed information, nor do they afford opportunity to test the capacity and grade the student.

Lessons will, therefore, be assigned in the authorized textbooks, and quizzes held thereon, for the purpose of grounding them in theory and insuring that a competent knowledge of methods and principles has been acquired.

7. But coincident with this theoretical instruction, the student officers should as far as possible be made to visualize the organizations, apparatus, and methods concerned. In addition to study and lectures, it is most important that they should learn by seeing and doing. So far as possible, instruction will be made practical.

To this end, for example, all sanitary appliances and methods likely to be of use in field work will be procured or constructed and continually kept in effective operation at the camp, and the officers will be shown their purpose and practical use.

Bombproofs for trench warfare and gas chambers for practical trial of protection against poison gases will be constructed.

In connection with paper work, all papers required by the medical and other departments will be actually made out until familiarity therewith, and correctness of result, is secured.

Mess management, taught in theory, will be actually demonstrated in the organization kitchens. Applied camp sanitation will be taught by sanitary inspectors. Drill will be taught until every officer can himself effectively handle and instruct therein the units and detachments of the Medical Department.

The internal economy and administration of regimental detachments, ambulance companies, and field hospitals will be taught not only by books but by assignment to such organizations and quartering and subsistence therewith, and by actually handling them in marches and comprehensive field problems. To permit of the latter it is expected that 4 ambulance companies, 4 field hospitals, and 6 regimental sanitary detachments, all complete and kept recruited up to war strength, will be organized at your camp without delay. The regimental detachments will be organized as two provisional companies, to be split into their integral parts for demonstration purposes.

8. You will assign student officers to duty with regimental detachments, ambulance companies, and field hospitals as junior officers and supernumeraries, to familiarize them with these organizations, the handling of men, etc. Officers so assigned should be quartered and messed with these organizations, but will pursue the regular curriculum of training at the camp. Assignment should be made in rotation, and ordinarily for 10 days with each organization.

9. The training course will be divided into three periods of one month each. The first, while instructing the officer as such, is intended especially to familiarize him with the duties of his enlisted subordinates whom he must shortly train. The second takes up his training in his own special functions as an officer. The third carries on and completes the work of the second period.

New training classes should as far as possible be started at the conclusion of each month's training period. However, to meet immediate needs, officers needing training will be sent to camps at any time and will be organized at once into groups for instruction.

10. The following textbooks are authorized for the course of instruction: Army Regulations; Manual for the Medical Department; Field Service Regulations; Drill Regulations for Sanitary Troops; Manual for Courts-Martial. Such other school textbooks as may be authorized will be announced later.

These books will be invoiced to you without requisition. You will issue one copy of each to each student officer, who will take them with him when he leaves camp for duty elsewhere, for reference and use in training his subordinates.

Maps and war-game sets will be sent out on requisition.

You will procure maps of the maneuver grounds in the vicinity of your camp from the commanding general of your department. One map should be available to each student officer.

11. The daily instruction, except Saturday afternoon and Sunday, should approximate 7½ hours daily.

It is left to the commandant of each medical officers' training camp to prepare schedules for the hours available in each period of instruction among the subjects and time therefor required. This will enable the meeting of the needs of emergency, stormy weather, etc. Copies of the detailed schedules so prepared by you will be furnished this office as soon as practicable.

12. The following general scheme is suggested for the daily schedules for the first month:

A. m.	
6. 00-----	Reveille.
6. 15- 6. 30-----	Setting-up exercises.
6. 35- 7. 25-----	Breakfast; police of quarters.
7. 30- 8. 25-----	Drill (marching).
8. 30- 9. 25-----	Drill (special).
9. 30-10. 25-----	Quiz or lecture.
10. 30-11. 25-----	Quiz or lecture.
11. 30-12. 55-----	Dinner; rest, etc.
P. m.	
1. 00- 1. 55-----	Quiz or lecture.
2. 00- 2. 55-----	Quiz or lecture.
3. 00- 4. 25-----	Equitation.
4. 30- 5. 55-----	Care of animals, supper, rest, etc.
6. 00-----	Retreat.

13. On this general plan, 180 hours of formal instruction will be given monthly. No evening exercises are contemplated. Time will be needed for study. Saturday afternoon should be a rest period. Officers should be encouraged in equitation on Sunday, preferably in form of tactical ride. The schedule for the third month will vary materially from above, due to the practical field sanitary problems contemplated, and the fact that at least one full half day is ordinarily needed for each. This provides for a total course of 580 hours of instruction.

14. The following scheme shows the proposed scope and distribution of training of medical officers during the first period of 1 month of 30 days:

	Hours
Setting up (15 minutes daily for 26 days)-----	6.5
Drills (marching, litter, ambulance, other means of transport)-----	52
Inspections-----	4
Equitation, bridling, saddling, care of animals, etc.-----	33
Tent pitching, shelter tent-----	2
Tent pitching, pyramidal tent-----	2
Personal equipment of the sanitary soldier-----	1
Field and surplus kits-----	1
Care and maintenance of soldier's equipment-----	2
First-aid, using soldier's equipment only-----	2
Examination of recruits, with papers and finger prints-----	8
Nature and employment of regimental medical supplies-----	8
Customs of the service-----	2
Duties of the soldier-----	4
Relation of Medical Department to rest of Army-----	1
General organization of Medical Department for war-----	4
Army Regulations-----	12
General organization of military forces-----	2
Manual for the Medical Department-----	12
Military hygiene and sanitation-----	6
Field Service Regulations-----	6
Paper work, relating to the Medical Department-----	4
Map reading, use of compass, orientation, etc-----	6

The following scheme shows the scope and distribution of training of medical officers during the second period of 1 month of 30 days:

	Hours
Setting up (15 minutes daily for 26 days).....	6.5
Drills, marching.....	26
Inspections.....	4
Equitation, and care of animals.....	33
Tent pitching, hospital tentage.....	4
Elementary road and position sketching.....	4
The regimental detachment, its use and internal administration.....	8
The ambulance company; its equipment, use and internal administration.....	8
The field hospital; its equipment, use and internal administration.....	8
The tactical use of Infantry (lecture by line officer).....	1
The tactical use of Cavalry (lecture by line officer).....	1
The tactical use of Field Artillery (lecture by line officer).....	1
The use of the Engineer and Signal Corps (lecture by line officer).....	1
The service and mechanism of supply in the field (lecture by quartermaster).....	1
Paper work, relating to the Medical Department.....	12
Paper work, relating to the Quartermaster's Department.....	4
Paper work, relating to the Ordnance Department.....	2
The Medical Department in campaign.....	8
The principles of sanitary tactics.....	8
Map problems.....	4
War games.....	8
Military hygiene and sanitation.....	12
Army Regulations.....	6
Manual for the Medical Department.....	6
Lectures on special subjects.....	4

180

The following scheme shows the scope and distribution of training of medical officers during the third period of 1 month of 30 days:

	Hours
Setting up (15 minutes daily for 26 days).....	6.5
Drills (service as drill master in drills of diverse nature).....	26
Inspections.....	4
Equitation.....	15
Handling of rations and mess management.....	2
Manual for Courts-Martial and military law.....	8
The Articles of War.....	1
The Geneva and Hague conventions.....	1
The rules of land warfare.....	1
Military surgery.....	8
Poison gases, protection against, symptoms and treatment (demonstrations); liquid fire.....	2
War psychoses and neuroses; shell shock; malingering.....	3
Trench warfare; "trench foot".....	1
Demonstration of trench system, including bombproofs, dugouts, entanglements, abatis, etc.....	1
Cantonment hospitals, organization and management of.....	2
The sanitary service, line of communications.....	1
Hospital ships, ships for patients, hospital trains, trains for patients.....	2
Base hospitals, their organization and management.....	1
General hospitals, their organization and management.....	1
Contagious disease hospitals; casual camps, convalescent camps, camps for prisoners of war.....	1
Organization, functions, and limitations of the American Red Cross.....	1
The civil sanitary function of the Army Medical Department in occupied territory...	1

	Hours
War games.....	2
Tactical rides.....	6
Sanitary inspections, practical demonstration of methods.....	4
Practice march and bivouac (2 days).....	13
Practical field maneuvers, including brigade and divisional problems, with two night problems, and utilizing regimental detachments, ambulance companies, field hospitals, stations for slightly wounded, etc., in coordination. Problems will include the attack, retreat, planned defense and rencontre.....	60
Lectures on special subjects.....	4

180

NOTE.—For the proper conduct of the large medical maneuvers contemplated during this period the services of a company or battalion of the Signal Corps are desirable. The duties assigned to them, however, are such as pertain to their normal functions and training. When line troops are available the above problems should be carried out with them as part of their training as well as that of the sanitary personnel.

15. Dental surgeons and veterinary surgeons will be required to take the general course for medical officers, with the exception of the subjects which pertain more or less exclusively to the work of medical officers as such, with the substitution therefor of subjects directly relating to the dental or veterinary service. Pending instructions from this office, you will arrange tentatively for this special instruction.

16. To stimulate student officers to their best work a certain number of places in the grades of captain and major, Medical Department, Officers' Reserve Corps, will be left unfilled. Appointment will be made to these vacancies from among the student medical officers, who, on vote of your staff of instructors, are recommended by you as possessing such exceptional knowledge, aptitude, and efficiency as would qualify them for such increased rank.

To this end you will establish and maintain a graded system of marking, by which relative efficiency will be recorded.

17. Also medical officers satisfying the age and other requirements and after passing such examinations as the Surgeon General may require may, on your recommendation, and subject to the vote of your staff of instructors, be commissioned at once as first lieutenants in the Medical Corps of the Army.

18. If any reserve officer is found unfit for the service by reason of physical, mental, moral, or temperamental reasons, you will, on vote of your staff of instructors, recommend him to this office for separation from the service.

19. Attention is invited to the great administrative as well as training problems presented by your camp. The large number of medical officers under training must be sheltered, fed, supplied, and administered, their camp policed, wastes disposed of, mounts cared for, etc.

The personnel of the regimental detachments, ambulance companies, and field hospitals will, in addition to their other duties, be used by you as a service corps to carry out the above duties.

20. You will, without delay secure definite accommodations and facilities for your medical training camp, in respect to any other training camps near by, so that there may be no later interruptions, modifications, or curtailment of the work of the Medical Department camps.

21. You will request by wire the number of noncommissioned officers and clerks which you will require for your headquarters and the number of cooks necessary for the officers' messes.

22. For the purpose of practice in equitation you will make requisition at once for the necessary number of mounts, and saddle equipment therefor, on the basis of one mount for each four student officers.

Mounts pertaining to the ambulance companies, field hospitals, and regimental detachments will likewise be used by the student officers in equitation when not actually needed in the work of these organizations.

23. The sick from your camp will receive infirmary treatment from a camp infirmary to be maintained by you. Hospital treatment will be given at the hospitals provided for the needs of the local coordinated training camps as a whole.

You will arrange to have the use of this hospital for the instruction of medical officers in the administration of such hospitals and the training of enlisted men as nurses and as surgical and dispensary assistants.

24. In conjunction with the training camps for medical officers it is proposed soon to establish training camps for enlisted men of the Medical Department. As soon as possible you will prepare a tentative plan for the training of these men in conjunction with the medical officers' training camp and forward it to this office for consideration.

Courses should be based on a three months' period, having in mind that the needs of the service may require the detachment of some of these men after six weeks' or two months' training.

25. You will also prepare and submit to this office plans for advanced courses of training for enlisted men, to cover not more than one month, to be specially instructed as (a) nurses, (b) surgical assistants, (c) dispensing assistants, (d) dental surgeon's assistants, (e) clerks.

26. You will also prepare and submit a plan for the instruction of selected privates who have finished the basic course proposed in paragraph 14, with a view to their promotion as noncommissioned officers. This course should not exceed six weeks. It is proposed to appoint men who, after satisfactorily finishing the basic course for enlisted men and the additional course for candidates as sergeants, are reported by you as qualified for such promotion.

27. Instruction as cooks, horseshoers, farriers, saddlers, mechanics, and chauffeurs of enlisted men who have finished the basic course of training will, it is contemplated, be given in the general schools in such subjects which are or may be established for the Army as a whole.

The Medical Officers' Training Camps at Camp Greenleaf, Fort Oglethorpe, Ga., Fort Riley, Kans., and Fort Benjamin Harrison, Ind., were opened on June 1, 1917, although an effort was made to have orders for student officers amended so as to have them report on June 15 (see history of individual camps, *infra*). This effort for delay failed through clerical error in the War Department, and considerable numbers of student medical officers arrived at these camps on June 1, and immediately thereafter. This, though regretted at the time, proved to be fortunate, as it gave an extra fortnight of much-needed training to many.

What this training meant may be inferred from the fact that on August 27, 1917, one week before drafted men were to arrive at National Army divisional encampments, there left from each of the three medical training camps five trains of medical officers and enlisted men of the Medical Department.³ Each train went to its separate camp and contained a quota of about 60 medical officers and 310 enlisted men, who were not only suitably organized for the formations with which they were to serve, but in each detachment officers and men were specially selected for fitness in the duties which they were intended to perform.

These 900 medical officers and 4,600 enlisted men went to the 15 divisions that were ready for them, and were able to provide for themselves, attend to sanitary matters, and arrange for the handling of recruits in great numbers in advance of the arrival of the latter.³ By this means the Medical Department met the strain imposed upon it at the start, and, by drawing from the trained reserve in the training camps, was equal to all subsequent emergencies.

At this time a considerable number of physicians from civil life were entering the Army and were being sent direct to service with troops at posts and camps, without having the benefits of training given at a medical officers' training camp. It was realized that, unless attention was drawn to their shortcomings, and a way prescribed for remedying them, outside of the daily routine, little, if anything, would be done in preparation for future, and probably quite dissimilar, duties. Accordingly, a letter of instruction was sent to all department and Regular Army division surgeons, similar to that given above, outlining the instruction at medical training camps.³ It was realized, however, that many of the facilities at the medical training camps would not be available at posts, garrisons, and small camps, and the course of instruction at such places, therefore, was appropriately modified. A full course of reading was everywhere prescribed, with such practical field work as local facilities afforded. Commanders were charged with enforcement of the requirements of the course, the Inspector General's Department being asked to specially check up this matter. On the whole, this garrison training was very helpful, and a vast amount of work was done by untrained medical officers who, in the absence of such guidance, would have recognized neither its need nor the nature and manner of attempting it.

The next step in the plan of instruction was that for the training of medical personnel with the new divisions. On October 3, 1917, a letter of instruction was sent to all division surgeons, prescribing a course of training effective November 1, to be carried out as rapidly as local conditions permitted and to be concluded only when the Medical Department personnel had demonstrated reasonable qualifications therein before a board of medical officers. (See Chap. IV, *infra*.) The total ground to be covered approximated that included in the medical officers' training camp course, and a "training officer" for each division was ordered designated. As each division contained officers and men who had practically completed the course at training camps, others who had only partially completed it, and still others who had not been trained at all, it will be realized that it was no easy task to give each individual the exact training necessary to remedy his deficiencies.

After covering the prescribed course, and thereby securing the fundamental training of the great majority of medical personnel, no further medical training was officially required in divisions, it being believed that it could be left to division surgeons to require the proper training of such new medical officers and enlisted men as might require training after joining.³ It was believed, also, that the prescribed course of training would furnish any necessary number of instructors for any later course of instruction. In general, these assumptions proved correct.

In the late fall of 1917, it became apparent that a certain proportion of medical officers who had gone direct from civil life into hospitals were not being qualified for their duties as rapidly as desired. The division of hospitals of the Surgeon General's Office was requested to take steps to rectify this condition, which it did by the issuance of a letter dated November 1, and a memorandum in detail dated November 15. In each of these a course of study, training, exercises, clinics, etc., was prescribed. This work is given in detail in Chapter V, *infra*.

After the immediate need for medical personnel for service with troops in the zone of operations had been satisfied, it became apparent that a somewhat different scheme of training from that embodied in the basic course for medical officers' training camp would be necessary for personnel intended for service in line of communications formations, including members of Red Cross and other units, elderly or less robust men, and professional experts whose special talents were too valuable to be wasted by service with front-line troops.³ About this time, a cablegram from overseas urged the sending for duty overseas as rapidly as possible "of these urgently needed troops." A two months' course was organized, therefore, for line of communications men, being essentially an abridged basic course, from which much of the front-line training in sanitary tactics, map work, equitation, etc., had been cut out, and certain additions made in matters of professional training, especially in respect to military medicine and surgery.⁴

Applying the foregoing line of communications course, it early became apparent that the number of medical and surgical specialists entering the Army was not equal to the demand, and that special technical training of a certain number of medical officers would be necessary.³ In this professional training, the great training camps afforded the widest kind of selection of the medical officers apparently best qualified to profit by training in a professional specialty. If, on trial, an officer was not found to measure up to expectations, no further time was spent on him but he was returned to the student body, subject to general duty or other assignment. The better grounded and more adaptable men were thus selected, time was saved from instruction, and the tendency of some officers to pose as experts in a subject in which they merely desired to be trained was thus offset. (See Chap. VI, *infra*.)

In addition to the special schools for the training of medical officers in the professional specialties, beginning in the early fall of 1917, special schools were established in the medical centers of the United States in which courses of instruction were given in general war surgery and fractures, including the Carrel-Dakin method of treating war wounds; oral and plastic surgery; neurosurgery; Roentgenology; neuropsychiatry; urology; laboratory methods; cardiovascular lesions.³ Each of these special schools was established largely through the efforts of the medical officers in charge of the division under which the specialty came in the Surgeon General's Office, in cooperation with the medical committee of the Council of National Defense.³ (See Chap. VII, *infra*.)

Prior to our entry into the war the medical journals of the country frequently published the observations and studies of independent observers of American and foreign nationality, of both the medical service of the armies of the nations with whom we were finally allied and those of our enemies.

As training developed, the obvious need for epitomized texts on medicomilitary subjects caused the Surgeon General to have compiled and published a series of manuals, edited by competent officers, which were distributed among the various schools. The subjects covered follow:

Medical War Manual No. 1. Sanitation for Medical Officers.

Medical War Manual No. 2. Notes for Medical Officers.

Medical War Manual No. 3. Military Ophthalmic Surgery.
Medical War Manual No. 4. Military Orthopedic Surgery.
Medical War Manual No. 5. Lessons from the Enemy.
Medical War Manual No. 6. Laboratory Methods, United States Army.
Medical War Manual No. 7. Military Surgery of the Zone of the Advance.
Medical War Manual No. 8. Military Surgery of the Ear, Nose, and Throat
Manual of Surgical Anatomy, United States Army and Navy.
X-ray Manual, United States Army.
Manual of Neuro-Surgery.

Concurrently with the publication of texts in this country the chief surgeon, A. E. F., developed and published Splints and Appliances, A. E. F., and a Manual of Urology, which were used, in conjunction with other texts, in the schools in the United States.

With the encouragement and support of the chief surgeon, A. E. F., the American Red Cross undertook and successfully published a journal of progressive medicine and surgery under the title, *War Medicine*, which was distributed to all medical officers of the forces abroad. This publication fulfilled an important function in conveying information to medical personnel.

These publications were used as guides for medical officers and made possible a text for instruction as well as a book of ready reference for the officer busy with intensive courses of instruction and work in the United States and in Europe.

Considerable help was obtained through lectures and demonstrations given from time to time to medical officers in the service schools and medical officers' training camps by experienced allied officers.⁵

A number of our specialists were ordered overseas early in 1918 to make tours of inspection of the allied and American hospitals, to observe the methods employed by the allied hospitals in organization and in treatment of special medical and surgical conditions, and to discuss with and obtain from allied specialists their views as to the best methods of organization and utilizing the specialties. These officers were returned to the United States and rendered reports to the Surgeon General covering these problems.⁶

Besides the training of medical officers at the medical officers' training camps it later became necessary to respond to the request of the Dental Corps, Veterinary Corps, and Sanitary Corps to train their officers.³ Schools were accordingly established for this purpose, these nonmedical schools including separate schools for dental surgeons, veterinarians, sanitary engineers, psychologists, and nutrition experts. The courses were based on two months' training, and instruction was limited to the fundamental necessities of the individual service.³

Schools for the training of enlisted men in special work were early developed.³ These enlisted men's schools included those for the making of noncommissioned officers, nurses, and ward men, dispensary, laboratory, X-ray, and surgical assistants, clerks, cooks, chauffeurs, and gas-engine mechanics. Classes of medical officers and enlisted men in automobile maintenance were also maintained.

The medical officers' training camps were required to organize, maintain, and supply a large number of practically every formation which the Medical

Department provides.³ Some of these were permanently attached to the camps as training units, others were provisional organizations without official status but used for training purposes until needed for conversion into new official organizations. Still others were organized solely for the purpose of being sent away at an early or later date.

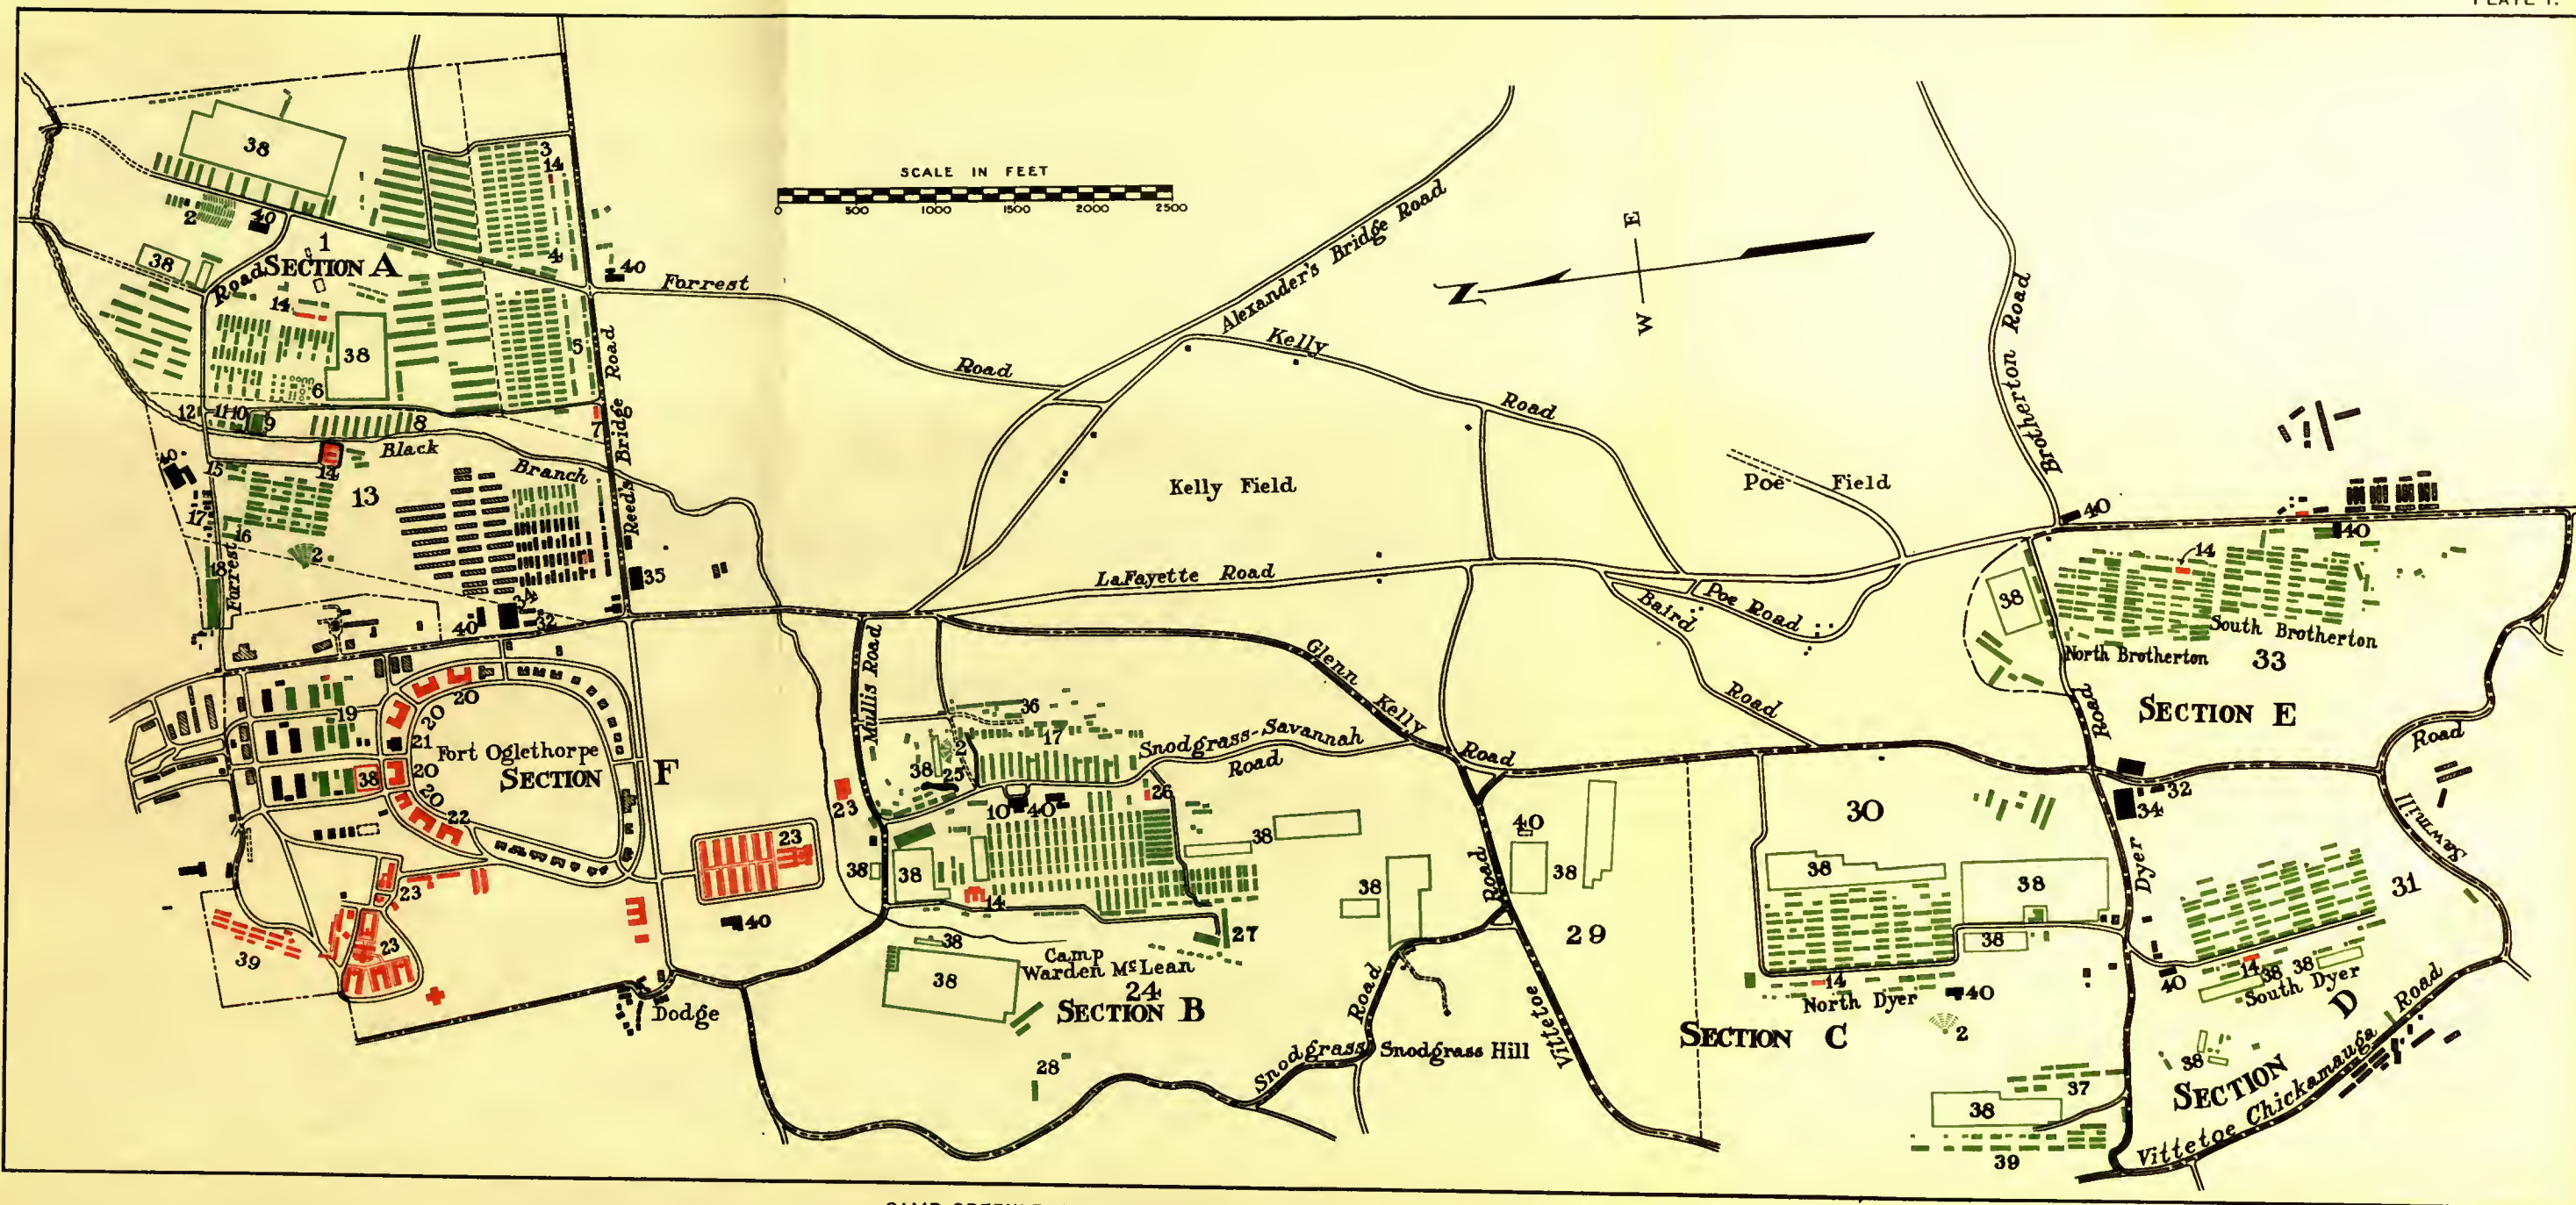

Besides the three training camps already mentioned, a similar camp was established at Fort Des Moines, Iowa, for the training of colored medical officers and colored enlisted men of the Medical Department. Its official capacity was 125 officers and 1,000 enlisted men, and it was in operation between July 21, 1917, and December 1, 1917, when the need for colored medical officers was satisfied. The training given in this camp was in regimental work only, as it was understood that colored sanitary personnel would habitually be attached to colored organizations. (See Chap. II, p. 262.)

The number of medical officers under training was sufficient to fill all drafts made on the medical training camps, but not sufficient to insure that officers so drafted would at all times be adequately trained. The needs of the Medical Department required that 3,000 medical officers, 500 officers of the Dental Corps, Veterinary Corps, and Sanitary Corps, and 35,000 enlisted men of the Medical Department should as a minimum be constantly under training. These numbers, however, were never attained during the war.³

From the foregoing it is seen that Medical Department training in the United States, as finally developed, was conducted in schools and organizations which may be considered under six groups: (1) Medical officers' training camps; (2) divisions camps, and posts; (3) United States Army hospitals; (4) special schools, (5) special professional schools in military and nonmilitary institutions; and (6) miscellaneous schools. These constitute the subject matter of the succeeding chapters.

CHAPTER II

MEDICAL OFFICERS' TRAINING CAMPS

CAMP GREENLEAF, GA.

CAMP SITE AND BUILDINGS

In May, 1917, it was ordered that a training camp for medical officers, to be known as Camp Greenleaf, be established at Fort Oglethorpe, Chickamauga Park, Ga., to be ready for occupancy on June 1.¹ The commanding officer reported for duty two weeks later.² Certain buildings had been authorized for the camp,¹ but up to the time of the arrival of the commanding officer no steps had been taken to even locate the future site of the camp.³ It was found that the only unoccupied ground to which water could be piped within a period of three or four weeks was a low spot east of the post of Fort Oglethorpe, in the center of which two ridges offered a fairly high and dry location upon which could be placed a few buildings.³ These hills were surrounded by what was practically swamp land, incompletely drained by a ditch. After heavy rains these swamps were sometimes covered with from 2 to 5 feet of water. It was discovered that this ditch could be widened sufficiently to provide adequate drainage for reclaiming all this land and making it suitable for building sites. To have accomplished this by hired labor would have involved a prohibitive expenditure of money.

In the light of all these facts a telegram was sent to the War Department requesting that students be not ordered to the camp until June 15.³ It was too late, however, and the student officers began to arrive June 1. The process of making this swamp land available for occupation furnished valuable experience in sanitation, and the project was completed as part of the instruction in sanitation and hygiene.³

The lumber for construction work was on the ground, but three days before the date set for the arrival of the first student officers (60 in number) no buildings were completed.³ No tentage was available, but a large force of carpenters of the Quartermaster Department so expedited the building operations that by the night of June 1 a floor with a roof but no side walls was provided.³ Eventually the entire area of low ground was covered with buildings and became fairly well adapted to the purposes of a camp site.³

Very shortly after June 1 a supposedly sufficient number of barracks with mess halls and lavatories were constructed to house 1,000 officers but their actual capacity was 650.³ Barracks for 150 men were erected for regimental detachments and others with a capacity of 800 men were provided for the prospective ambulance companies and field hospital companies.³ Later a comparatively level spot along the completed ditch was used as a parade ground for the training group, and special buildings, such as McLean Auditorium, the hostess house, and the camp library, were built along the ditch opposite the parade ground.⁴

ORGANIZATION

GROUP SYSTEM

The student officers were divided into companies and, wherever possible, company officers selected from among those who had received some previous training were assigned in excess of the normal requirements. The object of this was to have a cadet officer for every four cadets, so that these officers could conduct small quizzes within their companies.³

The formal course of instruction for student officers was inaugurated June 15. At that time there were present for duty 75 Medical Reserve Corps officers and 25 medical officers of the National Guard. Six officers of the Regular Medical Corps and one of the National Guard were available as instructors. At first instruction was given by Regular officers, but within a short time the most promising of the student officers were utilized as instructors.³ In the beginning they were employed largely as company officers, drill instructors, and quiz masters, but later they did excellent work as junior instructors.²

On arrival of enlisted men, who in the main were raw recruits, facilities for administrative work had to be provided for the proper and rapid training of these men.⁵ As this training, of course, was distinct from that of the officer, and as they were at that time not organized, a separate system had to be devised. This was called the group system, in which the camp was divided into groups; at first only two, the medical officers' group and the enlisted men's group.⁵ Each of these groups had more or less administrative independence and handled their affairs in a manner similar to a regiment in any of the cantonments for line officers.⁵

As the camp increased in size and as organizations were formed from these enlisted men and officered from the training companies, the number of groups increased and gradually the details of their administration were entrusted to them, with the camp headquarters exercising only general supervision. The camp increased very gradually up to the 1st of June, 1918, and, with this system, notwithstanding the defects which developed in the course of time, the situation could be satisfactorily handled.⁵

The group system was adopted because of its elasticity and because it allowed organizations requiring different forms of training to be separated.⁶ It permitted the training of an unlimited number of men in the various phases of the medico-military activities under one general control. As many groups as were warranted by the number of men to be trained could be formed; and when one became so large as to be unwieldy, it was broken up into two or more groups. Likewise, when a certain class of training was no longer desirable, the group could be enlarged readily to take up other training. This system of administration also relieved the general headquarters of nearly all specialized and routine administration and allowed the general policies of the camp to receive undivided attention.⁶

Within the groups the battalion, as the administration unit, was found preferable to the company, and nearly all organization work was done at the several battalion headquarters.⁶

In March, 1918, the group system having become unwieldy, to a certain extent, the groups containing motor field units, mule-drawn units, evacuation hospitals, and base hospitals were combined into what was called the division of hospitals and sanitary trains, with the division commander exercising tactical control, but with all administrative control still vested in the group itself, or the camp headquarters.⁶ In July, 1918, it was found that the group system, as then in vogue and as had been developed since the beginning of the camp, had grown to such an extent that the individual groups were almost entirely free of the vested authority of the camp commander, and a great deal of friction occurred between different sections of the camp for that reason. This being thoroughly understood, steps were taken by the headquarters of the division of hospitals and sanitary trains to coordinate the camp activities in that section and to weld these different groups together in such a way that, while interdependent, they would still have their proper amount of local autonomy, and the division commander was required to exercise very complete control of these separate units.⁵

In September, 1918, when the camp had attained its greatest size and potentiality for efficient work, the division headquarters was done away with, and each group was then distinctly dependent upon camp headquarters without any intervening authority.⁵ Camp headquarters was then to a certain extent reorganized, with a chief of staff, exercising the duties of his office; a camp adjutant, as had been constituted from the beginning; a camp personnel adjutant, with a distinct development of personnel activities and a concentration of these activities in the one office; the camp inspector, who, though not an officer from the Inspector General's Department, still acted in that manner for camp headquarters in the inspection of all matters arising; a camp surgeon, who had been in the original camp administration, but who had no control over sanitary trains, and other units, being concerned only with the health of the command and having direct supervision over the infirmaries in the several groups; a camp judge advocate, who was also the insurance officer, and who, though this camp had no court-martial jurisdiction, investigated all court-martial cases before they were sent forward; a camp supply officer, a discussion of whose duties will be taken up later.⁵

Effort was made in the final development of the groups to concentrate certain units in the groups which were best qualified to handle their training. For example, all motor units were concentrated in the motor group, where the school for drivers and mechanics was located.⁵ Though each group had its own administrative entity and was related to the camp headquarters in the same way as the individual regiments in the line cantonments, still great care was exercised in the final development of the camp to see that their independence was not such as to jeopardize the proper handling of the general policy of the camp.⁵ By careful instruction and supervision by the commanding officer and the staff of the camp, the relations among the several groups were made so strong that administrative control was simplified and made very effective.

At the time of the armistice these groups consisted of the following:⁵ (1) Medical officers' training group, containing all of the officers' training companies and the special schools for professional instruction for medical

officers; the dental school, for officers and enlisted men; the veterinary school, for officers and enlisted men. All officers reporting for instruction were assigned to the medical officers' training group, which was finally composed of nine battalions of four companies each, but this group could expand to any number of battalions if occasion demanded. (2) The sanitary units group (field hospitals and ambulance companies) for administrative purposes, which was divided at first into two battalions of four field hospitals and four ambulance companies. (3) The detention group, to which all drafted men were sent on arrival for their regular detention of two weeks. This was the same as the detention camp in the regular line cantonments, and was first designated the recruit camp. (4) The motor group, containing all of the motor units and the motor school (on account of a certain amount of crowding, some replacement units were formed in this group). (5) The noncommissioned officers' group, for the training of non-commissioned officers. (6) The replacement group, which, in general, acted in the same manner as the depot brigade of the regular line cantonments. Replacement units for overseas service were formed in this group. The development battalion was also under the commanding officer of this group. (7) The evacuation group, in which all evacuation hospitals and trains were consolidated. (8) The hospital group, in which were formed the base hospitals and convalescent camps.

In addition to the foregoing groups, the service company attached to headquarters carried in its personnel all the general clerical force, cooks, and janitors for the training companies, and men detailed for special instruction, as laboratory and X-ray technicians; the cooks' and bakers' school, where cooks and bakers were trained for the different organizations; the guard company, which guarded the camp and handled all prisoners confined therein; and the military police, exercising strictly military police functions.⁵

Recruits were first assigned to the detention group and remained there during their period of isolation and until their records were completed by the personnel office.⁶ On leaving the detention group, they were sent to the replacement group, and from there they were assigned to the other groups according to their occupational and physical qualifications.⁶ The most promising material was selected for possible noncommissioned officers and was assigned to the noncommissioned officers' group. Motor drivers, motor mechanics, and men of kindred trades were transferred to the motor group. Men who had received previous training as cooks, or those who desired this instruction, were assigned to the school for cooks and bakers. Those experienced in pharmacy, nursing, or similar occupations were sent to the hospital group. The remainder were divided, according to their physical qualifications, into general service or domestic service men, and held for training. Many men without special qualifications were necessarily assigned to organizations, but the system followed assured that all men who had any special qualifications would be assigned where these qualifications would be of the most benefit to the service. This system was frequently interfered with by a lack of sufficient time between the date on which men were received and that on which it was necessary to send them out in order to fill requisitions; also by organizations being ordered formed and sent out without sufficient time elapsing to properly train the

personnel; and frequently by calls for unqualified men in such numbers that those trained or partially trained for special service had to be called upon to fill them; but as near an approach to the system as outlined, as circumstances permitted, was made.

ADMINISTRATION

As finally constituted the administrative control of the camp was excellent, the machinery ran very smoothly, and an immense amount of business was transacted with a camp administrative force much smaller than was usually allotted to the regular divisional cantonments of about equal size.⁵ There were several administrative defects, the source of which was not within the jurisdiction of the commandant, and which were not easily eliminated.⁵ All court-martial cases had to be sent to headquarters, Southeastern Department, and the delay in trial amounted at times to as long a period as six weeks to two months. This caused the guardhouse to be constantly crowded with prisoners awaiting trial or awaiting sentence, which added a great deal to the administrative difficulties and to the duties of the guard company. It also caused constant complaint from friends and relatives of prisoners on account of the delay in disposition of these cases.⁵

Efforts were made constantly to assign the drafted personnel to units according to the approved trade classifications issued by the civilian committee on personnel.⁵ This distribution of personnel could not be followed as completely as desired, for the demands on the camp for replacement and other units for overseas service were so great that very few men were able to remain in camp long enough to be properly classified and disposed of. After the 1st of October, 1918, this classification was more thoroughly carried out, as the influenza epidemic cut short the rapid shipments overseas. In camps of this size organized for technical troops it was not considered that a central personnel office would make the proper assignments according to trade classifications, but a branch office established in the replacement group acted much more efficiently in the assignment of men, particularly as it was found that reclassification had to be made constantly.⁵

One difficulty in administrative control, which was more annoying than of great moment, arose in consequence of the continuance of the post of Fort Oglethorpe, surrounded by Camp Greenleaf. At this post, in cantonment barracks, there were some 3 to 5 troops of Cavalry, and the command of the post was vested in the commanding officer, Fort Oglethorpe, while the post headquarters and a few officers' quarters, as the remainder of the post proper, had been turned over to General Hospital No. 14.⁵

The administrative defect of greatest importance was the complete separation of the supply department from the control of the camp commander. No camp supply officer was provided by orders from the War Department, and the camp supply service was under the control of the subdepot of the Quartermaster Corps, located at Lytle, Ga., 4 miles distant. A great deal of friction was caused by a lack of cooperation on the part of the supply department with the camp headquarters, and frequently supplies requisitioned by the units of the camp were disposed of in a way which was not to the best

interest of the service.⁵ A great deal of delay was caused in proper shipment of troops overseas by the fact that clothing and other equipment was handled too slowly and sufficient supplies were not kept on hand to properly equip troops when called for. Every effort was made by camp headquarters to overcome this defect, but without success, and when cases of lack of cooperation were reported to the War Department weeks elapsed before these could be corrected.⁵ A change in the officer in command of the subdepot, in September, 1918, assisted materially in the better handling of this work, as the officer put in command was more willing to do what was right and proper in the equipment of the units shipped out; but his lack of experience in the service still caused considerable friction.

There was no utilities department at Camp Greenleaf until October of 1918, and that department never really became properly organized, so the camp supply officer, who was an officer of the Quartermaster Corps detailed at the station, by camp orders, handled the utilities work in the main very successfully.⁵

Though the proper functioning of the camp as a whole suffered constant setbacks, owing to the inevitable lack of knowledge of its size and construction on the part of higher authority, there was nevertheless attained a smoothness and efficiency of local administration. With the exception of group commanders, most of the officers were either reserve officers or young Regulars of a few months' service.⁵

On July 1 Field Hospital Companies and Ambulance Companies Nos. 21, 22, 23, and 24 were organized, but these numbers were changed later to 20, 22, 23, 25. The commissioned personnel of these companies came from the student body.³ The enlisted personnel were drawn from the recruit camp.³ A personnel sufficient to form nuclei for the sanitary trains and regimental detachments of the 78th Division, Camp Dix; 79th Division, Camp Meade; 88th Division, Camp Lee; 87th Division, Camp Gordon; and the 81st Division, Camp Jackson, were sent out August 25 and 26, 1917.³

The enlisted personnel for these units was taken from the companies which were organized in July, and when they departed provisional companies were immediately organized from recruits.³ Assistance was rendered during the organization period by officers of the National Guard stationed in this camp.³

September 7 and 8 an ambulance company and field hospital company were sent to the 77th Division at Camp Upton.³ Ambulance Company No. 23 and Field Hospital Company No. 23 were sent to the port of embarkation, Hoboken, N. J., the last of October, for service overseas.³ During October a camp was maintained at Catoosa Springs, Ga., a few miles away, where the ambulance companies went into camp for varying periods.³ On November 1 the field hospitals, ambulance companies, and the base hospital group were combined to form the sanitary units battalion.³ In November, 1917, after the closure of the Medical Officers' Training Camp at Fort Benjamin Harrison, a number of the officers who were instructors at that camp came to Camp Greenleaf for duty.⁶ About this time six Cavalry stables in the post of Fort Oglethorpe were converted into barracks for 100 men each; storehouses, ambulance

sheds, and sheds for animals were also built.³ An officers' building to furnish quarters for instructors was constructed, and later a building for a mess, with servants' quarters attached.³ All other personnel for some time were quartered in tents. No central heating plant was constructed, but all barracks and other buildings were heated by small stoves.⁷

Throughout the life of the camp the housing problem was a serious one. All available shelter, such as stables and sheds, was used, but at no time were there sufficient accommodations for the number of men sent to this camp.⁶

Part of the reserve officers' training camp, Camp Warden McLean, Ga., with a capacity of 1,500, was turned over to Camp Greenleaf November 27, 1917, and was occupied by motor field units.⁶

Up to January, 1918, the camp remained comparatively small, having contained a maximum of 1,087 officers and 3,757 enlisted men at any one time.⁶

During the period between the opening of the camp and January 1, 1918, 11,916 officers and men had been received and 7,072 sent out. Ten ambulance companies, ten field hospital companies, one evacuation hospital, and forty-five regimental detachments were ordered from the camp during this period.⁶

The winter of 1917-18 was the most severe on record in this latitude. The thermometer was frequently down to zero and there were many heavy rain and snow storms. Housing conditions were quite inadequate, and what accommodations existed were very poorly adapted to weather of such severity. Clothing for the enlisted men was very scarce, and woolen clothing and rain-coats were unobtainable. Even wood for fuel was difficult to obtain. The result was that the troops suffered considerably; but with all these discomforts, the health of the camp was extremely good.⁶

Means of communication with the city of Chattanooga were very inadequate in the early days, especially after the advent of severe weather. The road was almost impassable at times, and during a part of the winter the electric line leading to the city was entirely paralyzed on account of a street-car strike, combined with a rise in the Tennessee River. As Chattanooga, 8 miles distant, was the nearest railroad station, except a small branch line at Lytle, Ga., 5 miles from the camp, the situation was quite uncomfortable. These conditions naturally interfered with the administration of the camp to a great extent. Communication was later greatly improved by the construction of a concrete road from Chickamauga Park to Chattanooga.⁶

In February, 1918, the cantonments formerly occupied by the 80th and 81st Field Artillery Regiments were turned over to Camp Greenleaf. These cantonments had a capacity of 1,760 men each.⁸ Up to this time the number of student officers present filled not more than five battalions, but the strength of the department steadily increased, and in this month two more battalions were organized. The 7th Battalion was filled with Veterinary and Sanitary Corps officers. Later the dental officers were placed in this unit.⁸ In February, 1918, the McLean Auditorium was completed. This provided a much-needed lecture hall, as all instruction had previously been given either in the open or in small rooms. The funds needed for the erection of this building were derived from private sources.⁹ The early part of 1918 marked a continuation of the growth

of the camp, which more than doubled during the first three months, the commissioned and enlisted personnel amounting to 10,469 on March 31.⁶ The training of medical officers received a definite stimulus when General Hospital No. 14 was put under the command of the camp commander March 15, 1918. The hospital had formerly been the post hospital, but by War Department orders was designated General Hospital No. 14, and the commandant, Camp Greenleaf, was designated as commanding officer.^{10 6} It was also enlarged to a considerable extent, and thereby played an invaluable part in the training of medical officers in the special schools, and enabled the instructors to combine practical clinical work with theoretical instruction. After that time General Hospital No. 14 was the center of instruction in most of these courses, and by maintaining an excess staff composed of student officers, much valuable training along practical lines was possible. Clinical material was always abundant, as all cases requiring hospital treatment arising in Camp Greenleaf or the other adjacent camps were treated there.⁶

In March the first draft of 7,747 men was received. Prior to this time increments to the camp had been in small numbers and had come either from recruit depots or by transfer from other camps. The arrival of these men from civil life necessitated that the physical examination and other work connected with the draft be carefully organized.⁶

For some time there had been great difficulty in obtaining a sufficient number of officers for the various field details, principally on account of the fact that the specialists divisions of the Surgeon General's Office would not permit officers reserved for these specialties to be detailed to other work, regardless of their qualifications.¹¹ This condition necessitated considerable correspondence between the commandant of the camp and the heads of divisions in the Surgeon General's Office.¹¹ A satisfactory arrangement was finally made, and the following instructions were issued by the commandant to the commanding officer, student officers' group, on April 17, 1918:¹²

1. No officer will be noted as held as a specialist without such instruction from the Office of the Surgeon General. When information is received from one of the divisions in the Office of the Surgeon General that an officer is to be held for some specialty, he will be immediately examined as to his qualifications in that specialty, and the recommendation made to these headquarters. This will be forwarded to the Surgeon General for decision, pending which the officer will be held for the specialty as first indicated.

During May, 1918, the cantonments previously occupied by the 6th and 11th Infantry and the remainder of the Reserve Officers' Training Camp, Camp Warden McLean, were occupied.⁶

During the remainder of the life of the camp it absorbed all the cantonments formerly occupied by the line troops, except what was known as the Viniard and Wilder section, and all of the cantonments previously occupied by the 11th Cavalry, excepting space necessary for the housing of one squadron. This latter cantonment was turned over to the camp in September. The recruit cantonments immediately north of General Hospital No. 14 were also turned over to the hospital in September, 1918, and were used by it thereafter as barracks for the permanent enlisted personnel on duty at the hospital, thereby giving more bed space for sick in the hospital proper.⁶

Up to the latter part of May, 1918, the flow of medical officers through the camp was comparatively regular, an average of 585 per month reporting and 513 departing.⁶

The movement of enlisted men and completed organizations showed little increased activity during this period (April and May), only 8,629 men being received in addition to the March draft. During this time 4 base hospitals, 3 evacuation hospitals, 1 field hospital, 8 hospital trains, 1 ambulance company, 1 evacuation ambulance company, 3 convalescent camps, and 6 sanitary squads departed, and each month a replacement draft of approximately 200 men was called for. The increasing size of the camp requiring a proportionate increase in the permanent cadre, together with the number who were in training as specialists in hospitals and other organizations, made it extremely difficult to supply the men required for replacement units and untabulated detachments.⁶ Many trained units which had been organized had to be stripped to supply the men. This was a decided disadvantage and necessarily told against the efficiency of the completed organizations.⁶

With all the demands for officers and enlisted men to fill these requisitions, there was, in June, 1918, no definite pronouncement in regard to the expansion of the camp.¹³

The increasing need for additional personnel in the permanent cadre of the camp is shown very clearly by a description of the constitution and duties of the service company which was organized May 6, 1918.¹⁴ The service company, which was the largest single organization of enlisted men in Camp Greenleaf, was formed by a merger of Headquarters Company No. 1, Sanitary Company No. 1, and the infirmary detachment, with a personnel of 4 officers and 569 enlisted men. It was expanded by 127 men and was augmented by transfers to and from the command until it had 3 officers and 696 enlisted men.¹⁴ The chief reason for the gain was due to the rapidly developing activities of Camp Greenleaf and the constantly increasing demand for service. The company supplied men to operate the camp headquarters, the camp infirmary, personnel office, quartermaster office, quartermaster storeroom, quartermaster shops, 6 post exchanges, 16 mess halls, the commissary, Camp Greenleaf post office—also the military post office at Lytle—25 men for military police duty in Chattanooga, Tenn., and the post, and also had the entire sanitary work for the training group.

During the month of July, 1918, the long contemplated merger of the Medical Officers' Training Camp at Fort Riley with Camp Greenleaf was consummated by the transfer to Camp Greenleaf of 65 medical officers and 322 enlisted men, including the excellent Fort Riley band.⁶ The greater number of these officers were detailed as instructors. The remainder were assigned to administrative duties.⁶ During the latter part of August and the 1st of September large numbers of enlisted men were received from the post, and when the need for space became very acute a special investigation of the situation was made by the General Staff, and it was proposed to acquire a tract of land to the south of Chickamauga Park and thereon erect a cantonment with a capacity of 10,000 men.¹⁴ This was approved throughout until considered by the War Labor Board, which disapproved the project on account of the difficulty in obtaining sufficient labor to construct the cantonment.¹⁵

The influenza epidemic made its first appearance at Camp Greenleaf September 25, 1918, 26 cases being reported that day.⁶ During the month of October the epidemic reached its height and disappeared completely by the 26th of the month. During this time there were 2,353 cases of influenza and 1,200 cases of pneumonia admitted to the hospital. Most of the latter entered as influenza cases. The deaths numbered 325. Approximately 25 per cent of the pneumonia cases terminated fatally. The epidemic greatly interfered with the activities of the camp; few men were received during the period and few organizations departed.

During the period June 1, 1917, to November 30, 1918, 6,640 officers and 31,138 enlisted men were received and 4,318 officers and 22,161 enlisted men departed during the same period.⁶ The average monthly strength was 2,619 officers and 17,441 enlisted men. During this period the following organizations were completed, equipped, and most of them departed from camp: 63 base hospitals, 37 evacuation hospitals, 5 field hospitals, 13 hospital trains, 5 ambulance companies, 21 evacuation ambulance companies, 9 convalescent camps, 10 replacement units.⁶ In addition to these, numerous detachments were also sent out.

The latter half of the year 1918 was an era of progressive growth in extent, activities, and usefulness of the camp. This abundantly filled the hopes and exceeded the expectations of those who had shared in its development. During the latter half of this period the influenza epidemic seriously curtailed activities, but except for the temporary check the business of training officers and enlisted men, forming organizations, and filling War Department requisitions for troops was carried on with a maximum of efficiency and achievement.⁶ Many factors contributed to this result. The intelligent and willing cooperation of officers and men was probably the chief contributing feature. The administrative system developed and perfected through 12 months of experiment had finally become clearly defined and was being carried out with considerable success. During this period the system proved itself capable of absorbing thousands of men within very short periods of time and assimilating them without effort; also of dispatching equal numbers of trained soldiers and organizations without in any way disrupting the training and other activities of the camp.⁶

TERMINATION

The middle of November, 1918, practically terminated the activities of Camp Greenleaf, as far as its original purpose was concerned, although a few more officers and enlisted men were received and some ordered out, and the training program was continued throughout the month.⁶ The end was approaching, however, and demobilization was the growing consideration. During the latter part of November and all of December demobilization was carried out as rapidly as facilities would permit, and it was completed early in January, 1919. Camp Greenleaf had been designated in War Department orders as a general demobilization camp,^{6 16} and on December 18, 1918, command for this purpose was assumed, which event may be taken as the definite termination of the activities of the camp as a medical training camp.⁶

HEALTH

The health of Camp Greenleaf was universally good, despite rather trying conditions, caused by poor housing and overcrowding, as may be judged from the following tabulation:¹⁷

[Enlisted men only, 1918]

	Number	Rate
Admissions.....	8, 271	699.15
Deaths.....	134	11.33
Discharges.....	273	23.07
Noneffective.....	68, 732	15.92

TRAINING GROUPS

MEDICAL OFFICERS' TRAINING GROUP

All officers reporting for the course of instruction were assigned to the medical officers' training group, which was composed of 9 battalions of 4 companies each, but which, when occasion demanded, could be increased to any number.⁶

The group was an administrative entity and had disciplinary control of all student officers. Though professional examinations of all student officers had been held for some time in this group, this examination was made official by the Surgeon General in April, 1918, and a regular report was rendered monthly.¹¹ The following is an example of such a report and shows the general professional distribution of the officers reporting for instruction:¹⁸

The following is the report of the classification of incoming student officers for the month of October, 1918, with their respective grades.

SANITARY UNITS GROUP

On November 1, 1917, the field hospitals, ambulance companies, and base hospital group were combined to form the sanitary units group.¹⁹ For administrative purposes this was considered as 2 battalions of 4 companies each. The 4 ambulance company units and the 4 field hospitals had each a provisional director. Each company had its full complement of student officers and under the direction of the provisional director, performed every function required of a company in the field. Mess accounts, clothing requisitions, sick reports, etc., were made in each company under the guidance of the director. The group commander, in turn, served as a mentor of the directors and prepared, by correction or by consolidation of requisitions, reports, and returns, all papers that left the group for forwarding to the camp commander.¹⁹

Instruction, other than practical work within companies, was conducted under the regulation of the group commander, whose relation to the various organizations was identical with that assumed by the commandant to the various groups of the camp. The unit group, therefore, was largely independent. Indeed, effort was made to increase in every way the responsibility of the group commander, who was judged by this output rather than by the methods he employed.¹⁹

While the group commander had full charge of the instruction of his officers, the commandant required him to see that all of his officers kept up with the central basic course. Usually one or more officers of the group attended these lectures, and they instructed the other officers of the group by night quizzes. The special courses given by the group commander and his staff therefore, were, extra and additional to the main basic course taken by all student officers. The programs adopted for these courses were examined and approved by the commandant before they were put into effect. Thus the commandant was able to to unify and coordinate special and basic courses.¹⁹

The student officers in this group were under the direct control of the group commander and the assignments made to the group were considered as permanent. The numbers assigned were always in excess of requirements, so

that when a company left, its place could be filled immediately by a fairly well trained personnel of officers and noncommissioned officers.¹⁹

This group remained intact only one month, when it was divided into two groups, one containing the motorized companies and the other the animal-drawn companies.³

HOSPITAL GROUP

The first base and evacuation hospitals at Camp Greenleaf were formed in Battalion No. 14, located in the medical officers' training camp. Later, Battalion No. 14 was moved to the southern end of Chickamauga Park, occupying barracks and quarters vacated by line troops, and became known as the hospital group of the division of hospitals and sanitary trains.²⁰ In July, 1918, the group was divided into the base hospital group and the evacuation hospital group, each having its own camp site. Fifteen evacuation hospitals and several hospitals trains were formed in Battalion No. 14 and the hospital group prior to this date.²⁰

The base hospital group organized base hospitals, convalescent camps, and convalescent depots, and also furnished a large overseas replacement unit. There were organized and forwarded from the group 63 base hospitals and 11 convalescent camps; 14 base hospitals and 6 convalescent depot sections were formed but did not leave camp.²⁰ The organization of the group consisted of: Headquarters; supply department; mess department; camp infirmary; sanitary inspector; recruit section; hospital section.²⁰

Headquarters.—The commanding officer, adjutant, personnel adjutant, and three headquarters companies, to which the permanent cadre and casuals were assigned, constituted headquarters. When the group was divided, Headquarters Company No. 3 was transferred to the evacuation hospital group together with the evacuation hospitals and hospital trains already formed.⁶

The personnel adjutant had an assistant, and a relatively large office force was found necessary to handle promptly the records of the men who passed through the group. During its most active week 37 different organizations entrained and left the group.⁶ The paper work incident to this movement was very great, and was accomplished in a satisfactory manner.²⁰ An especial effort was made to have the service records and pay cards complete and accurate before they were forwarded. From various causes they were often defective when received, and this was a source of much trouble.²⁰

Supply department.—The group supply officer was accountable for the local camp property; issued clothing and equipment to the different organizations; paid the troops, and cooperated with the Camp Greenleaf troop-movement officer in arranging transportation for outgoing organizations. Several warehouses were used to store the necessary clothing and equipment. A special room was devoted to fitting shoes.²⁰ Motor trucks were assigned to the group and reported from the motor group when needed. Animal-drawn transportation and a number of saddle horses were kept in the group stables.

Mess department.—A group mess officer was appointed from the permanent cadre, with supervision of all messes and purchase and issue of stores. Subsistence stores were drawn from the central depot on a consolidated ration return for the group, or purchased in open market, kept in a special storehouse and

issued to the local messes.²⁰ A number of well-qualified cooks were part of the permanent cadre of the group. When a new organization was formed, two of these cooks were temporarily assigned to it, and they trained and assisted the cooks of the unit, which also furnished the kitchen police. The same bill of fare was served in all messes. Organizations which were designated to complete their training at Camp Greenleaf were required to operate their messes and manage their mess funds. All mess funds were audited monthly by a board of officers appointed from the group headquarters. Organizations leaving the group were given their pro rata share of the general mess fund, and were required to certify that they had no outstanding debts.²⁰ The group surgeon had charge of the infirmary and held sick call. All hospital cases were transferred to General Hospital No. 14, Fort Oglethorpe. The physical examinations of the men, which were frequently made, were made by the officers of the different organizations. The influenza epidemic of the fall of 1918 called into being a large tent isolation camp, which was set up adjacent to the group camp, and operated by officers and men detailed from the group. From this hospital only the severe cases were transferred to General Hospital No. 14, and there were no local deaths.²⁰ The sanitary inspector supervised the sanitation and police of the camp and the operation of refuse incinerators. Garbage was hauled away by a contractor. Extensive work in ditching, filling, and oiling was done for mosquito control. The commanding officer of each organization was made responsible for the sanitation and police of the barracks occupied by his men and also the mess hall and kitchen. Food waste was rigidly controlled by checking the amount of food issued to the mess and the amount of garbage. An examination for carriers was made of cooks and other handlers of food, and a hookworm survey was made of men coming from infected districts. With the exception of the influenza epidemic of October, 1918, the general health of the command was excellent.²⁰ All cases of contagious disease were promptly removed and isolated, and the men in the barracks from which the case was taken were quarantined as a unit, drilling and messing apart from the rest of the command.

Recruit section.—The administrative organization of the group was developed and modified to meet the changes which occurred in the camp at large, and the duties devolving on the group. At first a recruit section was maintained at which recruits were held and outfitted before being assigned to their organizations. Later, when the detention camps and replacement group at Camp Greenleaf handled all of the inducted men, the recruit section functioned, with a reduced personnel, as a receiving section, and enlisted personnel for the formation of new units was requisitioned from the replacement group.²⁰ A permanent cadre of officers and enlisted men was maintained and furnished the staff of the group and instructors for newly formed units.

Hospital section.—Base hospitals, convalescent camps, and convalescent depots were organized in compliance with orders from the War Department, which gave their numerical designation, prescribed their strength, and assigned the commissioned personnel.²⁰ Most of the units were organized at reduced strength and then sent to general hospitals about the country to complete their complement of men and receive practical training in hospital work. The

additional personnel required to bring them to full strength was obtained from the general hospital to which they were attached, or, in several instances, forwarded from Camp Greenleaf.²⁰ Delay in appointing the commanding officer and administrative staff of a new organization, and their absence when the unit was formed, was a handicap frequently encountered. These officers were appointed but often did not join their organization until after it had left Camp Greenleaf.²⁰ When the group received orders to form a new unit, the enlisted personnel was requisitioned from the replacement group, a provisional staff of officers, noncommissioned officers, and cooks was detailed from the permanent cadre of the group, and intensive training was begun immediately. Due to the fact that units left the group at irregular intervals, and often very quickly after they were organized, no set schedule could be maintained. In general, however, the forenoon was devoted to drill and one lecture and the afternoon to a hike, during which practical work was done in litter bearing and first aid and instruction given in sanitation and personal hygiene. Officers and noncommissioned officers were instructed in the preparation of records, official correspondence, supply, and mess management.²⁰ A guard was mounted daily, and the fire apparatus was manned by a special detail.²⁰ Athletics were encouraged, and physical training under a special instructor given daily. Numerous baseball and football games were played between teams in the group and teams from other groups. A large covered stage was built, and in the evenings boxing and wrestling matches were held, and vaudeville acts put on by local talent or teams from Camp Greenleaf.²⁰

The group ceased to function in December, 1918, preceding which date large detachments were forwarded to man three newly formed general hospitals.²⁰

The following base hospitals were organized at Camp Greenleaf:²¹ Base Hospitals Nos. 51, 52, 53, 55, 56, 57, 59, 60, 61, 62, 63, 64, 69, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 91, 92, 98, 100, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 123, 124, 125, 126, 127, 128, 129, 130, 132, 133, 134, 135, 136, 137, 138, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, and 161.

MOTOR GROUP

On July 1, 1917, 800 enlisted men and 40 medical officers were assigned by orders from camp headquarters of the Medical Officers' Training Camp, Fort Oglethorpe, Ga., for the formation of ambulance companies and field hospitals.²² The instructions directed the formation of animal-drawn and motor companies in equal numbers, and six ambulance companies were organized and equipped in six weeks. At the termination of the first six weeks period, orders were received to send the companies already organized to the various camps, where divisions were being formed, retaining a small percentage of the officers and men as a nucleus for additional companies. The original number of officers and men had been reinforced by additional allotments. Six additional field hospitals and six additional ambulance companies were begun at once on the basis of two animal-drawn to four motor vehicles.²²

On November 1, 1917, the field hospitals and ambulance companies were combined to form a sanitary units battalion.¹⁹

About this date, a number of the companies of the second group organized, were sent to camps, as a basis for the formation of divisional sanitary trains, and on November 25, 1917, several ambulance companies and field hospitals joined the camp from Fort Benjamin Harrison.²² At this date, the command was separated, so that the animal-drawn units, which constituted one-third of the command, became a separate section of the camp, and the motor units formed a section which was called the motor camp, Camp Greenleaf.²² At this same time the motor units moved to another part of Chickamauga Park, taking over one-half of the reserve officers' training camp, Camp Forrest. There were then 12 field hospitals and 12 ambulance companies, motorized, and 4 evacuation ambulance companies, motorized, in this group.²²

On January 7, a department of transportation was organized and divided into three parts: First, a school of motor instruction; second, a repair shop; and, third, a service department.²³ A permanent working force of noncommissioned officers and mechanics was transferred from the various companies for duty in the motor department. Truck, ambulance, motor car, and motor cycle drivers were detailed semimonthly from the various companies for four weeks' duty in the motor department. These men took care of the routine work of Camp Greenleaf and Camp Greenleaf annex, and constituted the service department.²³ The repair department and the school for motor instruction jointly did the repair work for the transportation assigned to this command.²³ The school of motor instruction was intended to instruct truck drivers who had graduated from the service department in handling the trucks assigned to their organizations. The school also instructed ambulance and truck repair men in making minor repairs, replacing broken parts, and locating trouble in unserviceable cars. The purpose of this school was to insure that every motor company leaving the command would have its full quota of repair men and chauffeurs. Special instruction was given motor-cycle operators and repair men.

At this time the field hospitals and evacuation ambulance companies battalion, consisting of 8 field hospitals and 2 evacuation ambulance companies, were in training.²⁴ These companies were taught proficiency in the school of the soldier, litter bearer drill, tent pitching and striking, individual cooking, transmission of messages, first aid, and the establishment and operation of complete field hospitals and stations for slightly wounded. Practice marches were also held. In addition, schools were conducted for instruction in operating-room technique, pharmacy, ward management and nursing, the administration of drugs, truck and ambulance driving, including the care of equipment and making repairs.

Schools for noncommissioned officers were in operation for instruction in administration, property, mess management, and sick and wounded report.²⁴ Evening talks and demonstrations were given to the enlisted men. Interesting articles were read to them and effort made to direct their minds in proper channels. French classes were conducted for both officers and enlisted men.

An advanced school for officers was conducted by this group, and two hours each day were devoted to lectures.

A camp infirmary was operated under the direction of the field hospitals.²⁴ A ward was connected with the infirmary for the care of the sick in quarters,

where the men were taught the principles of ward nursing. Two officers were assigned by roster each day to assist the camp surgeon in taking sick call. These officers were taught the management of sick call and details of the sick and wounded reports.

To secure the necessary flexibility of schedule, to permit the necessary preparation for exercises, and to provide against waste of time, 165 hours were assigned to the ambulance companies, as follows:²⁵

	Hours
Allotted to drill and field work.....	120
Allotted to demonstration and deductive teaching.....	45
Total.....	165

Each company which had more than its tabular quota of officers detailed one personnel officer whose duty it was to attend all didactic lectures and assist in all demonstrations and practical class work. He reported to the company commander upon the work of the class and upon individuals who attracted attention for any reason. In the absence of such an officer, the sanitary officer of each company assumed these duties.

An informal written quiz was given at the close of each week covering the subjects taught during the week.²⁵

The company commander was responsible for the use of all available time, adapting instruction to conditions as they arose.²⁵ He assigned the drills and subjects of instruction at least one week in advance in order that no officer would be obliged to conduct a lecture, drill, or demonstration without ample preparation. He was responsible for maintaining a proper sequence and balance of instruction, and to this end kept a daily log of instruction and drill, which was open to inspection at any time. The company commander also kept an individual record of (a) previous education, (b) special qualifications, (c) ability, (d) class work, besides any special data which he might wish to compile. This record was made in consultation with junior officers and first sergeant.

Drills: ²⁵	Hours
1. Setting-up exercises.....	12
2. Foot drill (school of the soldier, school of the squad, company drill).....	30
3. Field exercises (route marching, camp pitching, battle service).....	27
4. Litter bearer and ambulance drill.....	10
5. Shelter-tent drill.....	10
6. Pyramidal and wall-tent drill.....	8
Total.....	120

Didactic and demonstrations:²⁵

1. Articles of War.....	1
2. Military discipline and courtesy.....	1
3. Camp regulations.....	1
4. Personal hygiene and care of the feet.....	1
5. Venereal prophylaxis.....	1
6. Infection and disinfection.....	1
7. Means of transmission and prevention of disease.....	1
8. Camp and field sanitation.....	1
9. Water, air, and ventilation.....	1
10. Outline of sanitary service in war and functions of an ambulance company.....	1
11. Equipment of a sanitary soldier.....	1

Didactic and demonstrations—Continued.	Hours
12. Care of equipment and property.....	1
13. The skeleton, muscles, skin.....	1
14. Nervous system and special senses.....	1
15. Digestive apparatus.....	1
16. Blood and circulation (lymph system).....	1
17. Respiratory and excretory apparatus.....	1
18. Principles of first aid; emergencies, contusions, wounds.....	1
19. Hemorrhage.....	1
20. Dislocations and sprains.....	1
21. Fractures.....	1
22. Insensibility.....	1
23. Asphyxia and resuscitation.....	1
24. Gas.....	1
25. Bandaging and nursing.....	8
26. Improvised splints and litters.....	1
27. Allen's methods.....	1
28. Field cooking.....	1
29. Guard duty.....	1
30. Messages.....	1
31. Semaphore signals.....	3
32. Weekly written quiz (½ hour).....	3
Total.....	45

Early in February, unfortunately for training, it was necessary to send many men from this camp, the command losing about 40 per cent of its enlisted personnel. Numerous details made necessary by road construction, the hauling of fuel, and the construction of a new tent camp for a prospective influx of recruits, brought formal company instruction of these companies to a standstill.²⁵

In April, 1918, the question of the large number of motor drivers and mechanics required for the Medical Department was very carefully considered,²⁶ and brought forth the following correspondence:

HEADQUARTERS MOTOR SANITARY UNITS,
Camp Greenleaf Annex, Chickamauga Park, Ga., April 18, 1918.

From: Commanding officer.

To: Surgeon General, United States Army, Washington, D. C.

(Attention Colonel Munson, through the Commandant, Camp Greenleaf).

Subject: Motormen required for Medical Department.

1. Complying with verbal instructions of the officers addressed, an estimate of the number of motormen required for the Medical Department is hereby submitted. This estimate is based upon a proposed strength of 200,000 enlisted men in the Medical Department, and is computed with the view to the needs of an Army extending from the firing line to base:

(1) Ambulance drivers.....	10, 000
(2) Truck drivers.....	8, 000
(3) Mechanics.....	5, 200
(4) Motor-cycle drivers.....	3, 400

M. ASHFORD,
Lieutenant Colonel, Medical Corps, U. S. A.

[First indorsement]

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., April 24, 1918.

To the SURGEON GENERAL OF THE ARMY
(Attention Colonel Munson).

1. Forwarded, approved. It is believed that this estimate is as accurate as can be determined at the present time.

H. P. BIRMINGHAM,
Colonel, Retired, Commandant.

[Second indorsement]

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
April 29, 1918.

To Colonel WOLFE, *Supply Division*.

1. Referred with request that he comment on the above estimate. This estimate was made as a result of a request by me to the officers at Fort Oglethorpe who have charge of motor work, that they make suggestions as to the number of men who, in their opinion, should be trained in gas engine and chauffeur work for service in the Medical Department.

2. Based on your wishes in the matter, we desire to establish at the M. O. T. C., Fort Oglethorpe, such facilities as will produce in a given time such proportion of total required as may be necessary to meet current needs.

By direction of the Surgeon General:

E. L. MUNSON, *Colonel, Medical Corps*.

[Third indorsement]

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
May 13, 1918.

To Col. E. L. MUNSON, *Medical Department*.

1. Returned.

2. The Medical Department will have in operation by June 30, 1919, according to the proposed expansion of the Army, tentative strength table, serial No. 10-D, compiled March 19, 1918, by R. W. T., approved, M. C. L., March 19, 1918: 5,808 ambulances, 3,473 motor cycles, 1,700 motor trucks, 500 touring cars.

3. In order to provide a sufficient number of drivers for these vehicles, there should be available by that time 15,000 ambulance drivers, 8,000 motor-cycle drivers, 7,000 truck drivers, 500 touring-car drivers.

4. This will require the training of 1,200 ambulance drivers, 650 motor-cycle drivers, 600 truck drivers, and 40 touring-car drivers per month from June 1, 1918, to June 30, 1919. This gives a total of approximately 2,500 to be trained each month.

5. Allowing two mechanics for each motorized ambulance company and each motorized field hospital, will require approximately 500 during the same period for duty with the respective companies. There should be available at least 200 additional to care for motor vehicles of base and evacuation hospitals, regimental and other organizations whose machines are not kept in repair by ambulance company and field hospital company mechanics.

EDWIN P. WOLFE.

[Fourth indorsement]

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
May 14, 1918.

To Col. E. L. MUNSON, M. C.,
M. O. T. C., Fort Oglethorpe, Ga.

1. For comment and suggestions.

[Fifth indorsement]

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., May 18, 1918.

To Col. HENRY PAGE, M. C., U. S. Army, and to Lieut. Col. MAHLON ASHFORD, M. C., N. A.

1. Forwarded in turn for comment and return to these headquarters.

[Sixth indorsement]

HEADQUARTERS MOTOR SANITARY UNITS,
Camp Greenleaf Annex, Chickamauga Park, Ga., May 20, 1918.

To Col. HENRY PAGE, M. C., U. S. Army.

1. That portion of Camp Greenleaf, formerly reserve officers' training camp and now designated as Warden McLean division, medical officers' camp, is now assigned to motor sanitary units. These cantonments, together with outlying tent camp, have an approximate capacity of 4,000 men, which is ample to supply the Medical Department with the quota indicated by Colonel Wolfe, provided the requests from this office are granted.

2. The purpose of this special portion of Camp Greenleaf is considered by me to be the following:

To receive all enlisted personnel intended for motor training; uniform, examine, equip, vaccinate, classify said personnel; give a preliminary training during period of equipment and classification; and send out men under one of the following classes: (a) For base machine shops or base repair work, (b) field repair men, (c) competent drivers and emergency repair men, (d) exigency drivers, (e) men unfit for motor department or overseas for any reason whatsoever.

3. I am in favor of sending all Medical Department enlisted men who are intended for motor work to this camp for the preliminary training outlined above. When this has been given, the men will then be available for transfer to the base shops; for filling the proper percentage of motormen on replacement drafts overseas; for supplying motormen to motorized sanitary units and for the necessary motor service and repair work in this large camp. The decision as to the location and conduct of base repair schools and shops is conditional upon a number of factors which do not concern me, and I therefore make no recommendation except that the men for this department could well be sent through this camp prior to assignment to base shops and, further, that the base shops could well be run as an independent unit whether they are placed here or elsewhere.

4. Attention is again invited to recommendations from this office which may briefly be summarized as follows:

(a) That this command receive all men having any knowledge of motor vehicles, as soon as they have entered Camp Greenleaf.

(b) That the commanding officer of this camp be permitted to retain and instruct the men thus received for a definite period, not less than four weeks in any case.

(c) That future requests from the War Department for transfer of enlisted men show specifically the percentage of automobile field mechanics, truck drivers, ambulance drivers, and motorcycleists desired, and that this department furnish only such specified portion of said draft.

(d) That the supply department be enabled to secure its supplies in the most direct manner possible and not by requisition through tedious channels.

(e) That the estimates for expansion of this department previously forwarded be acted upon favorably.

5. This department will not be able to meet the requirements indicated by paragraph 4 of the third indorsement unless prompt consideration is given to the above recommendations and former requests for expansion. The strongest argument in my opinion for a separate establishment for the motor department is that its personnel would not be subject to indiscriminate draft as it has of necessity been in the past.

M. ASHFORD,
Lieutenant Colonel, Medical Corps, N. A.

[Seventh indorsement]

HEADQUARTERS, CAMP GREENLEAF,
Chickamauga Park, Ga., May 23, 1918.

To the SURGEON GENERAL OF THE ARMY.
 (Attention Colonel Ashburn.)

1. Returned. Attention invited to the sixth indorsement, which is concurred in, other than the examinations referred to in paragraph 2, fourth line, will be made under the general service of physical examinations for Camp Greenleaf as a whole.

2. Instructions will be given to assign to the automobile and gas-engine school, motor group, all recruits claiming any knowledge of motor vehicles, as requested in paragraph 4 (a). The request made in paragraph 4 (b) is important, but can not be carried out, unless an adequate inflow of recruits is assured this camp.

The request made in paragraph 4 (c) is reasonable, and it is requested that it be complied with as far as possible.

3. It is believed that following the assignment here for duty of an officer representing the automobile section, supply division, Surgeon General's Office, no material difficulty will occur in producing such number of trained chauffeurs and gas-engine men as the Medical Department may require, subject, of course, to assignment to this camp of a sufficient number of recruits for training.

E. L. MUNSON,

Colonel, M. C., United States Army, Commandant.

To carry out these recommendations, in the early summer of 1918 motor specialists were sent to Camp Greenleaf and every effort was made to furnish these needed drivers and mechanics.²²

The motor group, in addition to forming ambulance companies, field hospitals, and evacuation ambulance companies, all strictly motor units, formed two convalescent hospital units, and one convalescent depot. Also many hundred recruits were received and organized into replacement units of 250 men each and sent overseas as such.²²

As the summer of 1918 progressed, the work in the motor group became much more varied, and several distinct activities were carried on. The first function of the motor group was to receive, examine, and classify, as they were sent to Camp Greenleaf, all enlisted men having knowledge of motor equipment. Highly trained specialists in the repair and operation of motor equipment were placed on duty as instructors in the motor school, and from their number requisitions for men of this type were filled. Pending assignment, these men served as instructors and as specialists in the repair and upkeep of the motor equipment of the camp. Highly skilled chauffeurs were classified and utilized in the same manner as already described for mechanics. Average mechanics and chauffeurs were given special training in the motor school and upon graduation were assigned to outgoing units, according to their needs. The supply of men with some knowledge of motor equipment never fell below the requisition made.

The second function of the motor group was to operate a school for motor-men. This school was organized in January, 1918.²² In the early summer of 1918, the War Department sent three specialists (Sanitary Corps officers) to operate this school. These men were highly trained specialists in motor equipment, of whom one had been instructor in that work at the University of Michigan. Through their efforts the work of instruction was coordinated and improved, so that a very excellent motor school was operated. From this school highly trained mechanics and specialists in every phase of motor equipment were graduated. Large classes of trained chauffeurs and motor-cycle operators were also instructed. Mechanics were classified "A" and "B," "A" class being men who could do any form of base work, and "B" men who were qualified to do field repair work on the standard trucks, ambulances, and motor cycles used by the Army. Drivers were trained to operate trucks, ambulances, and motor cycles. The officers assigned to motor units were similarly trained. This school succeeded in graduating a sufficient personnel to meet requests received at camp headquarters.

The third function was to operate all motor equipment for the medical officers' training camp and to supply, in emergency, additional equipment for the line camp, which was at the same station.²² The medical officers' training camp gradually rose in numbers from a few thousand to approximately 30,000 men. The line camp gradually receded from approximately 25,000 men to approximately 10,000 men. With this increase in the troops, the motor equipment rose, so that the motor group operated approximately 50 motor cycles, 12 touring cars, 60 ambulances, and 100 trucks. In October, 1918, an inspector of the Motor Transport Corps inspected the equipment of the camp and reported that the motor equipment was in the best condition of any camp in the United States which he had visited.²² Less than 4 per cent of the equipment was in need of repair and not operating at the time of his unannounced visit. At this time only 60 per cent of the trucks of an adjacent camp were operating.

The fourth function was to send out trained motor units, such as motor ambulance companies, field hospitals, and evacuation ambulance companies.²² After the departure of the six motor companies assigned to the 7th Division, in the early summer of 1918, 20 evacuation ambulance companies, 2 ambulance companies, and 2 field hospitals were formed and sent out. A complete sanitary train was also formed and was ready for departure at the time of the signing of the armistice.²²

The fifth function was the formation of replacement units.²² This became a major function of the camp in the summer of 1918. The units were formed and sent out on an average time of five weeks after drafted men reached the camp in their civilian clothes. These men were organized into units of 250 men, with a specified number of men of each trade or calling. They were examined medically and physically, vaccinated, equipped, and given elementary military instruction. On the average, four such units were sent out from camp each month during the summer and early fall of 1918.²²

The sixth function was to receive and care for all soldiers received at Camp Greenleaf in whom hookworm was discovered. A group of about 800 of these men was maintained, so that during the spring and summer of 1918 several thousand hookworm infected men were received and cared for. The majority of these men were cured, organized into units, and sent overseas.²²

The seventh function was developed in the summer of 1918, when all venereals received in Camp Greenleaf were accepted by the motor group.²² These men were segregated, treated, and, when cured, placed in outgoing units.

The eighth function was to receive colored men and organize them into labor companies for the Medical Department, of which approximately six companies were sent overseas as replacement units of 250 men each.²²

The ninth and last function was the training of emergency officers.²² These officers were received after a few weeks training at the medical officers' training camp and were assigned to the various units of the motor group, for active experience in handling troops under field conditions. The number of officers under training at no time exceeded 200.

The motor group rose in strength, from 400 men in July, 1917, to approximately 8,000 men in the summer of 1918.²² The organization at that time was

well perfected for the training of officers, noncommissioned officers, and enlisted men; for the receipt of large bodies of drafted men and their classification, equipment, and organization into military bodies.

The following schedules graphically illustrate the instruction carried out for the different units of the group:

SCHEDULE A ²⁷

[Designed for first two weeks' instruction of recruits assigned to motor companies]

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
6 to 6.45 a. m.	This period will be devoted to setting-up exercises entire week					
8 to 9.15 a. m.	School of soldier, squad, or company	School of soldier, squad, or company	School of soldier, squad, or company	School of soldier, squad, or company	School of soldier, squad, or company	Inspection
9.30 to 10.30 a. m.	Litter drill one week and litter-ambulance drill second week, except Saturday					
10.45 to 11.45 a. m.	School of soldier, squad, and company entire week, except Saturday					
1 to 2 p. m.	Shelter tent drill	Ward hospital tent drill	Shelter tent drill	Ward, pyramidal hospital tent drill	Shelter tent drill	
2 to 3 p. m.	First aid and bandaging	Pyramidal and wall tent drill	First aid and bandaging	Ward, hospital pyramidal and wall tent drill	First aid and bandaging	
3 to 4 p. m.	Lecture	Lecture	Lecture	Lecture	Cleaning equipment	
4 to 4.15 p. m.	This period for guard mount and retreat					
4.15 to 6 p. m.	This period will be devoted to athletic games entire week, except Saturday					
6.30 to 7 p. m.	French instructions for company officers, Battalions 1 and 2, except Saturday					
7.30 to 8 p. m.	Mass singing		Mass singing			Mass singing

SCHEDULE B ²⁸

[Designed for second two weeks' instruction of recruits assigned to motor companies]

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday

^a The company lecture will be delivered upon a subject designated by battalion commander.

The noncommissioned officers' school will be conducted under direction of battalion commander. Each company commander will designate a number of attendants, not to exceed 5 men.

The officers' school will be conducted by battalion commander, who will devote one-half this period to administrative instruction and one-half to instruction in French.

^b This 2-hour period enables the battalion commanding officer to give practical field exercises under conditions simulating present war condition. The elasticity of this scheme permits and expects exercise of judgment and zeal in making this a period of the greatest usefulness. Routine drills for this period are not in accord with spirit of this field exercise. Battalion commanders are authorized to arrange with motor transportation department ambulances and trucks for this instruction.^c Athletic games are to be by voluntary participation. Battalion and company commanders are responsible that every possible measure is taken to provide means for the usual American games; to organize and encourage baseball and other teams; and to arrange schedules. The group athletic officer is concerned in the arrangements for these exercises. Parsimony is discouraged with reference to judicious expenditure of company funds for athletic games. Purchases can be made at cost through post exchange. The idea of compulsion or compulsory attendance is forbidden. Men must be encouraged but not compelled to participate.

SCHEDULE C ²⁹

[Replacement and similar units]

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
6 to 6.45 a. m.	Setting-up exercises					
8 to 9.15 a. m.	School of the soldier, squad, or company					Inspection
9.30 to 10.30 a. m.	Physical drill	Litter ambulance drill	Physical drill	Litter ambulance drill	Physical drill	
10.45 to 11.45 a. m.	Litter drill	Litter ambulance drill	Litter drill	Litter ambulance drill	Litter drill	
1 to 2 p. m.	Shelter tent drill		Pyramidal tent pitching	Shelter tent drill		Group games
2.05 to 3 p. m.	First aid and bandaging		Pyramidal tent pitching	First aid and bandaging		Group games
3 to 4 p. m.	Lecture course					Group games
4 to 4.30 p. m.	Guard mount and retreat					
4.30 to 6 p. m.	Company games: Volley ball, indoor baseball, cage ball, baseball, quoits					

SCHEDULE D ³⁰

[For reservists]

1 to 2 p. m.	Litter ambu- lance drill	Litter ambu- lance drill	Litter drill			
2 to 3 p. m.			Shelter tent drill			
3 to 4 p. m.	Lecture					
4 to 4.30 p. m.	Retreat and guard mount					
4.30 to 6 p. m.	Company games: Volley ball, indoor haseball, cage ball, baseball, quoits					

Remarks: Transport without litter will include trench work. Swimming hours will be in accordance with special division hours.

ANIMAL-DRAWN REPLACEMENT GROUP

At first all ambulance companies and field hospital companies were grouped together, but in November, 1917, the animal-drawn units were combined into what was called the animal-drawn group.¹⁹ Special training was commenced, and these units were for a short time stabilized to such a degree that by January 31, 1918, their training was estimated as 93 per cent complete.³²

On January 6, 1918, a stable company was organized on the basis of a troop of Cavalry to care for the horses and horse equipments (about 300 in number) used by the student officers.³³ These men also received instruction along the general lines for mounted sanitary soldiers. During the month of February, 1918, schools for farriers, saddlers, and horseshoers and blacksmiths were established. The abundance of clinical and other practical material contributed to the success of these schools. The purpose of these schools was to train as many men as possible to be sent outside of the camp, and to fill any of the above positions in organizations formed in the camp. In February, 1918, most of the organizations lost a large part of their trained personnel by transfer to replacement and other units.

When the group was first formed the men were quartered in that part of the camp formerly occupied by the 80th and 81st Artillery on a hill at the rear the original medical officers' training camp.³⁴ On April 29, 1918, the group was transferred to the camp recently occupied by the 11th Infantry, just back of the Dyer House, near Lytle, Ga.³⁵

The stable company of this group was disbanded on May 13, and the horses and equipment were taken over by Veterinary Company No. 1.³⁵

During April, 1918, men from the draft were received in this group and the organizations were temporarily filled to their proper quota. The demand for

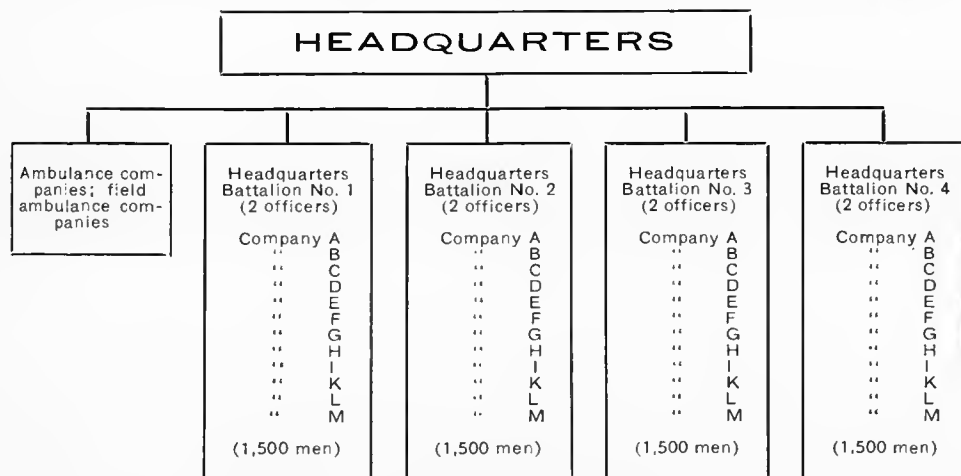

replacements was so great that this condition did not continue long, and large numbers of men were sent out during May, 1918.³⁵

In August, 1918, the animal-drawn group was again reorganized and became the replacement group.³⁶

The cooperative functioning of the detention group and the replacement group made the handling of the large number of new recruits much simpler and more efficient than previously.³⁷ The work of the replacement group was primarily the assimilation and distribution of the enlisted personnel released from the detention group, and was expanded to include their further classification into groups adapted to meet the requirements of the various sanitary units constantly in process of organization. The men, newly accepted into this section, were classified into six divisions, determined by their occupational and physical qualifications. Promising material was first selected for the Noncommissioned Officers' School; motor drivers, mechanics, and men of kindred trades were transferred to the motor group; men who had had the proper training or desired such instruction were assigned to the School for Cooks and Bakers; those experienced in clerical work, pharmacy, nursing, or similar occupations were sent to the hospital group; the remainder were divided according to their physical qualifications into general service men and domestic service men, and were held for training. This system facilitated the selection of the specially qualified men required by the various sanitary units and conserved man power by placing each man in the position where he could be of greatest value to the service.

The reorganized replacement group consisted of 4 training battalions, 2 provisional field hospitals, 2 provisional ambulance companies, 1 development battalion.³⁸

The scheme of organization can be best shown by the following diagram:³

The men in the training battalions usually came direct from Battalion No. 15, where they had spent two or three weeks after joining camp.³⁹ In some instances, however, as when more inducted men came to camp than could be accommodated in Battalion No. 15, they had to be taken right into the training battalions without any preliminary training. The men were organized

into companies and battalions, and were instructed in the duties of the soldier, school of the squad, sanitary drill, personal hygiene, and, as far as practicable, in the important Articles of War, Army Regulations, and Mason's Handbook. The length of time the men remained in the battalions varied greatly and depended directly upon the exigencies of the service. The scheme was that the men should receive never less than one month of training here and if practicable more. Not infrequently many of the men were assigned to an organization within two weeks after joining a training battalion; obviously such men were imperfectly trained.

At first, when called upon for a number of men to be sent to some other camp for overseas service, the headquarters of the group would send to each company and direct them to furnish so many men. It was found, however, that this did not allow a balanced group to go out, as the company commanders would hold good men, and sometimes one group would go out consisting, for example, mostly of stenographers, another of carpenters, etc. After this was found out the following scheme was adopted:⁴⁰ Qualification cards of all the men were carefully gone over and grouped according to their qualifications; when replacement was asked for the personnel office of the headquarters of the replacement group would go over the cards and try to pick out a balanced number of men—so many clerks, so many carpenters, so many motormen, so many men for general or other duty. Later, when base hospitals, evacuation hospitals, and other units were being formed, the tables of organization as devised by the commanding officer at Fort Riley were used, and if the group was ordered to send four or five evacuation hospitals out the personnel office used the tables for these organizations, went through the classification cards and picked the men as to their classification. Of course, it was impossible at times to furnish all classifications as called for, but as soon as this scheme was started better organizations were sent out.⁴⁰ The training of the men went on daily from 6 a. m. until 5 p. m., with lectures and entertainments in the evening. The average stay of the men in the group was about 10 days; some men stayed only 2 days, while others stayed several months. Before leaving the men were given a very rigid physical examination and a very rigid examination of the equipment that was prescribed in orders. A scheme for laying out this equipment on their cots was devised, and the equipment of several hundred men could be examined in an hour by this method.

DEVELOPMENT BATTALION

This battalion was organized in July, 1918,⁴¹ pursuant to orders received from The Adjutant General of the Army.⁴² It was placed under the command of the commanding officer of the replacement group.⁶ It was first quartered in a tent area to the west of the main camp of the replacement group, but on account of the difficulty experienced in the feeding of these more or less disabled men the battalion was moved to a small cantonment situated on a hill overlooking the replacement group.⁴³ The latter location was ideal and, though the buildings provided did not furnish sufficient quarters for the men assigned to this unit, ample shelter was obtained by the establishment of a tent area in close proximity. These tents were floored and framed. As soon as the battalion

was formed all men in the camp coming under this classification were transferred to it.⁶ The commanding officer of the battalion instituted an excellent system of classification of these men, and the records kept were very complete.⁴⁴ Men were sent to the battalion by the various medical examining boards in the camp and on arrival they were immediately classified and placed under appropriate treatment.⁴⁵ At first most of the men were venereal and orthopedic cases, but later all types of men suitable for development work were received.⁴⁶ The total number under instruction at any one time was approximately 800.⁴⁴

On account of the great variety of cases undergoing development and the close personal supervision required, the commissioned personnel on duty with the battalion was never sufficient;⁴⁷ nevertheless the work done was excellent in character.⁴⁴ In spite of the large numbers of inducted men arriving at camp the passage of the developmental case through the battalion was sufficiently rapid to keep the strength of the battalion within reasonable limits.⁴⁴ The school of urology and the school of military orthopedics handled the venereal and orthopedic cases respectively and all other cases were taken care of by the permanent medical staff of the battalion.⁴⁶

The entire personnel was divided into two sections to facilitate the proper treatment of the cases. These sections were Company A, which included all of the orthopedic cases, and Company B, in which were all of the remaining men.⁴⁴

Considerable delay in obtaining proper shoes for the orthopedic cases was experienced at first but this was obviated by the establishment of a cobbler's shop at the battalion camp.⁴⁷

DETENTION GROUP

The detention group was first an integral part of the enlisted men's section of Camp Greenleaf, but a short time after the organization of the camp a separate section known as the recruit camp was started.¹⁹ All recruits were sent to this section and a regular administrative plan was worked out to handle these men as they arrived. Each recruit, on joining, was seen personally, and his qualifications were taken. He was then carded and assigned to a company as a private, private first class, or noncommissioned officer. The companies were made up of 100 men, consisting of 4 platoons of 25 men each. Each company had an acting first sergeant and four platoon leaders, picked from recruits or from men who had been retained and trained in camp. These men acted as drillmasters and instructors in discipline and duties of the soldier.¹⁹ Each company received from 7½ to 8 hours' training daily, and the prospective noncommissioned officers devoted 3 hours to paper work and the balance of the time to drill, privates and privates first class, to first aid and drill. Recruits who joined without a full outfit of clothing were issued additional clothing as quickly as it could be obtained, to bring them up to the requirements of equipment "C." Their typhoid inoculations and smallpox vaccinations were also completed when necessary.

When the camp first started, noncommissioned officers from the militia detachment in camp were assigned as drillmasters and instructors.¹⁹ Regimental detachments were formed later, men having been picked according to qualifications after a certain amount of training. They were drilled, instructed,

and disciplined by officers assigned to this camp for training as regimental medical officers and by prospective noncommissioned officers of detachments. The prospective noncommissioned officers attended school two hours daily with the regimental medical officers.

On October 31, 1917, the recruit camp numbered 937 men, present and absent, formed into 3 battalions of 4 companies each; it was officered by commanding officer, 1 officer as assistant and supply officer, and 3 battalion commanders.¹⁹ One of these, in addition, acted as police and sanitary officer and surgeon, and one as mess officer.

Officers ordered to this camp from the medical officers' training camp for instruction in paper work, administration, and the general duties of regimental surgeons, were assigned as company officers, attending lectures with prospective noncommissioned officers, for whom they acted as quiz masters; they instructed their respective companies in first aid and drill, and were responsible for reports, returns, and discipline of their companies.¹⁹

The administrative, supply, and teaching forces, as well as kitchen and office forces, were organized and trained from reserve officers and recruits, except one officer of the Medical Corps and one sergeant first class, Medical Department.¹⁹

The name of this group was changed, later in the year, to the Noncommissioned Officers' School group.⁴⁸ In addition to receiving and training recruits this group also trained noncommissioned officers and organized such small units as sanitary squads, convalescent camps, and mobile operating units.⁴⁹

A detention camp was organized on February 14, 1918, by the direction of the director of the hospital train group, to which organization the detention camp, was added as a subsidiary organization.⁵⁰ The plan was that the detention camp should receive the incoming recruits, largely voluntarily inducted into the service, with some Veterinary Corps men and a few regular Medical Department men, and to hold them during the period of incubation of the commoner epidemic infectious diseases. It was further planned that, while in camp, they should receive the elements of military training—school of soldier and school of detachment—together with some instruction in camp and personal hygiene. The very large amount of emergency road construction required in and about camp had necessitated large drafts upon the personnel of the companies, and the training, while it progressed in a very favorable manner, fell short of that which was originally designed. The average size of each company was approximately 187 men, with an average of 2.75 officers. The normal strength of the companies as planned was 200 men, with 4 officers.

In the spring of 1918 all of the recruit work, including the handling of the draft and the detention of recruits for the specified period of two weeks, was performed in what was known as the 15th Battalion.⁵¹ The name was changed later to the detention group. The work of this group is shown more fully later, in the description of the general training of enlisted men at Camp Greenleaf. The order organizing this section of the camp and outlining its duties follows:

General Orders, No. 52.

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., June 3, 1919.

1. A detention camp will be operated hereafter as part of the Camp Greenleaf recruit brigade.

2. The detention camp will be divided into sections, one or more of which will be successively occupied for the purpose as need may require.

3. For the present, the section to be first used includes the original corrals and stables of Camp Greenleaf, the present tent camps now occupied by Battalion 15, and the barracks formerly occupied by the 81st Field Artillery.

The sections to be later used will be specified hereafter.

4. As far as possible, recruits admitted to the detention camp will be quartered in tents, in order to break them into small groups and reduce the number of direct contacts.

Every measure will be taken to keep groups in detention separate from each other, and to limit their association through messing, bathing, and latrine facilities.

5. All recruits will, on arrival, be admitted to detention camp.

6. The period of detention will be 14 days, during which time each man will be carefully inspected by a medical officer to determine the presence of any communicable disease.

No soldier will be assigned to an organization or transferred from this camp prior to the termination of the detention period.

Any recruit found to have a temperature of 101° will invariably be isolated pending further diagnosis.

7. While in the detention camp, each recruit will have a survey made in his case, by officers of the Dental Corps under instruction in the dental school, as to the condition of his teeth and the probably amount of dental work necessary.

Recruits urgently in need of dental work will be given appropriate dental treatment while in detention camp.

8. Special microscopic examination of stools will be made in the case of recruits who present any appearance of hookworm infestation and who admit of having resided in a known hookworm district.

As soon as laboratory facilities permit, the stool of every recruit coming from a known hookworm district will be microscopically examined as a routine measure.

9. To assist in carrying out the necessary physical inspections, a sufficient number of student officers will be assigned, under the school of hygiene, as aids to the commanding officer of the detention camp for the purpose of making inspections concerning, and records of, cases of communicable disease.

These inspections will be made at hours which do not conflict with instruction specified for the basic course.

10. Assignment of recruits will be made from the detention camp to organizations, units, and detachments; the commanders of which will call upon the commanding officer of the recruit brigade for the number of men needed and will specify the qualifications and number of men in each class thereof, which are desired.

11. During the detention period, recruits will receive as much instruction as practicable, but will not be subjected to severe physical exercise while undergoing reactions from inoculations against smallpox, typhoid and paratyphoid fevers.

By order of Colonel Munson:

E. S. SLEDGE,
Major, M. R. C., Adjutant.

The Noncommissioned Officers' School, as part of the 15th Battalion, was discontinued on the 1st of August.⁵³ The reconstruction company had been discontinued, and those cases that had not completed treatment were transferred to the development battalion in the animal-drawn group.

The sole work of the organization at this time was the handling of recruits from the draft.⁵³ All men joining Camp Greenleaf passed through this battal-

ion, which was known as the detention camp, as directed in the above order, where they remained for a two weeks' period, were examined under direction of the camp surgeon, Camp Greenleaf, and were vaccinated, equipped, and given elementary training in the duties of a soldier. Thirty-two companies were organized. During the summer and fall of 1917, recruits were received from recruit depots, partially clothed and equipped. These were voluntarily enlisted men, some of whom had had former military training. It was rare to receive more than 200 daily, and the maximum number during this time never exceeded 1,000 men on the morning report. The selective-service men began to arrive in March, 1918. The size of the group gradually increased, and by July it included 7,500. The largest number on any morning report was: Officers, 80; enlisted men, 7,300. The total number joining in the month of July was something over 9,000. About 3,500 were quartered in tents and about 4,000 in horse sheds.

It was originally believed, and later proved to be correct, that centralization of all paper work, official records, clothing and equipment, and mess management was essential to efficiency, owing to the lack of properly trained commissioned and enlisted personnel and to the shortage of supplies.⁵³ The organization, as adopted in the fall of 1917, and expanded as the detention group increased in numbers and requirements, included the following:⁵³ Headquarters, central record office; supply department; mess department; the surgeon; section No. 1, Companies 1 to 16; section No. 2, Companies 17 to 32.

At the headquarters office all correspondence, reports, returns, and other paper work for the command were attended to, under the direction of the commanding officer, personnel adjutant, and assistants.⁵³ Officially, the unassigned recruit was a member of Battalion No. 15, the official designation of the organization, without the company to which he was assigned being designated. The commanding officer signed all correspondence and other papers, as would a soldier's company officer. The service records, pay cards, etc., were prepared and signed by the personnel adjutant or his assistant. One consolidated morning report for the command was rendered, made up from the individual company morning reports.

Group headquarters assigned all men to companies and designated what men would be transferred out of camp.⁵³ Muster and pay rolls were prepared, one for each company, and marked "Detachment roll No. 1, No. 2, No. 3," etc. A card index, containing all necessary data in regard to pay, muster, admission to sick report or return therefrom, and availability for transfer, was kept for all men, alphabetically arranged by companies. The cards representing losses were filed alphabetically for the monthly period in which they occurred, under appropriate headings, as transferred, deserted, died, the cause of the loss being stated on the card. A second card index giving each soldier's name, company to which assigned, and other data, was arranged alphabetically for the entire command. This was found essential for the purpose of locating men at given times. Service records, pay cards, and all other records pertaining to the soldier, except the equipment record, after completion were filed alphabetically for the entire command.

SUPPLY DEPARTMENT

The group supply officer was accountable for all property in the group.⁵³ Each company commander was responsible to him for his tentage, cots, bed sacks, and other company property. The mess officer was responsible for all mess equipment used in the organization. The supply officer, after fitting the recruit, made all issues of clothing and other personal equipment, when it could be obtained. He completed the equipment records and retained them until the soldier was transferred. The company commander verified the fitting and issue of clothing and equipment to his company.

MESS DEPARTMENT

All messes in the organization were run as one.⁵³ There was one mess fund and one company fund, for which the mess officer was responsible. The ration allowance was drawn on the consolidated morning report. The mess storehouses were established, one centrally located in each section of the camp, from which the daily supplies were issued to each kitchen. The mess officer, with one commissioned assistant, did all the buying, superintended the issues, was responsible, as stated above, for all mess equipment used, and was responsible for the preparation and serving of all meals. Each company had its own mess hall and kitchen, many of which were temporary, using field ranges. Three cooks were assigned to each kitchen, with a mess sergeant to every three messes, all directly under the mess officer.

The company commander detailed all necessary kitchen police and inspected the mess daily.⁵³ The mess officer was responsible for the police in the kitchen and mess hall. Food waste was stopped by placing one of the kitchen police on guard over the garbage can, allowing nothing to be thrown away that was edible. Mess kits, after being washed by the soldier in hot soapsuds, were dipped into boiling water and were thus sterilized and dried. Three camp kettles of boiling water, kept boiling during the meal hour, were located at each kitchen. Burned-out boiling plates from discarded field ranges were reinforced with strips cut from old steel escort-wagon tires and set up with a Sibley stove at one end. A fire was kindled underneath and three camp kettles kept boiling on the top. The same menu was served in each of the 33 messes daily.

THE SURGEON

The company officers were medical officers. Every recruit was daily inspected for infectious diseases during his first two weeks in camp, by one of his company officers.⁵³ All suspects were sent at once to the surgeon. When a case of infectious disease occurred, the patient was transferred to General Hospital No. 14. The contacts, those quartered in the tent with him, were removed, bag and baggage, to another tent in a section of the camp set aside for isolation, and were held there during the incubation period of the disease. While in isolation the soldier continued his training and was under the direct supervision of the surgeon. A hookworm survey was made on all men arriving from that part of the country where the disease was known to be endemic, necessary specimens being collected under the supervision of the surgeon and sent to the general hospital laboratory. All venereal cases arriving, or devel-

oping later, were assigned to one company and treated under the surgeon's direction. Only very acute or complicated cases were transferred to the hospital. The surgeon completed the smallpox, typhoid, and paratyphoid vaccinations, the companies being marched to the infirmary at the appointed time. He completed and filed all vaccination records, reporting the results, as completed, to the headquarters office for entry on service records. He held sick call for the command and prepared the sick and wounded and sanitary reports and rendered daily to the headquarters office the surgeon's consolidated morning report of sick. The company officers made the semimonthly physical inspections of their individual companies.

COMPANY ORGANIZATION

The companies were grouped into two sections, with an officer designated as the tactical director in charge of each, acting as would a battalion commander. The tactical director represented the commanding officer and was directly responsible to him for all the training, discipline, sanitation, and police of the companies in his section. He kept no office of record.

COMPANY ADMINISTRATION

The strength of the companies varied from day to day.⁵³ The maximum strength, depending upon the housing capacity, ranged from 200 to 250 men. The officers were assigned from the medical officers' training group, and unfortunately were frequently changed and lacked training as company commanders. Two officers, when available, were assigned to each company. The company was divided into platoons of 50 men each, with a platoon leader belonging to the permanent training cadre assigned to each platoon. One platoon leader acted as first sergeant of the company. The company commander kept a morning report and roster of his company. No other paper work was done in the company. The brunt of the training of the recruit fell upon the platoon leader. These men were given warrants and promoted as rapidly as they showed their ability to train others. None was promoted to fill vacancies. Promotion was given only for proved merit; demotion, therefore, was very rare.

The following was the routine devised and carried out on the arrival of men for training.⁵³

Prior to arrival, lists were received showing date of expected arrival of trains, with routing, and number of men from each local draft board traveling on each train. The assignment of men to companies was so made as to keep each local board's group intact, so far as possible. The companies receiving men were depleted of all men except the training cadre. Tentage, cots, and bedding were made ready for occupancy the day prior to the arrival of new men.

The train was met by the tactical director of the section and by the company officers and noncommissioned officers of the companies to which the men had been assigned. The men were detrained, and the recruit from each local board designated as captain was directed to collect the men of his local board. The men as assigned to a company were lined up in column of fours, counted and marched past an empty truck, in which they placed their baggage. The company and truck then proceeded to camp. In this manner all men were

formed into companies, counted, and the number of men received from each local board verified. One truck was used for each company.

The company was marched in single file by the supply house on its way into camp. Each man was given a bundle which had been previously prepared, containing one mess kit complete, toilet articles, slicker, and blankets. In front of headquarters another check was made, and the induction papers, sent from each local board with the recruit designated as captain, were taken along, with any report the captain had to make. The company fell out, each man securing his baggage from the pile belonging to his company, fell in again, and marched to its company street. The men were then taken to their mess hall, to find a hot meal awaiting them regardless of the time of arrival. The company was later reformed, alphabetically, by local boards, at the headquarters office. The recruit's name was verified, compared with its spelling on the induction papers, and lists prepared for each local board group, showing the date of induction, date of joining, and the company to which assigned. Three copies of lists were sent with the induction papers to the physical examining office; one to the company commander for his official roster; one to the supply officer, who at once prepared the individual equipment records; one to the surgeon, for preparation of vaccination records; one to the post office; one retained, from which the index cards were begun. These cards were completed on receipt of the service record following the physical examination of the recruit.

Each recruit was then tagged. On one side of the tag a verse was printed telling what was expected of him as a soldier, the other gave his company number and post-office address. An hour's talk of welcome and general instructions was then given the company by the chaplain and company commander. The company was marched to one of the Young Men's Christian Association buildings, each man furnished with writing material and encouraged to write a letter home. A mimeographed letter prepared by the morale officer and signed by the commanding officer was inclosed, assuring the family of his safe arrival and asking their support.

The company was bathed and that afternoon or the following morning reported for physical examination. The men examined and rejected during the morning were discharged from the draft that same afternoon and sent to the quartermaster for pay and transportation home. Those rejected in the afternoon were discharged the following morning. The men accepted in the morning were clothed and equipped in the afternoon by the supply officer. Those accepted in the afternoon were clothed the following morning. All civilian clothing, handbags, and grips were then packed, tagged, and shipped home by express for the recruit, or otherwise disposed of by him. He was allowed to retain nothing except his uniform clothing and equipment. He now ceased to be a civilian and his military life commenced.

All men were required to keep their hair cut shorter than 2 inches. Hair clippers were furnished each company and practically every man in the company received a free hair cut the afternoon he donned his uniform. The recruit was then ready to begin his training.

Until the replacement group at Camp Greenleaf was organized, to which the recruit was transferred after his quarantine period, to continue his training and be classified and assigned according to his qualifications, men were transferred directly to various medical detachments throughout the country and to overseas replacement units. The recruits longest in camp were transferred first, an attempt being made to transfer whole companies as far as practicable, except the sick and those held for one reason or another. Lists were prepared at the group headquarters office, designating, by companies, the names of men, date, and hour of departure. This office received the individual equipment records from the supply office, the vaccination cards from the surgeon, completed indorsements on service records, pay cards etc., and had, at the time of transfer, all papers ready to be forwarded with the men. The company commanders assembled and reported to headquarters all men ordered transferred. Each man had his personal effects in his barrack bag and the bag was tagged, giving his name and destination. No other baggage was transported. If the men were traveling by train, each was issued a muslin bag in which to carry his mess equipment for use en route. These bags were purchased in lots of 5,000, out of the company fund, having been made up by civilian firms.

As each recruit's name was called from the final transfer roster, he deposited his barrack bag in a waiting truck and fell in line beyond. When all had thus been checked, the detachment moved off. Thus, by standardizing and systematizing the receiving and transfer of recruits, 2,000 men daily could be handled without confusion or error, the whole work being performed in a machinelike manner.

EVACUATION HOSPITAL GROUP

In 1917, the evacuation hospitals and hospital trains were formed in what was known as Battalion No. 14, which designation was later changed to the hospital group.²⁰ Evacuation Hospital No. 3 was the first to be organized. All the personnel, except the commanding officer, was selected by the camp commander and assigned to this unit. Not only was the hospital organized completely, but after organization its personnel was used to conduct a subsidiary course, so as to relieve the regular instruction companies of some of the special instruction. A class of 20 officers was assigned to duty with the evacuation hospital to take the course in the duties of a regimental surgeon. This course lasted about two weeks and covered administrative duties of regimental surgeons and assistant regimental surgeons. The work in the above class was so arranged that the student officers attended lectures and quizzes of the basic course at the medical officers' training camp.

School for enlisted men, privates first class, and privates, Evacuation Hospital No. 3, consisted of daily lectures by officers of the evacuation hospital, on duties of soldiers, Medical Department.¹⁹ These lectures were followed by a quiz, conducted by squad leaders. In addition to this, the enlisted men were divided into groups of from 12 to 15 men each, and one officer-instructor was assigned to each group. The work outlined in Mason's Handbook was completely covered in detail by lecture and quiz by these officer-instructors, and special work peculiar to evacuation hospitals was given. All enlisted men of

this command were required to take this course; approximately 90 privates first class and privates completed the course of instruction and were sent out as regimental detachments. About 12 of such detachments were formed, using these men as the nucleus for the enlisted personnel.

Later, Evacuation Hospitals Nos. 4, 5, 6, and 8 were organized, but these units had the entire officer personnel assigned to them by orders from Washington.²⁰ The officers of these units received thorough general instruction, and a number of the enlisted men received instruction at the post hospital in addition to the regular military training given at camp.⁵⁴

During the early part of 1918, the demand for the rapid organization of base and evacuation hospitals was so pressing and the shortage of men was so acute that the commandant wrote the following letter:⁵⁵

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., April 8, 1918.

From: The Commandant.

To: The Surgeon General of the Army, Washington, D. C.

(Attention Colonel Munson).

Subject: Base and evacuation hospitals.

These base and evacuation hospitals are being organized as rapidly as time and personnel will permit. However, at the present time there are about 1,200 men available for this purpose; these are only available because they have been held intact for this purpose; the result being a shortage of about 800 men to fill assignments in other camps, with new orders coming in daily.

2. It is obvious that this camp can not meet the demands for organization and replacement troops and send detachments to the various home stations, when there is a present shortage here of something over 6,000 men.

3. The rapidity with which the last draft quota is being ordered from this camp (especially calls for N. C. O.'s), the correspondence from different divisions as to forming new units, the reservations by the specialists in the Surgeon General's Office, and the demands for officers for general service show an apparent lack of coordination between the officers directing the income and outgo of this camp in the matter of personnel which results in demands that are manifestly impossible under the present allowance as to time and men.

4. Attention is also invited to the fact that a considerable number of the drafted men are afflicted with venereal disease, hernia, and other disabilities that are acceptable under existing selective service regulations, but are not available for transfer according to instructions from The Adjutant General. This fact is causing an increasing number of temporary ineligible.

Definite figures on this matter are being compiled.

H. P. BIRMINGHAM, *Colonel, Retired.*

[First indorsement]

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
April 15, 1918.

To the COMMANDANT, M. O. T. C.,

Camp Greenleaf, Fort Oglethorpe, Ga.

1. Returned, inviting attention to confidential letter from this office of April 11, and memorandum to Colonel Munson of April 13.

2. It is desired that, in the absence of sufficient enlisted men to complete the units authorized, at least the skeleton organization be found.

3. It is the intention to request assignment of Sanitary Corps and quartermaster officers to base and evacuation hospitals as soon as they are authorized.

By direction of the Surgeon General:

W. L. HART,
Lieutenant Colonel, Medical Corps.

During this time a number of hospital trains were organized and received training. This training was mostly general in character, for at that time there were no regular hospital trains at camp on which special instruction could be given.⁵⁶

In June, 1918, the shortage of enlisted men at the camp was still so acute as to call forth the following letter and reply thereto.⁵⁷

JUNE 3, 1918.

From: The Commandant.

To: Col. P. M. Ashburn, Surgeon General's Office, Washington, D. C.

Subject: Base and evacuation hospitals.

1. Referring to the following memorandum just received:

1. The overseas section desires that all base and evacuation hospitals now in your camp, that are ordered to other camps or posts, be sent without delay and that the enlisted strength of each be brought up to at least 50 men.

It is required that the same requirements apply to units to be ordered away in the future, unless the orders be for overseas service, when they should be filled to capacity.

2. I have already written you regarding the situation as to base and evacuation hospitals here. We can, of course, take 50 men from the recruits just arrived and not yet in uniform and send them away to the other camps and posts to which they are ordered. They will have no training in basic work, will probably be put directly in the hospitals for training and ward work, and it seems to me the results would not be satisfactory to the hospital division.

3. As I have already written you, these organizations would have long since been created and long since sent away, if the enlisted personnel for them had been provided. The best way out of an unsatisfactory situation would seem to me to have these outfits stay here six weeks and let us fill them up so that they will go away, not with 50 men, but with their full quota, and drilled and disciplined into some semblance of soldiers. We can do this, provided we are not called upon to meet small calls for the United States, which in the aggregate make heavy drains.

As I wrote you the other day, none of the base or evacuation hospitals which are ordered to other camps and posts, outside the ones that are held complete and intact, and which are already trained, other than Base Hospital No. 47, which is recruiting up, can be filled up with men with more than a week's service. It would seem to me very unsatisfactory to send them out under such conditions. I believe their training here for six weeks should be considered as indispensable.

Will you please take the matter up with the hospital division and let me know what their decision is in the matter.

E. L. MUNSON,

Colonel, M. C., United States Army.

JUNE 8, 1918.

From: Col. P. M. Ashburn, M. C.

To: Commandant, M. O. T. C., Camp Greenleaf, Fort Oglethorpe, Ga.

Subject: Base and evacuation hospitals.

1. Referring to your letter of June 3, on the above subject, I have tried to obtain a conference in regard to it with General Noble, but thus far unsuccessfully. I therefore referred the letter to the hospital division for comment, and it is to-day back with the following memorandum signed by Lieutenant Colonel Hart.

JUNE 7, 1918.

Memorandum for Colonel Ashburn:

With reference to attached letter, we desire that the units which have been or may hereafter be ordered organized in medical officers' training camps, and which are ordered without delay, and that the enlisted strength of each be brought up to at least 50 men. The nearer the unit can be brought up to its normal enlisted strength the better, but the compliance with the order should not be delayed to this end: At least 50 men should be assigned to the organization under any condition.

This does not apply to those ordered from camp for overseas service, in which event the unit should be brought up to its full capacity.

W. L. HART,

Lieutenant Colonel, Medical Corps.

One inclosure.

* * * * *

3. In further conversation, Lieutenant Colonel Hart tells me that the units now ordered away and to go over in the third phase, should have gone to various camps on April 16, and that they must now get hospital training whether they have any other or not.

* * * * * *

By direction of the Surgeon General:

P. M. ASHBURN, *Colonel, Medical Corps.*

During July, 1918, the organization of evacuation hospitals became exclusively a part of the general program of Camp Greenleaf.⁵⁸ The plan contemplated producing, by intensive drill and instruction in various professional and special schools, a more or less adequate supply of standardized commissioned and noncommissioned personnel for use in making up standard units in the shortest possible time. In accordance with this plan, a group was created for the organization of evacuation hospitals. This was known as the evacuation hospital group. Its personnel was composed entirely of temporary officers and men. Its administrative machinery consisted of a headquarters, a headquarters company, and 12 hospital cadres. The headquarters officers and personnel were about such as would obtain in a regimental organization. The hospital cadres were about such as would obtain in the cadre-company organizations of a recruit depot—that is, 3 commissioned and 24 to 36 non-commissioned officers each. Their functions, likewise, were analogous to those of recruit depot companies. These cadre men were especially selected for their aptitude and qualifications in company administration, clerical work, property handling, mess management, drilling, and instructing.

The organization of a given hospital was initiated by the assignment of a contingent of recruits to a hospital cadre. The drill and instruction scheduled and carried out were designed with the chief aim of producing hospital commands of men of high grade, physical fitness, discipline, and morale.⁵⁹ By repeated physical and mental surveys, the unfit were discovered and eliminated, the fit reclassified and improved. Instruction in the duties of a soldier was given by members of the hospital cadres—by precept, lecture talks, and demonstrations.

Instruction in hospital administration, including all paper work, and in nursing and ward management was given by cadre officers and men and by chiefs of hospital services in lecture talks and demonstrations. Drill methods of both Infantry and Medical Department were used, Infantry foot drill being used for the greater portion of the time. The importance of drill in achieving discipline was emphasized, and the routine schedule was made as elaborate and thorough as possible. Fully one-half of each duty day was profitably taken up with drill formations, interspersed with short periods of instruction. For the purpose of promoting efficiency in administration and the handling of men, the camp command was organized after the manner of a regiment—into battalions—and hospital officers were rotated in the offices of company, battalion, and regimental commanders.⁵⁸

The outstanding importance of morale was emphasized, and morale was promoted by a judicious mixing of work and recreation; by a headquarters morale office; by a somewhat extravagant outlay for outdoor entertainments—theatrical, athletic, and social; and by a constantly preached, practiced, and enforced policy of unit independence, originality, and self-sufficiency. The group's motto was "Like your job." ⁵⁸

Technical training at the camp was not undertaken except as above mentioned—through lectures and elementary demonstrations—but the practice of sending completed hospital units to base, camp, or general hospitals, where they were temporarily attached for duty prior to departure for overseas, served the purpose.

The actual time consumed in organizing standard evacuation hospital units was about two months; that is, the camp could, and did, produce 12 evacuation hospital organizations every two months; or, from July, 1918, to November, 1918, it produced Hospitals No. 25 to No. 49, inclusive.⁵⁸ In forming so many units of this character it was considered of great importance that the instruction should be standardized so as to be able to give as much instruction as possible in a short time. To accomplish this the following group order was issued:⁵⁹

General Orders, No. 1.

HEADQUARTERS EVACUATION HOSPITAL GROUP,
Camp Greenleaf, Ga., July 24, 1918.

* * * * * *

1. The evacuation hospitals and hospital trains in this camp constitute the units of this group. The staff of the commanding officer will consist of an adjutant, a personnel adjutant, a supply officer, a mess officer, and a sanitary inspector. There will be a headquarters company. The adjutant, the personnel officer, and the commanding officer, headquarters company, have been designated. The evacuation hospitals will constitute a section and the hospital trains another, each with a field officer or the senior officer on duty therewith as section commander.

2. In view of the limited periods of time that members, both commissioned and enlisted, of any units have or in all probability will remain on duty here, it will be the policy of this command, in so far as practicable, to aim at standardization in all matters pertaining to administration, drill, and instruction.

3. *Standardization of drill methods.*—In order that drill methods in practice among various units may be further perfected and standardized, one drill period daily will be taken up by section commanders in drilling the officers of their units. The period selected will be that now given over to physical drill, and the drill subject or movements for each day will be those to be carried out later on the same day at company drill. The efficiency of unit drill methods will be perfected by drill and instruction of drillmasters, subalterns, and N. C. O's., to be given in the case of each organization by the unit commander.

4. *Standardization of instruction.*—What has just been said relative to drill methods will apply in the case of instruction methods. It is desired that schedules, (1) for officers, (2) for men, be made for use throughout and be based upon a study of what is considered most essential that can be covered in the limited period of time, that is, three weeks. In preparing these schedules, it will be necessary to take into consideration not only the limited time available, but the fact that all the members are raw and inexperienced, and that the prime purpose of their training is to fit them for service in the units to which they belong.

5. *Standardization of administrative methods.*—It is desired that section commanders make a study of company administration so that uniform methods may be in practice in company offices (records, messes, property handling, police, care of barracks, grounds, etc.). Orders will be issued shortly prescribing the method to be followed in organizing units.

6. The sanitary inspector will submit a study recommending methods to be followed in physical and sanitary instruction and other hygiene measures.

By order of Colonel Rutherford:

W. W. HOYT, *Captain, M. R. C., Adjutant.*

The instruction for the officers and men of this group was outlined in specially prepared schedules, as follows: ^{60 61}

By order of Colonel Rutherford:

W. W. HOYT, *Captain, M. R. C., Adjutant.*

The following evacuation hospitals were organized at Camp Greenleaf: Nos. 3, 4, 5, 6, 8, 13, 14, 22, 23, 24, 25, 26, 27, 28, 30, 31, 32, 33, 34, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53.²¹

Evacuation Hospitals No. 25 to No. 53, inclusive, were organized in the specially constituted evacuation hospital group.⁵⁸

NONCOMMISSIONED OFFICERS' GROUP

When the camp was first organized each small unit or group trained its own noncommissioned officers.¹⁹ These small schools existed in Battalion No. 14 (hospital group), Battalion No. 15 (recruit camp), field hospital group, and ambulance company group.⁵⁴

The course of instruction in these small schools averaged seven weeks, and the output was sufficient for the needs of the then small camp.

As the camp became larger a distinct noncommissioned officers' school was organized in Battalion No. 15 and a small group, known as the noncommissioned officers' school group, was formed. In this group was not only the noncommissioned officers' school, but the sanitary squads, convalescent camps, convalescent depots, mobile operating units, and cooks' school.⁶²

The curriculum for the noncommissioned officers' school was arranged to cover as completely as possible the military duties of noncommissioned officers of the Medical Department, requirements of paper work necessary in all sanitary detachments, and the handling of men; the object being to have on hand and to supply on demand well-trained personnel ready for promotion to corporals and sergeants.⁶³ It had been worked out so that any number of officers might be sent to this school and trained for the specific duties of various units, such as convalescent camps, their training being in part separate from and in part conjointly with the men who were to become their enlisted personnel.

After such units had been designated to be trained here and their enlisted men selected, they were advanced to this specific training, the remaining men attending the regular school duties until they were designated for special organizations.

The regular curriculum of the school consisted of 24 hours per week of didactic lectures on paper work, selected portions of Army Regulations and the Manual for the Medical Department, and the solution of practical problems; 7 hours per week on Mason's Handbook and Sanitation, and several hours' instruction each day in the school of the soldier, platoon, and detachment, litter and shelter-tent drill.⁶³

At that time, even though a special school was organized, each of the larger groups continued to have schools for noncommissioned officers.³⁶

The regular noncommissioned officers' school continued steadily under this plan up to late spring of 1918, as is shown by the May report of the school: ⁶⁴

On May 1, the total strength, enlisted personnel, of this command was 206. Seventy-five of this number, including 21 sergeants, 24 corporals, and 16 cooks, as the headquarters detachment of this command, were the permanent detail for the internal administration of all the units of Battalion 15. The balance (131) were enrolled in the school proper.

The regular course of didactic lectures, practical work on papers, and drills was carried out, and during the month 67 of these 131 men qualified for promotion, warrants being given to 52 as sergeants and 15 as corporals.

At the end of this school period there remained 64 men, about half of whom would have qualified for warrants after about a week's further instruction. These men were sent out to fill orders as having the qualifications for prospective noncommissioned officers. About 30 of the 64 men who were not recommended for warrants were sent out to fill orders as privates, they having shown no qualifications to support the belief that they would at any time rise above their present status.

During the month there was concluded a two weeks' special course on venereal prophylaxis, to a few selected men from this school. These men are now being held to fill orders in furtherance of this work. That is, to go out among different camps as missionaries in the prevention of venereal diseases.

At the end of the month the headquarters detachment for the administration of the units of Battalion 15 was intact. The enlisted personnel of the school proper consisted of 6 privates and 1 sergeant.

A special noncommissioned officers' group was formed in July, 1918.⁶⁵ The personnel was at first recruited from the better elements of the various groups of the camp. After these early days, however, the men were selected upon their arrival at the replacement group after an initial two weeks training in the detention group. Thus it will be noted that noncommissioned officers were created from absolutely green material, with a very short period of instruction. All candidates before being sent to the noncommissioned officers' group were passed upon by a board of officers who considered the following qualifications: Education, practical training, recommendation of immediate commander, personality, and psychological rating. Candidates were received in groups, several hundred in number, at intervals of approximately two weeks. The school grouped each draft into a battalion, composed of 4 companies and numbering about 400 men. The entire school consisted of 3 battalions, as a rule, of approximately 1,200 men. The number grew steadily with the increase in size of the camp, and had not the armistice cut short this work, this school would soon have enrolled 3,000 picked young men.

The course was of six weeks' duration.⁶⁵ The first day was consumed in facilitating the adjustment of the candidates to their new surroundings, and in the selection of acting noncommissioned officers from among their number to fill the majority of the company details. Each company was commanded by a commissioned officer, who was assisted by a first sergeant and a duty sergeant of the permanent cadre of the noncommissioned officers' group. Companies were made as nearly self-supporting as possible from the first day. The men in training got out all the required daily, special, and routine reports, thus familiarizing themselves with the ordinary company reports. They formed the platoons, assembled the company, and acted as squad leaders. They were detailed in turn as acting mess sergeants. Details were changed by roster, so that before graduation each man had served through all the company grades.⁶⁵ Individual performance was closely scrutinized and daily rating kept by the company commander so that most company commanders by the time of the conclusion of the course were able to appraise their men very justly. Each day opened with first call, at 5.20 a. m., and formally closed with retreat at 4.30 p. m. It was very rare that men were granted or requested a pass. Occasional exceptions were made to this rule when an entire battalion or the entire command were given passes as a reward for unusually good general showing. Special classes were frequently held in the evening.

Efforts were centered on making direct appeals to the individual.⁶⁵ Each man wore his name in large print on a white muslin strip over the pocket on the left side of his shirt, as was done in some of the officers' training camps. Each man knew he was being watched, not only by his company commander and other commissioned officers, but by noncommissioned officers, and by those of more concern to him than all others, his comrades. A typical cadet spirit was soon developed. The companies were formed at reveille and kept at work all day. They first completed a brisk general police of camp, then policed their tents, and attended to personal hygiene. The companies were next formed and double-timed to breakfast, one-quarter mile. This formation was repeated on return from breakfast in order to bring the men together with a snap early in the day. A short respite was then allowed. The companies were double-timed to drill field at 7.30 a. m. At the conclusion of drill at 9 a. m. they were returned in the same way, except that intervals were scheduled between battalions in order that all men could be given time to bathe. This saved time, freshened the men after the morning's physical stress, and put them in a receptive mood for class work, which followed immediately thereafter, in two 50-minute periods. The afternoon afforded two more 50-minute periods for class work, and at 3.30 the battalions were again on their way to the drill field, where they remained until 4.30 p. m. Twice weekly during this hour the entire command was formally paraded. Class work was made as practical as possible, much time being given to interrogation and preparation of forms, which, when handed in, were corrected and returned.

During the month of October, 1917, a change in the system of obtaining instructors for the school was inaugurated.⁶⁶ The basis of the entire scheme was practical instruction, to be carried on in groups of not more than 10 men, preferably 5. In order to carry this out, it was necessary to obtain a large force of men who were competent to teach. Medical officers in such numbers were not available. It was then decided to use the graduates of the school for adjutants, registrars, and mess officers for this purpose.⁶⁶

The school for adjutants, registrars, and mess officers, which was a part of the noncommissioned officers' group, trained men for commissions in the Sanitary Corps.⁶⁶ Its course consisted of two parts—first, four weeks of didactic teaching entirely similar to the course in this school; second, at the end of that time those who had qualified were given a subsequent course of practical instruction of at least four weeks. If then it was found that suitable progress had been made, these men appeared before a special board for examination for commission in the Sanitary Corps.

The majority of the men coming from that school were of the grade of sergeant, or higher.⁶⁶ It was thought that this practical instruction could be given these men in necessary paper work, handling of men, mess management, etc. To this end, these men were assigned as cadet officers to the various companies of the school. In this manner they handled the companies as actual commanding officers, getting practical instruction in organization, the handling of men, all the necessary paper work, and mess management, and at the same time they were used as instructors in the various branches taught in the school. Two purposes were thus accomplished—first, the candidates for commission

received the practical instruction required, and, second, the knowledge these men possessed along special lines was made of use. By using these men, the instruction was divided into small groups with far better results. The amount of work done in the group can be seen by the following table of results covering the period from the inception of the group, July 29, 1918, to October 31, 1918:⁶⁷

	Losses	Per cent
Assigned and joined.....	1,812	
Transferred (recommended for warrants).....	817	62.9
Transferred (not recommended for warrants).....	465	35.89
Died of disease.....	10	.77
Discharged.....	6	.46

Remaining.....	514	
Total.....	1,812	

MORALE DEPARTMENT

On March 2, 1918, a memorandum was submitted to the Surgeon General by the commandant, Camp Greenleaf, outlining rather definite methods for the establishment and maintenance of soldier morale.⁶⁸ In May the commandant made practical application, in the camp, of the proposed plan. On June 6 a camp morale officer was appointed, with duties as outlined.⁶⁹

General Orders, No. 57.

HEADQUARTERS CAMP GREENLEAF, *Chickamauga Park, Ga., June 6, 1918.*

1. The position of morale officer for Camp Greenleaf is hereby created.
2. The duties of the morale officer relate to the psychological uplift of recruits and the early development of a wholesale mental attitude by them toward service in the Army and in the Medical Department. They are especially intended to make the introduction of the recruit into the service as pleasant and instructive an experience as is practicable with due consideration for military requirements.
3. The morale officer will take measures for the provision and operation throughout the camp of an effective organization for the early information of recruits in respect to their personal relation to the military service; the sympathetic understanding of their personal difficulties and of advising therein; the stimulation of patriotism, and inculcation of loyalty to superiors; the allaying of suspicion toward, or opposition against, the military service; the provision of suitable recreation and education; the fostering of ideals of equity and sportsmanship; and the promotion of the spirit of service.
4. To this end he will coordinate and systematize all existing agencies and methods calculated to facilitate the adjustment of the recruit to the military environment, and take such additional measures, not interfering with military duties, as may seem desirable for the purpose.
5. The morale officer will have such representatives and assistants, throughout the various sections and organizations of Camp Greenleaf, as may be necessary.
6. Full advantage will be taken of the services in this respect of the chaplains on duty at Camp Greenleaf.

The personnel and facilities of the Young Men's Christian Association, Knights of Columbus, Jewish Board of Welfare Workers, and committee on training camp activities will be utilized to the full extent offered for the purpose by those organizations.

By order of Colonel Munson:

W. S. SLEDGE, *Major, M. R. C., Adjutant.*

On June 13, in response to a request from the commandant, a memorandum was submitted to him by the department of military psychology, suggesting a detailed program for improving the morale of recruits. These suggestions were criticized and returned, and a revised program was submitted by the newly appointed morale officer.⁷⁰

The revised plan as approved and returned to the camp morale officer was put into effect in the 15th Battalion, detention camp, Camp Greenleaf, on June 20.⁷¹ A large tent was erected opposite battalion headquarters, near the Young Men's Christian Association Building, and central with respect to the arrival and departure of troops. The assistant morale officer, with a detachment of 35 enlisted men from the school of military psychology, was detailed to initiate this work. The purpose of the commandant was so to standardize a method in this battalion that it could be made applicable to other sections of this camp, and also be offered to the General Staff as a tested program for the institution of similar organizations in other camps throughout the country.⁷⁰

The personnel for this work was distributed as follows:⁷¹

In each detention camp (2,000 to 5,000 men):

One morale officer.—In general charge of work in camp. In particular, confers with Young Men's Christian Association and other workers, chaplains, and morale soldiers each day, to arrange program in detail for following day. Program distributed to companies for posting on company bulletin boards. Receives from each morale soldier a formal report of activities during previous 24 hours. Makes daily consolidated report to morale officer, with copies to each company commander and to each section commander.

One chaplain and assistant.—General oversight of religious instruction, instruction in English branches, formal inspirational talks, and mail, for the first three of which he is responsible with respect to program followed. Talks to men upon arrival and departure.

One civilian worker.—Cooperates with chaplain on religious instruction and formal talks.

One civilian worker.—Cooperates with chaplain in English instruction. Furnishes instructors, arranges program of intensive detail. Instructs at least one hour per day.

One civilian worker.—Arranges with company athletic officer with regard to athletics and games. Arranges program within each company during week, and between companies Saturday and Sunday.

One civilian worker.—In charge of entertainments; responsible for entertainments to be held every night.

Two civilian workers.—Assists in above, and in singing.

One training camp activities officer.—In charge of group singing. Responsible for group singing in camp two nights per week. General oversight of singing in smaller groups.

Two morale soldiers.—In charge of information booth.

One morale soldier for each company.—To act as sick sergeant. Leads in company group singing on all possible occasions. Assists in drill. Gets into touch close with men. Makes formal daily report to morale officer, especially with regards to suggestions for the improvement of morale in the company. Responsible for letter home. Either assists in athletics or aids as instructor in English.

Approximately seven weeks later it was believed by the commandant that the system already instituted in the 15th Battalion had become sufficiently standardized to permit of its extension to other sections of the camp. This extension was accordingly ordered and effected, as outlined below:⁷⁰

INTENSIVE MORALE PROGRAM AS APPLIED TO RECRUITS

The morale work is broadly divided into an intensive and extensive phase. The intensive phase is concerned primarily with the stimulation of the morale of the recruit from the time he detains until he leaves the detention camp—a period normally of two weeks. The extensive phase of the work concerns itself not only with the recruit during his stay in the detention camp, but equally to the later developmental periods of his training.

A. *Detrainment*.—The troop trains are met by officers and noncommissioned officers, the latter including one noncommissioned officer especially detailed for morale duty with each company, who assemble the men by local boards and march them to the detention camp. They are encouraged to sing and cheer on the march.

B. *Upon arrival at camp* the men are assigned to companies and taken to the company streets, where the morale sergeant assists them in their primary adjustments. They are shown how to make their beds, instructed in the use of mess kits and the saving of water, and are informed as to the location of company mess halls, latrines, and wash houses. They are given an unusually good first mess and a bath. Instruction is attempted by friendly counsel rather than by the depressing method of trial and error.

C. *Primary morale system*.—(1) Upon the morning of the recruits' first full day in camp they are rostered by companies, after which they are turned over to the morale sergeant of their company and marched to the information tent, which serves as the headquarters of morale work in the detention camp. Here they are given a tag, bearing on one side the following paragraph:

You are now a Soldier of the United States; a Soldier Selected by your Country to fight for the Freedom of the World.

WALK like a soldier

THINK like a soldier

ACT like a soldier

BE A SOLDIER!

This is not easy to do at first and there may be things that you do not understand. Never mind; all good soldiers have learned to do the same things that you are learning to do. Remember you follow a flag that has never led in an unjust war. Remember that the American Army has never yet been defeated. Do your part now and it never can be. Keep your head up, your eyes open, and smile!

On the reverse side of this tag is stamped the recruits' new company and camp address, with a blank space for autograph, which is written in at this time, and the tag is then firmly attached to the clothing. This tag serves, during the first few days, the double purpose of identification and inspiration.

(2) The recruits are now marched in company formation, still under the direction of the morale sergeant, to some open-air amphitheater, or to an auditorium if the weather be inclement, where they each receive a copy of the pamphlet *Keeping Fit to Fight*, issued by the social hygiene division of the Commission on Training Camp Activities, and given an informational talk by the morale officer or his representative. This talk, which is, of course, informal, nevertheless attempts to cover briefly the following points:

I. Nature of detention camp.

1. Boundaries.
2. Relation to permanent organization.
3. Reasons for detention—
 - (a) Assurance against introduction of contagious diseases.
 - (b) Preventives—
 - Vaccination.
 - Inoculation.
 - Hookworm.

II. Venereal Diseases and related Army Regulations.

III. Entertainments and athletics:

1. Programs for detention camp.
2. Entertainers report for entertainment duty.
3. Daily detailed athletic period.
4. American Library Association—library privileges.

IV. Informational system:

1. Tent and headquarters.
2. "Sick sergeant"—company information bureau.

V. Letter-writing:

1. Detailed opportunity.
2. Inclosure (form letter signed by battalion commander).

VI. Clothing—reasonable attitude toward fit.

VII. Food—wholesome not dainty.

VIII. Military qualities of a soldier—discipline.

IX. General qualities of a soldier—manliness, cheerfulness, indifference to hardship, etc.

(3) The recruits are then taught a lively Army song by a morale song leader, and are given a brief inspirational talk by the chaplain or his representative, covering such important points as:

- (a) Words of welcome and encouragement.
- (b) Character of Army discipline and necessity for absolute obedience.
- (c) Friendly attitude of officers.
- (d) Aims of the war.
- (e) Character of the enemy.
- (f) Moral problems of the soldier.
- (g) Danger of giving way to homesickness.
- (h) Seriousness of going A. W. O. L.
- (i) Personal relations of chaplain and soldier.

(4) This program, from the time the recruits are marched to the information tent until the conclusion of the chaplain's talk, consumes approximately 45 minutes and sends the men to their company streets with some clearer ideas of what we are fighting for and what soldier discipline means; of what their immediate future training involves, and with something, too, of the spirit of the camp imparted to them.

(5) Either immediately following the program just outlined, or in any event within the first 24 hours, the recruits are detailed to the Young Men's Christian Association Building, or to some other suitable place, to write and mail a letter home. In this communication they were required to inclose the following letter, giving their address and signed by the battalion commander:

CAMP GREENLEAF,

Fort Oglethorpe, Ga.,-----

----- has safely arrived at this camp. (Date) He will remain here for some time, getting used to Army life, and learning the first simple things that our soldiers must know.

The Army supplies him with clothing, shoes, good food, comfortable quarters, and medical attendance. But in another way your help is needed. Give him the support of your confidence and cheer.

Write to him often! Getting mail is a big event in a soldier's day, and getting none is a real disappointment. If pleasant things happen at home, write him about them. If you are proud of him, tell him so. *Let him know that you are back of him.*

Don't be worried if your first letters to him are delayed; that is bound to happen sometimes. Keep writing just the same, and we will see that he gets all you write, even if it takes a little time.

Remember always that you, too, are a part of the American Army—you are the army of encouragement and enthusiasm. Write letters filled with these things to your soldier, and you will help us to help him.

His address is: Company -----, Battalion 15, Camp Greenleaf, Ga.

N. T. KIRK,

Major, M. C., Battalion Commander.

This letter also serves a double purpose: That of promptly informing the people at home of the safe arrival of the soldier at his new address, and that of enlisting civilian support. The replies to these letters received by the battalion commander indicate their value as a stimulus of both civilian and soldier morale.

D. *Personal attention.*—In each company, as previously indicated, there is a representative of the morale organization, known as the sick sergeant, who performs, among

other tasks, the duties of that office. In addition, this soldier serves as a source of general information, visiting the tents, giving short informational talks, disseminating notices and programs, leading in mass athletics and company singing, acting as noncommissioned officer in charge of mail, and in general serving in such other less specific ways as may contribute to the upbuilding of soldier morale. He reaches men not only at sick call, but during rest periods in drill and in the evening. He stimulates group athletics, the organization of teams, and intercompany games. He supplies the company bulletin boards with programs, cartoons, illustrations, and other literature of morale value.

E. Group entertainments.—Entertainment programs lasting for from two to two and a half hours each evening are provided at the open air theater or in the huts and tents of the Young Men's Christian Association, Knights of Columbus, and Jewish Welfare Board, several entertainments sometimes running simultaneously in the same section of the camp. These entertainments comprise vaudeville, boxing, wrestling, band and orchestra concerts, mass singing, motion pictures, war talks, inspirational addresses, and dramatics.

The talent for these programs is generally selected from among the soldiers themselves. The morale sergeant in each company is constantly and systematically on the alert to discover musical or other entertaining ability. Entertainers so discovered are given try-outs, and those of professional excellence serve throughout the camp.

F. Information tent service.—Each of the six sections into which the medical camp is divided possesses a headquarters tent or building. The original information tent in the detention camp is typical; here there is a desk for the section morale officer, his first sergeant, and the morale song leader. There are also desks at this headquarters, or adjacent thereto, for the section entertainment officer, the section athletic officer, the chaplain, and a representative of the Red Cross Society, together with such stenographers and orderlies as might be necessary for effective paper work. Near this headquarters is located a section bulletin board (to which further reference will be made).

There is a daily meeting of morale sergeants with their section morale officer at a stated time for the discussion of problems and the submission by each sergeant of a daily written report of activities in his respective company, with such suggestions for the improvement of company morale as may from time to time appear desirable. At these meetings, athletic schedules are arranged, companies are matched in volley ball, baseball, and the like, and conflicting schedules are adjusted.

G. Upon transfer of men from the detention camp to other sections of Camp Greenleaf, they receive a brief farewell talk by the chaplain or by his representative, and are frequently led for a few minutes in singing and cheering.

EXTENSIVE MORALE WORK—ORGANIZATION

A. Headquarters.—The headquarters of the camp morale officer are located in the psychology building. These headquarters serve as an office for the camp morale officer and his immediate assistants, including the publicity and entertainment directors, and in addition provide a desk for the Army song leader and the Army dramatic director. The headquarters of the athletic director, chaplains' association, Red Cross, Young Men's Christian Association, Young Women's Christian Association, Knights of Columbus, Board of Jewish Welfare Workers, and American Library Association are easily accessible. The office of the War Camp Community Service in the near-by city of Chattanooga, through which all civilian entertainments clear, is in daily communication with this office.

B. Coordination and direction of morale work.—In addition to the intensive work above described, the camp morale officer coordinates and directs all agencies directly or indirectly influencing the morale of soldiers. Chief among such agencies in this camp are the Commission on Training Camp Activities, represented directly by the Army song leader, the Army dramatic director, and the social hygiene division, and indirectly by the Young Men's Christian Association, the Young Women's Christian Association, the Knights of Columbus, the Board of Jewish Welfare Workers, the American Library Association, and the War Camps Community Service.

The coordination of these various activities is accomplished by means of frequent conferences of their representatives with the camp morale officer and by weekly reports which are submitted either to the section morale officer or directly to the camp morale officer. These

reports in turn serve as a partial basis for a general weekly report, covering all phases of morale work, submitted by the camp morale officer to the commandant. These agencies submit schedules and programs weekly in advance to the camp morale officer, in order that camp activities may be systematically directed by his office. These activities are then included in the complete weekly program for the entire camp which is submitted to the commandant and is published in advance in the camp and city newspapers. All of these organizations are offering heartiest cooperation and assistance of a very material and practical sort, making possible the outlining of coordinated and nonconflicting programs throughout Camp Greenleaf.

C. Critical and corrective aspects of morale work.—(1) The civilian relief department of the Red Cross investigates and ameliorates unfavorable conditions discovered through morale agencies in the home life of the soldier.

(2) Investigations are made and reports submitted, either to company commanders, to section commanders, or to the commandant, upon canteen service, unsatisfactory mess, unfavorable conditions, easily avoidable, among guardhouse prisoners, unsanitary latrines, poor washing facilities, overharsh or indifferent treatment of soldiers by noncommissioned officers, and in general all those minor but persistent depressants that unavoidably occur from time to time in any company.

D. Material and equipment.—On the material side, tents, labor, and office supplies are furnished through the military; a monthly allowance of \$250 is granted morale headquarters from the canteen fund for general morale purposes other than athletics and set entertainments, which are financed by separate funds. Lumber, moving-picture machines, song sheets, some athletic equipment, musical instruments, and the like, are from time to time generously furnished by the Young Men's Christian Association and by the Red Cross. Minor athletic equipment is obtained through company funds.

E. Miscellaneous.—For special purposes, such as the Liberty loan drive, the morale organization serves as a convenient agent.

EXTENSIVE MORALE WORK—IN THE FIELD

A. Staff.—(1) The camp morale headquarters staff comprises the following personnel: Morale officer; his assistant; directors, respectively, of entertainments, athletics, music, dramatics, and publicity; two stenographers; a side-car driver; and an orderly. At this central office is held the weekly meeting of the morale officers of each section, who meet for conference. An athletic officer and representative from the chaplains' association, the Red Cross, and other civilian agencies are free to attend these meetings and usually do so.

(2) To these central offices come the weekly reports of the section morale officer and the various departments working under him; requests for music, entertainment, and athletic games; and requests through the office of the War Camps Community Service, as well as offers of entertainment from the citizens of Chattanooga. In this way, the various sections of the park are kept in mutual close relations, and the camp as a whole related to the city of Chattanooga.

(3) Each section of the camp has a morale organization of its own, as has been indicated, based upon that originally established in the detention camp, with such modification of staff and method as its own peculiar conditions make desirable. In general, this section morale organization, while, of course, directly responsible in military matters to the section commander, is otherwise responsible to the camp morale officer, who is in turn directly responsible to the commandant. Thus an organization exists for the speedy and effective accomplishment of such morale purposes as the commandant may from time to time suggest; and, on the other hand, unfavorable conditions difficult to remedy through the often overcrowded military channels can, by this means, be promptly ameliorated. A similar table or organization could be devised for a divisional camp, in lieu of that which was in force at Camp Greenleaf, where the medical units effect a rather unusual unit grouping. Such a section unit of this camp includes from 2,000 to 8,000 men.

B. Entertainment.—The entertainers of professional excellence, discovered and selected by the entertainment directors, as previously described, are segregated in a special entertainment company adjacent to the camp morale office, that their services for rehearsals and entertainment may be readily requisitioned. Transportation for these entertainers is

furnished on schedule as submitted to the transportation department. These entertainers at present approximately 75 in number, perform regular company duties until 1 o'clock, when their time is placed at the disposal of the dramatic and song directors for rehearsal and entertainment. All entertainment throughout the camp is requisitioned upon printed forms at least a week in advance, and programs covering these entertainments are similarly scheduled in advance as previously indicated. In addition, a report is made by the section morale officer or his representative upon the morning following any regularly staged entertainment, giving criticisms and suggestions for its improvement. Card indices are kept of all talent and bookings, so that ineffective entertainers may be weeded out and their places filling by incoming material of higher grade. These records are also kept in order to avoid overworking certain men at the expense of others. No man is held in the company longer than three months, and any man may be sent back to regular duty at any time upon recommendation of the camp morale officer. It is the present intention to group these entertainers from time to time, to be sent overseas as integral parts of base hospital units. In addition to entertainment furnished by the "Barnstormers" (professional entertainment company), section morale officers, the Young Men's Christian Association and the Knights of Columbus provide entertainment furnished by local talent. Motion pictures are supplied by the Young Men's Christian Association on a regular schedule to the various airdromes and Young Men's Christian Association buildings, and in addition a number of pictures, secured either by purchase or through the courtesy of film companies, are shown throughout the camp and then returned to the detention camp, where they can be repeated approximately every two weeks to a new group.

Such pictures as "The Unbeliever," "The Crossbearer," and "Keeping Fit to Fight" are illustrations of films permanently kept in the camp and primarily designed for use in the detention camp.

C. Athletics.—(1) Athletic organization:

a. Camp Greenleaf is divided into two tactical units, as follows: Tactical Unit No. 1—Detention camp, Fort Oglethorpe, medical officers' training camp, Section A (under the direction of Athletic Director Dennis W. Sullivan, captain, Medical Corps). Tactical Unit No. 2—Section B, Section C, Section D, Section E (under the direction of Athletic Director J. C. Montgomery, first lieutenant, Medical Corps).

b. Tactical unit directors are responsible to the camp morale officer for the athletic program of the camp (athletic program does not include military physical training; e. g., drill, setting-up exercises, etc.). Reports for each week's activities are submitted to the camp morale officer by Monday 6 p. m. The tactical unit director selects and requests the appointment of an athletic officer for each group under his direction; such athletic officer may be the morale officer for that group himself, where desirable. The tactical unit director exercises supervision over the recreational activities of athletic nature in his unit, and is the deciding authority in case of conflicts within that tactical unit. Intergroup athletics are promoted by the tactical unit director only.

c. Group athletic officers are responsible to their tactical unit director for intragroup recreational athletic organization. Schedules and reports are submitted to the tactical unit director as requested by him. Group athletic officers' work in conjunction with athletic officers of the Young Men's Christian Association, Knights of Columbus, etc., and make the best use possible of available officers and enlisted men in perfecting their group athletic organizations. Group athletic officers further cooperate with entertainment directors in the production of evening entertainment, and submit names of athletic talent with professional qualifications, e. g. boxers, wrestlers, tumblers, etc., to the camp entertainment director, in order that the latter may request the retention of such men in the camp for entertainment purposes.

(2) Athletic games: Regular baseball, volley ball, soccer, and football games are arranged between various units throughout Camp Greenleaf, and during the season a football team will represent the entire camp. Mass games are conducted regularly each day at such times as section commanders may designate. Athletic equipment is supplied by means of funds from the canteen, company funds, and to some extent from the Young Men's Christian Association.

(3) Special athletic features:

a. An outdoor gymnasium has been constructed, the field used for this purpose being approximately 600 feet square. The following apparatus and game courts are located on the field: 8 volley ball courts, 5 indoor baseball diamonds, 1 baseball diamond, 1 cage ball court, 2 basket ball courts, 2 soccer fields, 1 wall scale, 1 trench jump, 1 horizontal bar (for 8 men), 1 set parallel bars (for 8 men), 1 horse (for 8 men).

This equipment makes it possible for this field to accommodate 5,000 at one time. When organized under the supervision of one man, with the assistance of a bugler, most effective use can be made of limited equipment. Every soldier in section B is detailed to this outdoor gymnasium for one hour and a half on three days each week. For the first half hour, calisthenic drills are given to the men, the remainder of the period being used for mass games.

b. Located near the outdoor gymnasium is a completely equipped football field. A natural amphitheater was selected for this site, and although no benches or stands have been constructed, 7,000 persons may easily view a game played on this field. It is also intended to use this field for interorganization soccer games.

c. Swimming pool, section B: In the spring of 1918, under the supervision of the Army engineers, a depression formed by an old stone quarry in section B of Camp Greenleaf was thoroughly cleaned up and all surface drainage and seepage removed by means of proper sloping of the banks. In addition, the sides and the bottom of the pool were coated with cement, thus avoiding contact with any substance except the original stone of the quarry.

As completed, this pool forms a body of water averaging about 240 feet in length, 75 feet in width, and from 3 to 15 feet in depth. Its capacity is 969,150 gallons and accommodates daily approximately 1,200 men. The pool is equipped with three spring boards and sufficient equipment for water polo games. On one side of the pool there is a safety zone of shallow water with a wire-netting partition, where nonswimmers may enjoy themselves without danger. The entire pool, with complete equipment, represents an expenditure of nearly \$9,000, which was borne in large part by the local branch of the American Red Cross. Through the generosity of this organization, 600 bathing suits are available for the use of the men of Camp Greenleaf. A bathhouse is located conveniently near the pool. Sterilization of the water is provided for by means of an electric pump which forces the water through a chlorine tank, thence out into the pool by means of a spray from a 6-inch pipe, aeration being thus provided. At intervals, depending on the extent to which the pool is used, chemical and bacterial analyses are made of the water. All men entering the pool are required to take a thoroughly cleansing shower bath, and in addition are at the same time inspected for any sign of skin disease. As a result of these precautionary measures, there has at no time been found any dangerous element in the water.

(4) Athletic entertainment: Instruction is given in swimming, boxing, and wrestling. Swimming meets are held, and such special features as a Wild West show, boxing and wrestling bouts, etc., are staged from one to three times a week in all open-air theaters.

D. *Education*.—A school for illiterates has been based in most sections of the camp upon that worked out in the detention camp, where it was found highly desirable to have several small schools, held nightly from 6 to 7 p. m. in mess halls adjacent to the several company streets, rather than to attempt to hold a single large school where much valuable time would invariably be lost. In these schools the morale sergeants act as principals, and select other teachers from their respective companies, to give instruction under the guidance of the chaplain and the Young Men's Christian Association educational secretaries.

E. *Publicity*.—(1) News bulletins: Beside the information tent in the detention camp is a large bulletin board labeled, in letters conspicuous from a distance, "Information." A similar board has been or is being constructed near the morale headquarters in each of the other sections of the camp. On this board are posted news bulletins of current events, especially with reference to the favorable progress of the war; entertainment programs; notices of athletic games and scores; and such general material as maps (both local and war maps), letters from the front, war poetry, clippings, etc.

(2) Two or three times a week, in the various airdromes, five-minute talks are delivered, usually by a Young Men's Christian Association secretary, describing the progress of the war

and illustrated by means of lantern slides. Slides are used also in connection with the motion pictures to make announcements, to teach the camp songs, and to summarize the war news of the day.

(3) A series of posters on morale subjects is being designed, some with reference to the early stages of recruit life, others dealing with the later developmental phases of a military career. Five expert illustrators work under the immediate direction of morale headquarters, having in view a series of art posters for use in connection with the Liberty loan campaign.

(4) A "departure card" of postal-card size has been designed, and is being printed for use when a soldier is transferred to a new organization. A cartoon covering one-half of this card is amplified by means of a legend as follows:

Dear-----

Here we are at the next stopping place *on our way to Berlin*. We have just been transferred here. You see, we are always moving, and in the right direction!

Be sure to write me at once. Use the new address given below and your letters will not be delayed.

As ever yours,

My new address is:

When a soldier is transferred from the detention camp to some other section of Camp Greenleaf, he promptly receives one of these cards and is required to send it home, in order that his people may have prompt notice of his new address. A series of such cards, different in details, but with a general morale purpose, are designed. Whether transferred or not, soldiers in this camp are required to write home at least twice each month, and a roster is kept to see that they do so.

(5) Through the courtesy of the Young Men's Christian Association and the local editor of *Trench and Camp*, one or more pages of this publication are placed at the disposal of the morale organization each week. This space is utilized for the printing of entertainment and athletic programs, for cartoons, and for such literature in prose and verse as may be devised to further the interests of soldier morale. This privilege also enables the morale staff to advertise various features of their work—e. g., the activities of the entertainment company—more widely and more promptly to the soldiers at large than would otherwise have been possible.

(6) A series of talks upon such topics as the following: "Why we are at war," "Why we are sure to win the war," "Traditions of the American Army," "Opportunities for self-improvement in the Army," "What victory will mean to me," "The necessity for discipline and obedience," "Ten reasons why we are at war," "A message to Garcia," by Elbert Hubbard, have been prepared and distributed to company commanders for use in their daily talks to the men of their command, and at present a large number of four-minute talks are being prepared, to be given either by company commanders or by morale sergeants during rest periods at drill or upon other frequent and informal occasions.

(7) Several plans are contemplated for widening the scope and usefulness of this publicity department. For instance, it is proposed that further efforts be encouraged to acquaint the registrant with the sort of conditions which he will meet when he actually enters the Army, giving him information concerning his equipment and the new life as he will find it, in order to allay foolish and unnecessary but very real fears of anticipation. It is hoped to make contact with civilian news sources, with a view to the minimization of the difference between the civilian and the military attitude. As he becomes better informed the young soldier will become the more readily amenable to Army discipline and will come the more quickly to sympathize with Army ideals.

F. *Special work among negro troops.*—The negro soldier presents a distinct morale problem, particularly with reference to the organization and conduct of athletics and entertainment. Since he is not permitted to attend the group entertainments or to take part in the general athletics, it is found necessary to develop these morale activities within the negro groups. Special entertainments are staged for the negro troops in a tent furnished for this purpose by the Young Men's Christian Association. Athletic games and contests are organized within the colored group, and sufficient equipment for this purpose is provided.

Although the appointment of white morale sergeants for colored units brought good results, it was deemed advisable to select colored soldiers with the proper educational qualifications for this purpose, since they could naturally make more intimate contacts with the men.

G. *Mental attitude of recruits*.—A questionnaire has been devised and is being printed in order to determine, upon the basis of 15,000 answers from recruits in the forthcoming draft, the mental attitude of the average soldier during his first weeks in the Army. In so far as it may be unfavorable an attempt will be made to offset it by means of specific and carefully directed propaganda. The questionnaire follows:

Date.....

(The name is not to be given.)

Town..... County..... State.....

How long in the Army.....

Married..... Single..... Family..... How many children.....

Age..... Occupation..... Wages.....

Where born..... Education.....

1. Were you anxious to get into the Army?
2. Is the Army life what you expected, or better, or worse?
3. Did you leave things at home in good condition? If not, what is the trouble?
.....
4. How often do you hear from home?
5. How many letters do you write a week? To whom?
6. Do you get enough to eat?
7. Do you think you are overworked?
8. Do you like to drill?; to salute?; to say "Sir" to officers?
9. Do you get all the information you desire about the Army? If not, what is lacking?
10. From whom have you learned most about what you are to do?
11. Do you understand why you are inoculated ("shot")? Did you dread it?
12. Do you attend the entertainments regularly?
13. What kind of entertainment do you like best?
14. Have you learned the Army songs? Which one do you like best?
15. How would you prefer to spend your spare time?
16. Are you anxious to get to France?
17. Does the uncertainty of what will be done with you bother you?
18. When the war is over would you prefer to continue in the Army or go back home?
19. Do you dread the future or look forward to it?
20. What bothers you most?
21. What has helped you most in the Army?
22. Do you feel that anyone has been unkind to you or mistreated you Who?

H. *Miscellaneous*.—(1) Instructions are given to the chaplains and other morale officers that men shall be particularly warned against the offense of A. W. O. L., since it is found in this camp that a very large majority of court-martial cases are of this sort. Criminal offenses are rare.

(2) Acting morale sergeants, when their service justifies it, are promoted to corporals, sergeants, and sergeants first class. It is hoped that the value of morale work might become sufficiently widely recognized that, to the rare man of the type required, in order adequately to exercise the functions of a morale sergeant the open road to promotion may be offered. This will mean that such a man might look forward to an earned commission. Otherwise there is danger that these desirable men, seeing no future, may strive for transfer to other branches of the service, and thus become a loss to morale work at the very time when their experience make them particularly valuable.

GENERAL INSTRUCTION FOR OFFICERS

While the general course of instruction for officers was prescribed by the Surgeon General, the method of imparting this instruction was left entirely in the hands of the camp commander. After much thought it was decided that the university method of teaching should be adopted and that there should be one basic course of three months' instruction for the entire camp. Clustered around this basic course a number of special courses were to be added as fast as possible, but the essential feature, the basic course, was not to be disturbed by these additions.⁶ By this it was meant that even if an officer were assigned to a special course he would still continue to take the basic instruction. These special classes were not meant to be substitutes but additional courses. Lectures in the basic course were given by the best qualified officers and, as far as possible, no officer was to be called upon to instruct in a variety of subjects.

At first all instructors were required to attend all lectures so that they would be familiar with the ground covered by the lecturer.¹⁹ After the lecture was given, the student officers were required to carefully study the subject and to recite on the subject the next day. In the beginning the instructors who conducted the recitations were the original Regular and National Guard officers detailed to the camp, but as instruction progressed the company officers were able to take up this work and conduct the recitations in their companies.⁶ The companies were further divided into smaller groups under student non-commissioned officers who conducted quizzes. As the original instructors were gradually relieved from the duty of conducting these recitations they were intrusted with the supervision of the recitations. These supervisors also kept in close touch with the individual officers to observe their progress and make recommendations for assignments of those qualified.¹⁹

Existing circumstances did not permit the ordering of student officers to the camp in groups for a definite period of instruction so that the whole body could begin the course together. They straggled in gradually throughout the history of the camp. To combat this evil all officers reporting after the beginning of each course were required to attend night quizzes in their companies.⁶ ⁷² These were held by the best qualified student instructors and were intended to bring the training of the individual officers up to one standard. Those reporting during the latter half of the course could not well do this on account of the large amount of instruction already given. These took all the work they could grasp and were enrolled in the next class.⁶

The three months' basic course outlined below was intended to cover the duties of a medical officer very thoroughly, but, unfortunately, due to urgent military necessity, many officers had to be detailed away from camp before the course was completed and therefore these men were only partially trained.⁷²

Within a short time after the opening of the camp the most promising of the student officers were being utilized as instructors. At first they were largely employed as company officers, drill instructors, and quiz masters. Later on those showing energy and ability were detailed as junior instructors. From the time of the opening of the camp one of the principal objects sought was to

prepare reserve officers for duty as instructors and administrative officers so that they could take over the administration and instruction of the camp. A number of reserve officers became very proficient teachers of Medical Department administration and the duties of medical officers in the field.

All officers reporting for instruction were assigned to the medical officers' training group. Each officer was given an examination by a board of medical examiners composed of the directors of the various schools, to determine his professional qualifications. All officers were then required to take the basic course, which primarily consisted of three months of intensive study along medico-military lines. Every student officer was required to take an oral examination in medicine and surgery and in any special branch of medicine in which he had previously received special training or in which he considered himself qualified. This examination was held, as has been stated before, at the time of entrance into the camp. Those men who were found to be poorly qualified professionally were sent to a school of either medicine or surgery or to both, if found necessary. These courses consisted of 15 lectures and quizzes in each subject. The poorly prepared students were required to attend the lectures in these courses regularly, in addition to the regular camp instruction. At the end of each course, a written examination was held and anyone who failed in this examination appeared before a board to determine whether or not he should be retained in the service. The chief object of the courses was to give the men a review of the essential features of medicine and surgery with which they should be familiar before being placed in positions of responsibility. If any of the student officers were found to be so deficient in professional qualifications as not to justify being sent to these courses of instruction they were sent before a special board, which was convened under War Department instructions.⁷³ After considering the man's professional rating and his general personal equation, the board then decided whether it would be to the best interests of the service to retain him or to have him honorably discharged as not suitable for the service; recommendations were made accordingly. It was a function of this board to determine, as nearly as possible, the exact professional qualifications of the men, with a view to recommending them for the positions for which they were best suited, and to see that they were given the necessary instruction whenever further training was needed.⁶

One week after their arrival in camp the student officers were classified by the board as follows: ⁶ Class A: Officers partially qualified and available as instructors along certain lines. Class B: Officers who had received some instruction, and who were qualified as instructors in any line. Class C: Officers who had received no previous instruction. Promotion to and demotion from each class continued throughout the entire instruction period. With the exceptions noted above, all student officers were held in class C, and later an additional class, D, was added, from which they were advanced to grades B and C by their company commanders as they improved in efficiency. Grade A was given only on the recommendation of the battalion commanders to the commander of the group who had the candidates examined. This examination was held by the senior instructor and his first assistant, and the student was obliged to pass the examination to qualify for the grade.⁶ At the termination

of the course, assignments were to be made for those remaining in class A. This system did not remain long in force due to the fact that a great many officers had to be ordered to other camps before the original three months' course was completed.

Cadet captains of companies were appointed by battalion commanders and held office for two weeks.⁶ Each battalion commander had five instructors who assisted him in the instruction and administration of the battalion. These instructors were grade A men, who were recommended by him to the group commander, and if they met with the approval of the latter officer, were detailed for the work. One of these instructors acted as battalion adjutants and the others as permanent company commanders.

The schedule for the basic instruction was outlined as follows:⁷⁴

FIRST WEEK

6 a. m.-----	Reveille.	11.30 to 12. 55----	Dinner.
6. 15 to 6. 30-----	Setting-up exercises.	1 to 1. 55-----	Medical Department drill.
6. 35 to 7. 25-----	Breakfast and police of quarters.	2 to 2.55-----	Lecture (b).
7. 30 to 8. 25-----	Foot drill.	3 to 4-----	Recitation, except Saturday.
8. 30 to 9. 25-----	Foot drill.	4. 15 to 5. 15-----	Instruction in French, except Saturday.
9. 30 to 10. 25-----	Lecture (a).		
10. 30 to 11. 25----	Recitation, except Monday.		

LECTURES

Monday:

- (a) Address by commandant.
- (b) Customs of the service.

Tuesday:

- (a) Personal equipment of the sanitary soldier. Field and surplus kits.
- (b) Care and maintenance of soldier's equipment.

Wednesday:

- (a) Duties of the soldier.
- (b) Duties of the soldier.

Thursday:

- (a) General organization of the military forces.
- (b) General organization of the Medical Department for war.

Friday:

- (a) General organization of the Medical Department for war.
- (b) Nature and employment of regimental medical supplies.

Saturday:

- (a) Nature and employment of regimental medical supplies.
- There was no afternoon work on Saturday.

SECOND WEEK

6 a. m.-----	Reveille.	10. 30 to 11. 25--	Instruction (b).
6. 15 to 6. 30-----	Setting-up exercises.	11. 30 to 12. 55--	Dinner and recreation.
6. 35 to 7. 25-----	Breakfast and police of quarters.	1 to 1. 55-----	Recitation on 9.30 instruction. Officers to be graded on all recitations.
7. 30 to 8. 25-----	Foot drill. Class A men to act as instructors for student companies and enlisted recruits.	2. 15 to 4. 25-----	Recitation on 10.30 instruction.
8. 30 to 9. 25-----	Same as preceding hour.	4. 30 to 5. 15-----	Instruction in French.
9. 30 to 10. 25-----	Instruction (a).	6-----	Supper.

LECTURES

Monday:

(a) A. R. 1471 to 1473, 1486 to 1488, M.M.C. 206 to 208, 12, 13, 18, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46.

(b) Papers connected with sick call; Form 71 M. D., and Forms 332 to 339 A. G. O.

Tuesday:

(a) M. M. D. 427 to 464 (four days allowed to complete these paragraphs).

(b) Papers connected with S and W report (four days allowed to complete this instruction).

Wednesday: Same as Tuesday.

Thursday: Same as Tuesday.

Friday: Same as Tuesday.

Saturday: (a) and (b) Talk on sanitary inspections, followed by an actual inspection of the entire camp by the student body under the direction of their company officers.

Saturday afternoon, 2 to 4, construction of camp sanitary apparatus.

THIRD WEEK

6 a. m.-----	Reveille.	9.30 to 10.25-----	Instruction (a).
6. 15 to 6. 30-----	Setting-up exercises.	10.30 to 11.25-----	Instruction (b).
6. 35 to 7. 25-----	Breakfast and police of quarters.	11.30 to 12.55-----	Dinner.
7.30 to 8.25-----	Foot drills or litter drill.	1 to 1.55-----	Recitation on 9.30 in-
	Class A men acting as instructors.	2.15 to 4.25-----	struction.
8.30 to 9.25-----	Same as preceding hour.	4.30 to 5.15-----	Recitation on 10.30 in-
			struction.
			Instruction in French.

LECTURES

Monday:

(a) M.M.D. 182 to 203, 414 to 417, 634, 153, 248 to 262. A. R. 1386, 1387, 283 to 290, 1447, 1448, 1450 to 1452, 1454 to 1456, 1461, 1462, 316 to 324.

(b) Sanitary reports. Hospital fund.

Tuesday:

(a) M.M.D. 496 to 508, 512 to 526.

(b) Property papers, I and I reports and boards of survey (four days allowed for this).

Wednesday:

(a) A. R. 657 to 671, 673 to 701.

(b) Same as Tuesday.

Thursday:

(a) A. R. 702 to 703, 710 to 726.

(b) Same as Tuesday.

Friday:

(a) A. R. 903 to 912, 914.

(b) Same as Tuesday.

Saturday:

(a) Relation of Medical Department to rest of Army.

(b) Sanitation and instruction similar to previous Saturday.

Saturday afternoon, 2 to 4, practical sanitary work.

FOURTH WEEK

6 a. m.-----	Reveille.	9.30 to 10.25-----	Instruction (a).
6.15 to 6.30-----	Setting-up exercises.	10.30 to 11.25-----	Instruction (b).
6.35 to 7.25-----	Breakfast and police of quarters.	11.30 to 12.55-----	Dinner.
7.30 to 8.25-----	Monday, Tuesday, and Wednesday, tent pitching—shelter and pyramidal.	1 to 1.55-----	Recitation on 9.30 in-
		2.15 to 4.25-----	struction.
8.30 to 9.25-----	Same as preceding.	4.30 to 5.15-----	Recitation on 10.30 in-
7.30 to 9.25-----	Thursday, Friday, and Saturday, foot and litter drills.	6-----	struction.
			Instruction in French.
			Supper.

LECTURES

Monday:

- (a) First aid, using soldier equipment.
- (b) Examination of recruits, recruiting papers, and finger prints (four days allowed).

Tuesday:

- (a) Nature and employment of regimental medical supplies.
- (b) Same as Monday.

Wednesday:

- (a) Same as Tuesday.
- (b) Same as Monday.

Thursday:

- (a) Military hygiene and sanitation (based on first and second chapters, Lelean).
- (b) Same as (a).

Friday:

- (a) Military hygiene and sanitation (based on third chapter, Lelean).
- (b) Field service regulations (one-half of book).

Saturday:

- (a) Field service regulation (second one-half of book).
- (b) Recitation on field service regulations.

Saturday afternoon, 1.30 to 2.30, continue (b).

The schedule for the remaining two months was identical in form, being changed in detail to suit the individual subject.

The foundation of the military instruction follows:⁶

1. *Physical instruction*.—(a) Regular and systematic exercises were prescribed. All student officers were given at least one-half hour a day in this work, and most officers received two hours equitation per week. Those officers who were poorly developed were given special attention, particularly those of 40 years and upward who could not stand the more strenuous exercises provided for the younger men.

2. *Military drill*.—(a) School of the soldier and the detachment. Each company for one hour daily was split up into groups of one or more sets of fours, and each man was given opportunity to drill the detachment for a short period to give him confidence and training in handling men.

(b) Company and battalion drills were held daily for periods of from 15 to 30 minutes, at the discretion of the battalion commanders.

(c) Litter drill for one hour in the afternoon by sections of each company. Special attention was paid to the loading and unloading of the litter.

(d) Practice marches were held at intervals in the place of drill, when the battalion commander so ordered.

(e) Practice in giving commands for one-half hour, or three times a week, to small groups.

(f) Each battalion was given at least one three-day hike with a field hospital company and an ambulance company, where actual field conditions were encountered.

The following order gives a clear understanding of the practice marches for student officers:⁷⁵

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., May 31, 1918.

General Orders, No. 51.

1. A series of practice marches for student officers, to begin on Monday, June 3, and continue until further notice, is hereby established.

For the present, these marches will be made to the Government rifle range, Catoosa Springs.

2. Each practice march will cover three days. Weather permitting, it will begin on Monday and Thursday of each week. Each student battalion will make not less than one practice march monthly.

3. Marches will be made by student battalions, separately and in succession. All personnel of the battalion, other than the sick and two student officers in each company to be left in charge of barracks and property, will make the march. Company commanders will satisfy themselves as to the physical fitness of all who take the march and insure that they are properly shod.

4. The rear of the student officers column will clear the camp not later than 6.30 a. m. at the cantonments formerly occupied by the 81st Field Artillery, where it will be joined by the sanitary units designated to participate in the march.

5. Each officer will carry on his person light field equipment, to include ration bag, raincoat, shelter tent half with pole and pins, mess kit, and canteen.

6. Each officer will be entitled to have transported for him, by truck, one small bedding roll, to include canvas roll, mattress, not exceeding two blankets, and such underclothing and toilet articles as may be necessary.

7. No separate mess for student officers will be provided, but they will be subsisted from the messes of the ambulance company and field hospital company.

Rations for two and one-third days will be carried. The company funds of the ambulance company and field hospital company will be entitled to reimbursement from the officers' mess for the cost of rations consumed, and to receive in addition a gratuity of not exceeding 25 cents for each student officer thus subsisted.

8. The commanding officer, hospitals and trains group, will designate one ambulance company and one field hospital company, both animal drawn, to accompany each battalion. The above organizations to carry full field equipment, tentage, both light and heavy, and supplies. A water cart will accompany these units.

He will also provide motor transportation for the bedding rolls above authorized to be carried for officers.

9. The commanding officer, student officers' group, will designate such instructors to participate in the march or campfire conference as may be necessary to proper training.

10. The senior instructor or organization commander with the command will command the whole, and be responsible for the proper execution of the provisions of this order.

11. The first day's march will be from headquarters, Camp Greenleaf, to the springs at the Lansford farm, distance 6.7 miles.

The march will be used as an object lesson in route marching, but a halt of 10 minutes, after every 20 minutes of marching, will be required.

Student officers showing any evidence of distress will be relieved of their packs, or, if necessary, ordered into ambulances for transportation. Company commanders will be held responsible for this.

Both student officers and sanitary units will bivouac in shelter tents. Student officers will be required to individually cook their own supper from the ration.

Drinking water will be sterilized by chlorination in the Lyster bag.

During the day, and at the campfire conference in the evening, practical instruction will be given in conduction of marches, care of feet, laying out of camps, shelter tent pitching, camp cookery, elementary sanitation, etc.

12. The second day's march will be from the springs at Lansford's farm to the rifle range, Catoosa Springs, distance 7.4 miles. It will be utilized for instruction in route marching as on the previous day.

At this camp, the full tentage and medical department and other equipment of the ambulance company and field hospital company will be pitched, displayed, and its use explained.

The internal economy of such organizations will be discussed and their tactical use in war outlined. The use of cover, terrain, etc., will be discussed.

13. On the third day the equipment of the ambulance company and field hospital will be repacked, the tentage struck, and the transportation loaded. These units will then return independently to Camp Greenleaf.

The student officers will visit the target range, be briefly instructed in small-arms fire, penetration of missiles, trajectories, etc., and, if possible, see a demonstration of rifle and machine-gun fire. If found practicable, a limited amount of pistol shooting by student officers may be had.

In the afternoon the student officers will return to Camp Greenleaf, arriving by retreat, in motor ambulances or motor trucks, which will be sent out for the purpose by the commanding officer, hospitals, and trains group.

14. In case of severe rain, the heavy tentage of field hospital and ambulance company may be used for shelter by student officers.

15. Other than cooking, all work pertaining to the comfort and instruction of the student officers will, as far as possible, be carried out by them.

16. Great care will be taken to have camp sites scrupulously clean and an object lesson in camp sanitation.

17. The quartermaster will make the necessary arrangements to secure the camp sites required, provide the necessary fuel and Havard box latrine accommodations, and accomplish the removal of refuse from the picket lines.

18. The commanding officer, hospitals and trains group, will provide for the permanent marking, in respect to their component groups, of the camp sites to be successively occupied. He will also maintain a detachment of 1 corporal and 4 privates on the Medical Department camp site at the rifle range for the purpose of maintaining scrupulous cleanliness and sanitation of this site.

By order of Colonel Munson:

E. S. SLEDGE,
Major, M. R. C., Adjutant.

Officers were given as thorough instruction in Army Regulations, Manual for the Medical Department, military law, and Field Service Regulations as the time permitted. They were given, in addition, a certain degree of instruction in those principles of military surgery and medicine with which every officer should be familiar. This instruction was given by officers who were qualified along the lines in which they were called upon to instruct.⁶

In September, 1917, stenographic notes were taken of all lectures, the transcripts of which were printed and issued to the classes at the cost of printing, the purpose being to give all student officers a textbook on medico-military subjects in a fairly condensed form.⁷

During October, 1917, the student companies were split up into single squads or groups of four for a large part of the drill period each day.⁸ The object of this plan was to give every man a chance to take charge of and drill a squad. This plan was amplified and specially developed during November, both in foot drill and in litter drill, with beneficial results.

Beginning November 22, a medical officer of the day was appointed daily from one of the battalions, each battalion providing this officer for a period of one week.³ The duties of the officer of the day were in general as follows: (1) General oversight of company streets and buildings; (2) fire protection; (3) ventilation in barracks; (4) condition of bathhouses, with special reference to waste of water; (5) any special conditions that might arise and require to be reported.

After the lapse of several months orders were given that officers who had been reserved by the different professional divisions in the Surgeon General's Office, or who had been found qualified for special instruction by the professional examining board, were to take the basic course for two weeks, and at the end of that time were to be assigned to such special schools as their qualifications indicated.⁶ From the beginning men prominent in the specialties were used to give lectures in their particular fields. They were sent to the camp for that purpose and supplemented the instruction already given by the instructors permanently assigned to the camp.⁶

COURSE FOR LINE OF COMMUNICATIONS SERVICE

In November, 1917, the need for officers for duty with the line of communications being so great and the necessity for full military training for such service being less urgent, the following instructions were sent to the commandant:⁷⁷

NOVEMBER 28, 1917.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: Condensed schedule of instruction for medical officers under training with units for line of communications service.

1. This office is in receipt of the following order: "The Secretary of War directs that you expedite the preliminary training in the United States of service of the rear troops and that such training be reduced as far as possible so as to prepare these troops for service abroad at an early date."

2. In compliance with the above order, medical officers assigned to sanitary formations of the line of communications will receive a course of instruction lasting two months.

3. This course will be based on the general schedule for the training of medical officers in your camp, as set forth in Special Regulations, No. 49a, War Department, 1917.

It will, however, give a minimum of time to subjects relating to service with fighting troops in the zone of operations, and will place proportionately more emphasis on the professional matters and administrative requirements which assume so much importance in the service of the rear.

4. It is important, however, that medical officers for the present intended for service with the rear shall not be without reasonable instruction in matters relating to the zone of operations, since emergency may at any time require their detachment for service with troops at the front.

5. Where practicable, it is desirable that medical officers to be attached to formations of the rear should be given the full three months' basic course of your training camp, with the intensive training for these special formations to follow as a postgraduate course, so that the camps may turn out as comprehensively trained men as time may permit.

6. The schedule for the first month is as follows:

	Hours
Setting up (15 minutes daily for 26 days).....	6.5
Drills (marching, litter, ambulance, other means of transport, etc.).....	52.0
Inspections.....	4.0
Equitation, bridling, saddling, care of animals, etc.....	15.0
Tent pitching:	
Shelter tent.....	2.0
Pyramidal tent.....	2.0
Hospital tentage.....	6.0
Personal equipment of sanitary soldier.....	1.0
Field and surplus kits.....	1.0
Care and maintenance of soldiers' equipment.....	2.0
First aid, using soldiers' equipment only.....	2.0
Examination of recruits, with papers and fingerprints.....	6.0
Customs of the service.....	2.0
Duties of the soldier.....	4.0
Organization of military forces of the United States.....	2.0
Organization of Medical Department for war.....	4.0
Relation of Medical Department to rest of Army.....	1.0
Army Regulations.....	6.0
Manual for the Medical Department.....	12.0
Field Service Regulations.....	6.0
Methods of supply at home and in the field.....	2.0

	Hours
Paper work relating to the—	
Medical Department.....	8. 0
Quartermasters's Department.....	4. 0
Ordnance Department.....	2. 0
Military hygiene and camp sanitation.....	12. 0
Handling of ration and mess management.....	4. 0
Practical sanitary inspections.....	8. 0
Lectures on special subjects.....	4. 0
Total.....	180. 5

7. The schedule for the second month is as follows:

Setting up (15 minutes daily for 26 days).....	6. 5
Drills, marching, litter and ambulance.....	36. 0
Inspections.....	4. 0
The regimental detachment; its equipment, use, and internal administration.....	3. 0
The ambulance company; its equipment use, and internal administration.....	3. 0
The field hospital; its equipment, use, and internal administration.....	6. 0
The Medical Department in campaign.....	6. 0
The principles of sanitary tactics, and map reading.....	6. 0
The evacuation ambulance company; its equipment, use, and administration.....	2. 0
The evacuation hospital; its equipment, use, and internal administration (including its establishment and demonstration).....	12. 0
Paper work, relating to the Medical Department (continued).....	8. 0
Military hygiene and camp sanitation (continued).....	6. 0
Practical sanitary inspections.....	6. 0
Army Regulations (continued).....	6. 0
Manual for the Medical Department (continued).....	6. 0
Manual for Courts-Martial, and Military Law.....	8. 0
The Articles of War.....	1. 0
The Geneva and Hague conventions.....	1. 0
The Rules of Land Warfare.....	2. 0
Military surgery, including splints and splinting, infections, trench foot, etc.....	16. 0
Liquid fire, poison gases, protection against, symptoms and treatment (practical).....	4. 0
War psychoses and neuroses; shell shock, malingering.....	4. 0
Trench warfare, including demonstration of trench system.....	4. 0
The commoner diseases of troops in France.....	6. 0
The sanitary service, line of communications.....	2. 0
Hospital ships; ships for patients; hospital trains; trains for patients.....	2. 0
Base hospitals; their organization and management.....	2. 0
General hospitals; their organization and management.....	4. 0
Contagious disease hospitals; casual camps; convalescent camps; camps for prisoners of war.....	2. 0
Organization, functions and limitations of the American Red Cross.....	1. 0
The civil sanitary function of the Medical Department in occupied territory.....	1. 0
Lectures on special subjects.....	4. 0
Total.....	180. 5

8. Inasmuch as it is possible to supply only a part of the equipment of an evacuation hospital for training purposes at your camp, you should at appropriate times arrange for the pitching in connection therewith of such number of field hospitals as would provide the full tentage of an evacuation hospital, together with such of its equipment as are included in the supplies of field hospitals.

9. When an evacuation hospital is pitched, the opportunity should be taken advantage of to demonstrate the magnitude and equipment of this formation to all officers and men under training in your camp, as well as the personnel assigned to evacuation hospital duty.

10. The training of the enlisted personnel of evacuation, base, and special hospitals should be approximately the same as that now given the personnel of field hospitals, but

leaving out most of the training relating to the management of wheeled transportation, reducing to the minimum instruction relative to the functioning of regimental detachments, ambulance companies, and field hospitals, and emphasizing practical training in ward nursing, surgical assistance, including splint making, dispensary work, care of property, and cooking and mess management.

11. The training of enlisted men for evacuation ambulance companies should be the same as for divisional ambulance companies, substituting more training in bandaging, first aid, splinting, and emergency nursing for a corresponding amount of the field work prescribed in your general schedule.

12. The training of enlisted men for sanitary squads should be approximately the same as for evacuation ambulance companies, but giving a competent knowledge of horsemanship and the use of motorcycles, and substituting for nursing a thorough training in sanitation and hygiene, which latter should relate not only to military camps and stations but to such civilian communities as would be liable to be occupied as billets by troops in France and elsewhere.

13. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON,
Colonel, Medical Corps.

PHYSICAL INSTRUCTION FOR OFFICERS

The physical instruction of the officers always received considerable attention and was conducted by a qualified instructor. It was found that the regular course was too strenuous for the middle-aged officers, and as their number increased, the work was modified by the following order:⁷⁸

General Orders, No. 58.

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., June 6, 1918.

1. The physical instructor of Camp Greenleaf will be responsible to these headquarters for the proper conduct of all matters relating to physical training of officers and men of this command. He will also serve as athletic officer for the camp.

2. All student officers will be given one-half hour's physical training daily, except Saturday and Sunday, unless excused by the camp surgeon.

3. Officers entering the camp, and following their physical examination, will be divided into two classes for physical training; one class composed of those 40 years of age or less, and the other of those over 40 years of age. Officers who may be under 40 years of age, but who, in the opinion of the camp surgeon, are not yet fit to undertake more advanced physical training, will be assigned to the latter class.

4. The physical training of the first-named class will have the purpose of putting participants in excellent physical condition in the shortest practicable time. The exercises, though not arduous, will be comprehensive and progressive.

5. The physical training to be given the latter-named class will, for the first three weeks after entrance, be comparatively less severe. It will be carefully graduated and closely supervised by the physical instructor, who will see that officers receive any individual attention which they may require. He is authorized to assign to certain groups for special training such officers in the second class, as, in his opinion, require a modification of class work.

6. At the end of the three weeks' period, the members of the second class will be examined by the camp surgeon. If certified to by him as to physical competency, they will thereafter be given the more intensive course of physical training carried out by the first class.

Officers whose physical competence for more advanced training is not certified to by the camp surgeon will be continued with their original class until such certificates have been given or other action has been taken in their cases.

7. Physical exercises of student officers will be carried out separately by battalions and for the class of officers over 40 years of age.

The physical instructor will designate assistants who will be in direct charge of each class.

The course of instruction at the camp began to slow up after the signing of the armistice, and in December was discontinued except for some further work conducted by the special schools.⁷²

The following report of the senior instructor sums up generally the aims and the results accomplished during the existence of the camp:⁷²

OFFICE OF THE SENIOR INSTRUCTOR,
Camp Greenleaf, Chickamauga Park, Ga., January 5, 1919.

From: The Senior Instructor.

To: The Commandant.

Subject: Monthly report of instruction, December, 1918.

The course of instruction at the M. O. T. C., Camp Greenleaf, was interrupted and finally terminated during the month of December, except for the special school of Roentgenology, which is still operating and will probably continue to operate during the month of January, or at least the greater part of it.

The school of gas defense discontinued instruction December 11, with the authority of the War Department. The general basic course was discontinued December 20 in order not to delay the demobilization and discharge of student officers. The special schools, with the exception of the X-ray school, closed December 23, on account of the discharge or assignment of the officers undergoing instruction in these schools. As mentioned above, the only instruction now being given is the uncompleted course in the school of Roentgenology.

No changes or modifications of the system of instruction were introduced during the month. A few over 1,600 student officers participated in the basic and special courses. New courses were begun December 1, but none of them was completed. The special school schedules were carried out with success and enthusiasm to the last, and too much credit can not be given the directors and instructors for their excellent work and extremely gratifying results obtained.

Most of the work in the basic course during the past year has been given by the senior instructor and his assistants, Lieutenant Colonel Darby and Majors McKellar and Rubert. The instructors in the basic course have worked continuously and faithfully, much of the time under adverse conditions and with little other than a sense of duty and patriotism to stimulate and encourage them. During the second half of the year, Lieutenant Colonel Williamson and Major Webster arrived, removing much of the burden of teaching from the others, and did their work in a most satisfactory and enthusiastic way.

My experience during the past 19 months had demonstrated conclusively that the art of instructing successfully can not be acquired by many, even though the instructor conscientiously apply himself. Conversely, even those who possess talent and ability do not achieve success unless they work diligently and zealously.

I take this opportunity to express my appreciation of the talent, ability, diligence, and devotion shown and success attained by the corps of instructors at Camp Greenleaf during the past year. I believe few realize the difficulty attended with getting the average doctor direct from civil life interested in and acquainted with military administration and the non-professional duties of medical officers, especially where this has to be done far from the glamour and spectacularity of the theater of operations. The stimulation, encouragement, and animation felt by participants in the sphere of active martial operations is lacking in a training camp and can only be offset where the same courses with new, uninterested students must be repeated time after time, by a rigorous appreciation of duty and the small satisfaction of achieving a modicum of success under uninteresting, adverse conditions.

Since the M. O. T. C. was established at Camp Greenleaf 19 months ago, 12,000 officers have passed through. Unfortunately many of them, due to exigencies of the service, did not complete the prescribed course of training, and not a few of them had only started the course of instruction when ordered away.

Two heavy handicaps have confronted the instructors since the establishment of the training camp—continuous arrival of student officers at camp, making it impossible to put classes through as a unit; removal of student officers prior to completion of the course. Of the two evils, the latter is the greater, as most of these men are imperfectly trained. The

first difficulty can be partially overcome by increasing the number of instructors or unduly increasing the work of the instructor, both undesirable features, usually resulting in the instructor rapidly wearing out or his inability to teach with the desired zeal and enthusiasm. I strongly recommend that if training camps are to be organized in the future every effort be made to remove or overcome these encumbrances.

ROGER BROOKE, *Colonel, M. C.*

GENERAL INSTRUCTION FOR ENLISTED MEN

When the camp was first opened the general instruction of the enlisted men was outlined in the following order:⁷⁴

*	*	*	*	*	*	*
7. As enlisted men report for duty they will be immediately organized into provisional companies as follows:						Men
Provisional motor field hospital companies.....						160
Provisional mule-drawn field hospitals.....						162
Provisional motor ambulance companies.....						238
Provisional mule-drawn ambulance companies.....						300

The first company will be a motor field hospital company.

The second company to be formed will be a motor ambulance company.

The third company to be formed will be a mule-drawn field hospital company.

The fourth company to be formed will be a mule-drawn ambulance company.

8. The provisional director of field hospital companies, as designated in order, will, subject to the approval of the commandant, select two officers from the First Field Hospital of Tennessee National Guard, as his assistants.

Likewise, the provisional director of ambulance companies, as designated in orders, will select two assistants from the 1st Ambulance Company Tennessee National Guard.

9. Provisional companies will be attached for rations to the National Guard companies present in camp until further orders.

10. Upon the recommendation of directors of units "cadet officers" will be detailed by the commandant to perform all of the duties of company officers in each of the provisional companies. It is desirable to change these "cadet officers" as frequently as possible so that a maximum number may have the valuable experience thus afforded. Qualified officers and officers who show no promise of rapidly qualifying for duty with units will be recommended for transfer by directors without delay.

11. Directors of units will be held responsible for the training and discipline of their commands. Training will be along the lines as directed by the commandant and will be coordinated with the general scheme of camp instruction. With these limitations, it is proposed to give directors of units every chance to get results per their own methods.

12. Directors of units will decide upon the attendance or nonattendance upon routine instruction of members of their command. The purpose is to employ the time of every member of this camp to the best advantage.

13. Directors of units will make every effort to develop efficient none commissioned officers. With this end in view they will designate instruction scheduled for classes "A," "B," "C," which may seem to be advisable. This will be in addition to the instruction scheduled for class "D."

14. The first week in camp will be chiefly utilized for purposes of classification. Directors of units will be expected to select very promptly such men as are unfitted for advance instruction. These men will be eliminated from class lecture and quiz work as rapidly as possible, care being taken not to eliminate any man of potential though undeveloped capacity.

The course of instruction of recruits while in the recruit camp awaiting assignment to units began Monday, June 18, 1917. The recruit camp was divided into companies of equal size and number, and with an equal number of noncommissioned officers, Regular Army, assigned thereto. Both companies were under the command of the commanding officer of the recruit camp.⁵³ The following schedule went into effect on that date:⁷⁴

TRAINING

MONDAY

6.45 to 7.15 a. m.-----	Police of tents and camps.
7.15 to 7.30 a. m.-----	Setting-up exercises.
7.30 to 9.25 a. m.-----	Foot drill.
9.30 to 10.25 a. m.-----	Address by commandant, M. O. T. C.
1 to 1.55 p. m.-----	Drill.
2 to 2.55 p. m.-----	Talk on customs of the service by noncommissioned officers.
3 to 4 p. m.-----	First aid.

TUESDAY

6.45 to 7.15 a. m.-----	Same as preceding day.
7.15 to 7.30 a. m.-----	Same as preceding day.
7.30 to 9.25 a. m.-----	Foot drill.
9.30 to 10.25 a. m.-----	Demonstration of equipment of sanitary soldier by noncommissioned officer.
1 to 1.55 p. m.-----	Drill.
2 to 2.55 p. m.-----	Care and maintenance of soldier's equipment by noncommissioned officer.
3 to 4 p. m.-----	Personal hygiene by noncommissioned officer.

WEDNESDAY

6.45 to 7.15 a. m.-----	Same as preceding day.
7.15 to 7.30 a. m.-----	Setting-up exercises.
7.30 to 9.25 a. m.-----	Drill.
2 to 2.55 p. m.-----	First aid.
3 to 4 p. m.-----	Litter drill.

THURSDAY

6.45 to 7.15 a. m.-----	Same as preceding day.
7.30 to 9.30 a. m.-----	Drill.
9.30 to 10.25 a. m.-----	General organization of Army by noncommissioned officers.
10.30 to 11.25 a. m.-----	Method of rolling blanket roll.
1 to 1.55 p. m.-----	Drill.
2 to 2.55 p. m.-----	First aid.
3 to 4 p. m.-----	Shelter tent pitching.

FRIDAY

6.45 to 7.15 a. m.-----	Same as preceding day.
7.30 to 9.25 a. m.-----	Care of animals, talk by noncommissioned officers.
9.30 to 10.25 a. m.-----	Drill.
10.30 to 11.25 a. m.-----	First aid (Sylvester's method of artificial respiration).
1 to 1.55 p. m.-----	Drill.
2 to 2.55 p. m.-----	Camp sanitation, talk by noncommissioned officers.
3 to 4.30 p. m.-----	Clean up for Saturday inspection.

SATURDAY

8 to 8.25 a. m.-----	Inspection.
8.30 to 9.30 a. m.-----	Drill.

Noncommissioned officers in charge of instruction graded each man in drill, practical work, and recitation.⁸⁰

After the camp began to expand the recruits were rapidly assigned to sections where units were being organized.¹⁹

TRAINING THE RECRUIT

During the winter of 1917 and the spring of 1918, the detention group ran noncommissioned officers' and cooks' schools.⁸¹ Many of the men trained in these schools were retained as the permanent training cadre. Other platoon leaders and cooks were obtained from men having former military training in the service or at a military school and from those who had been cooks in civil life.

The daily schedule of training began at 7 a. m. and continued until 4.30 p. m. One hour after supper, from 6 to 7 p. m., during the summer, the companies were turned out for athletics under the direction of the company officer. An outdoor auditorium, seating 3,500 men, was constructed, and a show was run nightly from 7 until 9.30 p. m., under the direction of the morale and athletic officers. Two nights a week were devoted to wrestling and boxing contests. The others were filled with band concerts, vaudeville, etc., staged by the men themselves. Great rivalry was stimulated between the companies. Moving pictures, with excellent films, finished the evening's entertainment. After the recruit had completed the days' work and evening's entertainment, he was too tired and sleepy to get homesick, and found little time to get into trouble.

The morning work started with setting-up exercises for a half hour, given by an excellent instructor, to groups of from 500 to 1,000 men. The company officers and noncommissioned officers were present with each company to correct individual members and to aid the instructor. The company was divided into its platoons, squad and platoon drill being carried on until the company was ready to drill as a unit. The company officers had no other duties and could therefore spend their entire time in training. For a half-hour period each morning, some type of game was run in to rest the recruits from the monotony and to stimulate waning interest. Drill continued during the afternoon. One hour of this was devoted to instruction in the duties of the sanitary soldier, personal hygiene, sanitation, care of equipment, and other subjects a recruit should know. These talks were made very simple so that they were easily understood and were frequently repeated. The first 10 minutes of the talk was devoted to such subjects as, "Why we are at war," "The American Army," etc., which were gotten up by the morale officer to stimulate the recruit's interest and to aid him in thinking correctly. The Articles of War and pertinent camp orders were read and explained to all men during their first 48 hours in camp. If the recruit stayed in camp a month or longer instruction was given in litter drill, tent pitching, and more advanced work. It was believed that the recruit should first be made a soldier and later be trained for special work.

Athletic equipment for each company was purchased with the company fund. There were seven baseball diamonds in working shape on the drill grounds of the organization. Each company was supplied with baseball equipment, boxing gloves, basket balls, footballs, etc. The organization boasted the champion baseball team of the camps in the vicinity, and there was an excellent game on the home grounds twice weekly.

All enlisted men assigned to ambulance companies and field hospital companies during the early days of the camp received general instruction which was a continuation of that in the detention group. This comprised

school of the soldier, litter and bearer drill, tent pitching and striking, individual cooking, transmission of messages, first aid, and practice marches.

Each company was instructed in the pitching of a complete field hospital and upon its completion, in conjunction with the ambulance companies, combined drills and problems were given, making the picture realistic by caring for the wounded brought in from an imaginary firing line through ambulance-company dressing stations.

The course of training and instruction was conducted by the directors, who published at frequent intervals memoranda outlining the work. The work was laid out in a systematic manner and comprised not only the training outlined in the drill regulations for sanitary troops, but also a period of training for each company as soon as it had sufficient preliminary training. During field training the company was entirely self-supporting, living under canvas for 10 days or 2 weeks at a time and carrying out daily field exercises and practice marches.¹⁹

No occupational tables for Medical Department units were made by the committee on classification of personnel until late in 1918. This necessitated the compilation of tables in the camp itself so that men could be assigned to units according to occupational qualifications.^{82 83}

The training of the enlisted men was not entirely satisfactory even as late as September, 1918, due in great part to the urgent demands for men to fill numerous War Department requisitions. This is shown by the following memorandum:⁸⁴

HEADQUARTERS, DIVISION OF HOSPITALS AND SANITARY TRAINS,
Camp Greenleaf, Chickamauga Park, Ga., September 9, 1918.

Memorandum to Col. E. D. MUNSON:

The proper training of the enlisted men of this command has practically ceased. The requisitions of men to be sent elsewhere have mounted up to such a point that at the present time to fill these requisitions we will be obliged to take men from the draft, without their completing the two weeks' detention which has been required.

In the replacement group it has been impossible to give the men anything more than a short two or three days' instruction in military courtesies and what elementary foot drill can be given in that time. The men received from the detention camp in the replacement group are practically immediately assigned out, and leave as soon as transportation is available.

An attempt is being made to classify men according to the methods of the committee on personnel of The Adjutant General's Office but the demands for men have been so great that we have been obliged to send out classified men for general service. In this respect attention might be invited to the fact that a shortage of properly qualified men for the special technical schools is now being experienced, due to this method of assignment which has been forced upon us. On account of urgent telegraphic orders from The Adjutant General of the Army, we have also been obliged to send out 180 men to sanitary train of the 20th Division, Camp Sevier, S. C., at once. These men are no better than the men that the sanitary train could obtain from its own depot brigade.

In the motor group the same conditions obtain, with the exception that qualified motor-men are required to be held for motor units, and we have a few such men on hand who will be assigned out almost immediately. An effort has been made to hold in this group all of the men infested with hookworm in a separate battalion until they are cured, but this has not been found practicable; and we have been compelled to send men for overseas service who are not completely cured of the malady.

In the evacuation group the training of the men has consisted entirely of the school of the soldier, and the longest time these men have been in camp is an average of less than one month. No proper organization of these hospitals with their full permanent personnel has

been possible, and the men going out labeled "Evacuation Hospital No. ——" are only 100 men put together on a train, and their organization is bound to be extremely loose.

The same troubles exist in the hospital group, and though an attempt has been made to train men at general hospitals for ward duties, the number of such men we are able to spare for this training from the constantly moving organizations has been very small.

Every effort has been made, and is now being made, to take properly classified men from the draft and train them in the noncommissioned officers group, leaving them there for a full six weeks' training. Unfortunately, heretofore the number from which these men are taken has been so small that the noncommissioned group, instead of running a capacity of 2,000 men, is now down to less than 700; and we were unable to supply more than 73 noncommissioned officers for the large number of base hospitals recently ordered from this camp. The length of time which these men have been in camp will not average three weeks, and a great many are leaving camp now, or will leave in the next seven days, who have been in this camp less than two weeks.

W. N. BISPHAM,

Colonel, M. C., United States Army.

These difficulties in the way of the proper training of the enlisted men were noted also in the report of an inspection made of the camp on September 11. The following is a quotation from that report:⁴⁴

Men composing the units above referred to are being passed through this camp so rapidly that technical instruction, even of the most primary character, is out of the question. Men are being sent here by the thousands to be trained, presumably for certain definite hospital training, and almost before they are released from detention camp are sent out again. Under the present system this camp, so far as the enlisted personnel is concerned, is only a place where hospital units are thrown together. It is in no sense a training center. If it is desired primarily that the organizations being formed here should be partially trained before leaving this camp, a sufficient reservoir must be built up here to permit of all men being held here for at least two months. As the number and kind of units needed can certainly be approximated two months in advance, no reason can be seen why this should not be done. The present system appears to be extravagant and inefficient, through no fault of the local personnel, and is beyond their means to rectify.

During the month of October, 1918, though few men were received, owing to the influenza epidemic, very few departed, and therefore more time was given to the perfecting of the instruction of the enlisted men of the command.⁸⁵

SPECIAL INSTRUCTION FOR OFFICERS

Special instruction for officers was considered necessary shortly after the camp was inaugurated. In June, 1918, after a conference in Washington between the training division and the heads of the different professional divisions of the Surgeon General's Office, a percentage division of all medical officers was made, giving each specialty a certain percentage of the total officers enrolled.⁸⁶ This was used as a basis for the special instruction of officers at Camp Greenleaf and was outlined in the following order:⁸⁷

General Orders, No. 54.

HEADQUARTERS CAMP GREENLEAF,

Chickamauga Park, Ga., June 4, 1918.

1. The Surgeon General directs that in the training of medical officers the following figures should serve as a general guide to the probable nature of service, the proportion required in each class, and the ratio which should exist for each professional group. It is to be understood that these figures are to be regarded as approximate and not invariable.

2. Out of every 1,000 officers received for training, they should be divided and specially trained about as follows:

(a) For service in the zone of operations, with regiments, ambulance companies, and field hospitals, there should be trained 500.

This class of men should be relatively young, physically sound, mentally alert, who are qualified general practitioners and sanitarians, and who have qualities of leadership and manhood which appeal to men.

These men are, as far as possible, to be given the full basic course of three months.

Out of each 500 of the above, approximately 250 should be specially trained for regimental service, 125 for ambulance company service, and 125 for field hospital service.

(b) For service in the line of communications, home service, special duties, etc., there should be trained 500.

These men should represent the type remaining after the class mentioned in paragraph (a) has been deducted from the student group.

It may include more elderly men, those certified to as fit for home or special service only, and those sent for training by specialists divisions, and reserved for special duty therewith.

These officers should ordinarily take the abridged course of two months, with any special professional training desired in addition.

Out of each 500 in this group, it is desired by the Surgeon General that the following numbers, in each component class, be given special training in professional lines:

Head surgery (including eye, ear, nose, and throat, brain, etc.)	44
Roentgenology	50
Laboratory, sanitation and control of infectious disease	45
Neurology	20
Genitourinary	30
Orthopedic surgery	35
Tuberculosis examiners	20
Cardiovascular examiners, and general medicine	50
General surgery	175
Hospital administration	15
Not specified	16
Total	500

3. Facilities for training in accordance with the requirements of paragraph 2 will be provided accordingly.

4. Instructors in charge of the above courses will inform this office as soon as possible as to what changes or additions in personnel, accommodations, and equipment are necessary to their proper compliance with the instructions of the Surgeon General.

5. For the present, estimates should be based on the probable attendance of 1,500 student medical officers.

By order of Colonel Munson:

E. S. SLEDGE,
Major, M. R. C., Adjutant.

In accordance with these orders, the various schools for special instruction of medical officers were organized and conducted, with such changes as were necessitated by circumstances, throughout the life of the camp.

In addition to the professional instruction given in these special schools, the officers ordered to duty with the many units formed in the camp had to receive special instruction to fit them for active service with these units.⁷⁴

The special professional schools were given a definite stimulus when General Hospital No. 14 was placed under the command of the commandant of the camp, greatly enlarged, and reorganized as a teaching hospital. An excess staff composed of student officers was provided, and each clinical department of the hospital was under the direct control of the director of the school teaching

that specialty.⁶ The courses provided were not didactic, but entirely practical; and though the short time allotted was not sufficient to make specialists of the students, it permitted sufficient training to provide a body of excellent assistants in the different lines.

All units formed were kept fully officered, and vacancies were filled immediately by detail from the training companies. If they had not completed their basic course they were required to keep up with it until they had completed it. On account of their company duties not all of these officers could attend the lectures, but recitations were held for all in the different subjects.^{19 74}

Special courses were given by the several group commanders with the object of fitting these officers for active independent service. This instruction covered the administrative duties of company and hospital commanders and the administrative duties of their subordinates, the proper handling of enlisted men, and the methods to be used in the instruction of enlisted men.

A special class for the instruction of officers in the duties of a regimental surgeon was conducted at first in the hospital group and recruit camp. By this instruction it was intended to obtain a sufficient number of men specially qualified for this important duty.¹⁹ Later this method could not be pursued on account of the rapid transfer of student officers, only those receiving instruction in the special schools remaining sufficiently long to receive really worth-while instruction.⁶

SCHOOL OF MILITARY HYGIENE

The School of Military Hygiene was the first special school to be established at Camp Greenleaf,⁸⁸ and was organized early, with the idea that men trained along such lines would be necessary at once. Its object was the intensive training of medical officers in the field of camp sanitation.¹⁹

The curriculum was not laid down in its completed form at the start, but gradually developed as the school progressed. The basic course comprised didactic and practical instruction in the fundamental subjects of camp sites; drainage; disposal of kitchen, human, and animal wastes; policing of barracks and camps; water supply, including quality, quantity, and approved methods of purification; food, including mode of preparation, preservation, cleanliness of kitchens, and prevention of waste; insects; transmissible diseases and the methods of control. Practical field work was taken up and groups of students were assigned problems involving drainage, road construction, insect abatement, care of picket lines, construction and care of latrines, disposal of waste, kitchen inspection, construction and care of incinerators, and water purification and storage. Additional subjects covered dealt with pellagra, malarial fever, typhus fever, yellow fever, amebic dysentery, ankylostomiasis, vaccine therapy, causation factors in epidemics, special quarantine measures, flies and disease, rat proofing of buildings, first aid in sanitation, rural sanitation, sanitation in buildings, construction, building and disinfection, duties of a quartermaster's office, ship disinfection, operation of sewage disposal plants, ventilation, water purification, sanitary inspection, and mess management. These lectures were given by the instructors and also by such students as were qualified to lecture on such subjects.

The following is an outline of the course as developed:⁸⁹

DAILY SANITARY CLINICS

Theory of camp inspection.
 Theory of police duty.
 Care and construction of grease traps and incinerators.
 Care and construction of latrines, soak pits, and lavatories.
 Care of picket lines.
 Manure disposal.
 Fly and mosquito destruction.
 Septic tanks.
 Kitchen technique.

FIELD WORK (PROBLEMS ASSIGNED)

Drainage, ditching, subsoiling, use of blasting powder.
 Road building and grading.
 Inspection of heating, lighting, and ventilation of barracks.
 Map reading, contour sketching mounted and on foot, without use of instruments.
 Levels, with and without the use of instruments. Rat proofing, fumigation of buildings.
 Selection of stone and gravel, for building roads and filters, incinerators, etc. Plumbing, inspection; protection of plumbing against freezing.

Motor truck engines, care and use.

Nightly lectures on subjects that were germane to the sanitarian's duty. These lectures were given by members of the School of Hygiene, most of whom were specialists in their subjects.

Student officers were assigned daily to various organizations of this and surrounding camps to study camp sanitation.

LECTURES

Sept. 24..... Camp inspection.
 25..... Pellagra.
 26..... Malaria and mosquitoes.
 27..... Paper work in the Army.
 28..... Vaccine therapy.
 29..... Fleas.
 Oct. 1..... Rat proofing.
 2..... Customs of the service.
 3..... Rural sanitation.
 4..... Sanitary aspects of tuberculosis.
 5..... Hookworm.
 6..... Running a mess.
 8..... Duties of a quarantine officer.
 9..... Ship disinfection.
 10..... Military map making.
 11..... Amebic dysentery.
 12..... Refuse disposal.
 13..... Typhus in Serbia.
 16..... Kentucky privies.
 17..... Vitamines.
 17..... Military sketching (demonstration).
 18..... Amebic dysentery.
 20..... Carrel-Dakin methods.
 21..... Water purification.
 24..... Sanitary survey.
 24..... Food inspection.
 25..... Fatigue in trench life.
 26..... Yellow fever.

LECTURES—continued

Oct. 27..... Special quarantine measures.
 30..... Hygiene of ventilation.
 31..... Cerebrospinal meningitis.
 Nov. 1..... Sanitation and building construction.
 2..... Bubonic plague.
 3..... Military map reading.
 5..... Sanitary clinic.
 6..... Air sanitation.
 8..... Epidemiology.
 9..... Soils and drainage.
 12..... Common respiratory diseases in camp.
 13..... Treatment of contagious diseases without antiseptics.
 14..... Sanitation in the trenches.
 15..... Cerebrospinal meningitis.
 16..... Mosquitoes from an economic standpoint.
 17..... Yellow fever.
 20..... Operation of sewage disposal plants.
 21..... Rural sanitation.
 22..... Refuse disposal.
 23..... Sketch making.
 26..... Control of woodsheds.
 27..... Results of a sanitary survey.
 28..... Types of incinerators.
 29..... Height determination by slope board.
 30..... Practical leveling methods.

At first members of this school were required also to take the basic course, being excused only from military drill, but no student was assigned to the school until he had had at least two weeks drill with his company.¹⁹ Later this method was changed and each student was required to spend one month in the work of the basic course.⁸⁹ Recitations were held daily, and the students were carefully graded in their work.¹⁹

This school was discontinued in May, 1918, on account of the paucity of student officers available and was reopened in July.⁹⁰

The course covered a period of four weeks. If a student showed a lack of adaptability to this work, he was immediately returned to the basic course.^{19 91}

In the early days of the camp, Sanitary Company No. 1, which looked after all the sanitary work of the camp, was under the control of the director of the school.⁹²

The curriculum that finally developed and was found successful in imparting the greatest amount of such knowledge in the shortest possible time was divided into seven distinct heads:⁹¹

(a) Formal instruction by lectures and a specified course of reading. Rosenau's large textbook was used as the basis for reading, and an average of 50 pages was assigned daily. Each officer was required to make a written abstract of this work so that it was possible to ascertain that he had actually done the reading with fidelity and accuracy.

(b) Practical field work along special lines.

(c) Demonstrations of sanitary installments of military importance.

(d) Practical study, including the making of drawings of the more important sanitary appliances in the sanitary laboratory, together with a working knowledge of those of lesser importance.

(e) A short field course in map making and map drawing.

(f) The making of a sanitary survey of one entire section of the camp in the minutest detail, with a careful and comprehensive written report of the same.

(g) Oral quizzes were given by the individual instructors at frequent, but not specified, intervals on an average of three times a week. These were general and extended over a period of two hours. A formal written examination lasting, as a rule, about four hours, was given at the end of the second week, and a conjoint oral examination given by all the instructors together at the end of the third week. The written report of the final sanitary survey constituted the basis for a grade of the final week's work.

The course covered one month, and the student officer gave his entire time to this work, reporting at 7 o'clock in the morning and being dismissed at 5. The reading had to be done in the evening, as there was not sufficient time to finish it during the daytime. The reason for selecting a four weeks' course was that this seemed the longest period which should be spared at this particular time.

The practical field work along special lines was greatly emphasized. An idea of its scope may be obtained from the following summary: Each student was required to procure flies; to secure a suitable breeding chamber and to describe the different phases in the development of the fly, making notes and drawings of the various stages and developmental conditions. A careful study was made of the different breeding places of the fly and the different conditions under which they developed naturally. Several species of flies were studied, more particularly the common house fly, the bluebottle, and the biting stable fly. In the same way the mosquito was studied. The students were sent out

in groups to obtain mosquito larvæ, to determine the kind of mosquito from the larval form, and these were then put in suitable breeders and studied throughout the entire cycle of development. This was practicable with all except the last class, at which time it was too cold to carry on breeding experiments successfully. It is believed that in this way an actual practical knowledge of the life cycles of these two important insects was obtained which could not be obtained by either reading or lectures. Particular stress was laid upon finding the ova and larvæ of these insects in their natural habitats. The students followed the oiling squads for one whole day, thus becoming familiar with the methods of oiling pools and creeks.

A first-hand study of various sanitary installations of military importance was made under competent direction. An idea of the scope of this may be had by noting that visits were made to the city waterworks in Chattanooga and the entire system outlined and explained in detail by a sanitary engineer. In the same way several different chlorinating plants, the septic-tank disposal, and the bathing pool were carefully studied. Preceding the practical inspection of these, one or more lectures were given on the subjects and the students were thoroughly quizzed.

The field laboratory of sanitary appliances was made use of to the fullest degree. Each student was required to make careful drawings of 20 of the most important pieces of apparatus and to explain in detail the method of construction, the applicability, capacity, advantages, and disadvantages of each. Approximately, four half days were given to this work so that each officer who received this training should be in a position to intelligently handle a division or even larger unit as regards these matters. Special quizzes were held on the ground to ascertain the extent of their knowledge.

Four entire afternoons were given to practical instruction in map making and map drawing as well as in map reading. It is believed that this should be a part of every course of this nature if the student is not already familiar with it, since the reading of a contour map quickly and accurately is necessary to get an adequate grasp of the drainage of an area or the location for camp sites.

The fourth week of the course was devoted to making a sanitary survey. This sanitary survey was made with the utmost minuteness and served a triple purpose: First, it enabled the director to check up as to whether the student had examined and reported on every sanitary feature of the section in question. Second, this written report was immediately sent to the sanitary inspector of that particular district, and each point noted in the report was checked and commented upon by him and returned to the director who then personally investigated anything which required investigation, and sent a memorandum of these points to the commanding officer of the section. In this way it was possible to have a most minute inspection made once a month of the entire camp in addition to the regular inspections made by the director and his assistants. To insure that this written report was properly made, mimeographed directions were given each student.

The grading was based on a number of different features. Frequent oral quizzes were given at unexpected times and marks of these accurately

kept. The abstracts, the practical field work, the written examination, and the report of the sanitary surveys were given grade marks and from all of these the final grade was given the student.

Inasmuch as the mental attitude, adaptability, energy, and diplomacy count for a great deal in sanitary work, each student was given a rating along these lines and all of these grades together were used in basing the recommendation for assignment.

Starting with men who had had some sanitary experience—in other words, picked men—and giving them the basic course beforehand, in one month they could be given a very fair working knowledge of the subject provided they were of good average ability and were willing to work 12 to 14 hours daily. Each student had received at least one to two hours' practical instruction in sanitary inspections in the basic course before entering the advanced course. This course was very carefully planned, and it is believed that the course as outlined above is thoroughly sound and gives about as much as can be given in a month's time. It should be especially noted that the student's entire time was given to the subject and that he was not required to drill or to be present at retreat, etc., since in many cases the practical field work made it impossible to do this. The number of students should not exceed 20 or 25, since this course was designed in such a way as to require much personal teaching.

An outline for sanitary survey of Camp Greenleaf was made and given to each officer before he began his work. This outline was as follows:⁹¹

1. The territory assigned should be thoroughly studied on the map to obtain a general working knowledge of the terrain and buildings thereof.

2. The work should be mapped out systematically in such a way that no part can possibly escape.

3. The purposes of this survey are purely instructional, and to this end every point in regard to sanitation in the entire area should be accurately noted and commented on. In making this instructional survey, every point, whether good or bad, will be noted. For example, each and every mess hall, barracks, latrine, bathhouse, stable, storehouse, Young Men's Christian Association, and other civilian buildings will be inspected in every detail, and a notation of each detail will be made on the spot in the form of field notes. These field notes will be made according to a definite scheme, and the value of the survey will be estimated, in part, upon the sufficiency of this scheme. For example, in inspecting a mess hall, a note will be made of the conditions of the tables, floors, walls, kitchen utensils, serving tables, storerooms, presence of flies, and all other points which should properly be considered in the inspection of a mess hall. The handling of the food and the food itself will of course be noted. These field notes must be plainly legible and intelligently made out and must be handed in with the completed report.

4. A carefully made sketch of sufficient size to be intelligently read must be made of the territory, and on this the drainage shall be indicated and all sink holes, standing water, or low places where standing water might accumulate, together with the sufficiency or insufficiency of the ditching, must be noted. A comprehensive report as to possible improvements in drainage should accompany the report.

5. At least two inspections of the camp should be made in the evening and an accurate statement of the ventilation, especially in the civilian organizations and barracks should be made.

6. Inspection of the personnel: This should at least be carried to the point of noting accurately the cleanliness of all individuals connected with the serving of food.

7. A careful study of General Order No. 63 should precede the inspection, and wherever any part of this order is found not to be complied with, a specific note of the same should be made.

8. Test of a good sanitary report: A good sanitary report should enable the director to ascertain at once whether the storeroom of a given company in a given section is in proper condition; whether the drainage of a given area is adequate and if not, what is lacking; whether the Young Men's Christian Association in a certain section and the barracks are properly ventilated at night; whether the latrines are properly burned out or oiled; whether fly swatting in accordance with General Order No. 63 is being efficiently done; whether fly swatters and flytraps are present in proper numbers; whether mess kits are properly sterilized in accordance with general orders; whether handkerchiefs are properly sterilized; whether the amount of waste in a given company is excessive; whether the amount of food is sufficient and properly and cleanly prepared; whether sweeping is done and the floors scrubbed in accordance with orders; whether mosquitoes are present in any given stream, water barrel, etc. In short, the sanitary report is to cover every possible point which has any sanitary bearing. If the report fails to show any point of sanitation with a specific notation, not merely a general statement, it is in just that far inadequate and imperfect.

9. This sanitary inspection represents the test as to whether the student is capable of putting into practice what has been learned during the course in sanitation. Any student whose report is inadequate will not be recommended for sanitary assignment.

In connection with the instruction in this group, special mention should be made of the museum of sanitary apparatus completed under the direction of the camp sanitary officer. It consisted of 114 pieces of apparatus for field sanitation. Many of these were entirely new appliances, developed from a close study of existing apparatus and their deficiencies. This research feature, in addition to the museum's purpose of instruction, is worthy of special notice.⁹³ The purpose of this laboratory was twofold. First, it aimed to investigate the different forms of appliances for field sanitary use, to compare these with each other under different conditions, with a view to selecting those which best fulfilled their function, and also to standardize their construction, always bearing in mind that these appliances must be built from readily available materials. The second function was that of research in field sanitation, using the same methods as would be used in any laboratory whose work was of the same nature. It was desired to emphasize this function of the laboratory, since it had been productive of a number of new appliances, some of which were of entirely different design and principle from anything hitherto published. The justification of this research work is evident, when we consider that almost nothing of this sort had been done in this country, or, so far as can be learned, in any other country. Intensive work on the construction of the various forms of apparatus was begun during the latter week in July. Particular stress should be laid upon the fact that all were built without expert workmen, using only artisans found in the various companies. No special materials were available and a large proportion of the work was done with brick, wood, and such materials as could be found in the junk pile at the reclamation department.⁹³

SCHEDULE FOR FIRST COURSE IN SANITATION⁹¹

FIRST WEEK

Tuesday:

Starting of fly breeding; starting of mosquito breeding.

8 to 9 a. m.—Lecture ("Disposal of wastes in connection with flies." Major Williamson).

Field work—Demonstration of pertinent apparatus.

Reading—Rosenau: Preventive Medicine and Hygiene (Chap. IV, pp. 201–208 ("General considerations")); Chap. IV, pp. 208–218 ("Insecticides"); Chap. IV, pp. 247–261 ("Flies")).

General Order 63, Headquarters, Camp Greenleaf, XV and XVI.

Wednesday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Field disposal of urine, feces, and garbage." Major Williamson).

Field work—Demonstration of pertinent apparatus. Field study of ditching, oiling, spraying, and weed cutting.

Reading—Rosenau, as above (Chap. II, pp. 83–134 ("Diseases spread by alvine discharges")).

General Order 63, Headquarters Camp Greenleaf, XIII and XIV.

Thursday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Communicable intestinal diseases." Major Eggers).

Field work—Hookworm field work.

Reading—Rosenau, as above (Chap. IV, pp. 221–246 ("Mosquitoes")).

General Order 63, Headquarters Camp Greenleaf, XVII.

Friday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Hookworm and its management." Major Tenney).

Field work—Map work, with especial reference to sanitation.

Reading—Rosenau, as above (Chap. III, pp. 134–199 ("Diseases spread by respiratory discharges")).

General Order 63, Headquarters Camp Greenleaf, X.

Saturday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Mosquito-borne diseases." Major Tenney).

Field Work—Map work.

Reading—Rosenau, as above (Chap. IV, pp. 261–301 ("Miscellaneous parasites")).

Monday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Lice, fleas, and miscellaneous parasites, and diseases associated with them." Major Tenney).

Reading—"Munson on measles epidemic." *The Military Surgeon*, June, 1917, et seq.

SECOND WEEK

Tuesday:

Inspection of fly breeding; inspection of mosquito breeding.

8 to 9 a. m.—Lecture ("Clinical aspects of respiratory diseases." Major Williamson).

Field work—Map work.

Reading—"Communicable diseases at Fort Riley and Camp Funston." *The Military Surgeon*, July, 1918.

Wednesday:

Inspection of fly breeding; inspection of mosquito breeding.

Lecture—"Prevention of communicable respiratory diseases." Major Eggers).

Field work—Map work.

Reading—Rosenau, as above (Chap. VII, pp. 362–388 ("General considerations")).

Thursday:

Inspection of fly breeding; inspection of mosquito breeding.

Lecture—"Food diseases." Captain Wilmot).

Field work—Cooking devices, sanitary laboratory.

Reading—Rosenau, as above (Chap. XII, pp. 1099–1166 ("Disinfection")).

Friday:

Inspection of fly breeding; inspection of mosquito breeding.

Lecture—"Personal hygiene." Major Tenney).

Field work—Chlorination plant.

Reading—Ashburn, Ford, Lelean, on ("Personal hygiene").

Saturday:

Inspection of fly breeding; inspection of mosquito breeding.

Lecture—"Water supplies." Major Rich.

Field work—Inspection of water supply and water shed.

Reading—Rosenau (Chap. VI, pp. 789-821 ("General considerations")); pp. 866-878 ("Interpretation of water analysis"); pp. 878-953 ("Purification")).

Monday:

Examinations.

Reading—Rosenau, as above (Chap. IX, pp. 987-1033 ("Vital statistics")).

THIRD WEEK

Tuesday:

Lecture—"Sanitary survey of a small town." Captain Wilmot.)

Field work—Vital statistics.

Reading—Sanitary orders, in Ford's Administration. General study of General Order 63, Headquarters Camp Greenleaf.

Wednesday:

Lecture on the United States Public Health Service. Doctor Knight.

Field work—Lecture on the United States Public Health Service.

Reading—"Duties of sanitary inspection." Ford's Administration).

Thursday:

Lecture—"Relations of the laboratory to the sanitary inspector." Major Eggers).

Reading—Article on sanitation, to be selected by student and approved by instructor, and abstracted by former.

Field work—Time to be used to fill in any previous lapses in schedule.

Friday:

Lecture—"Duties of the sanitary inspector." Major Tenney).

Inspection of camp site and report on same.

Saturday:

Lecture—"Sewage disposal." Major Rich).

Remaining time to be used as on Wednesday, third week.

Monday: Demonstration of remaining sanitary appliances.

FOURTH WEEK

Entire week devoted to sanitary inspection of different sections of Camp Greenleaf.
Saturday: Final examination (oral).

SCHOOL FOR SANITARY ENGINEERS

The school for sanitary engineers, which was attached, as a subschool, to the School of Military Hygiene, was established in compliance with the following letter of instructions:⁹⁴

JANUARY 7, 1918.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: School for sanitary engineers, officers of the Sanitary Corps.

1. A school for sanitary engineer officers of the Sanitary Corps will be established as part of the general scheme of instruction carried out in the Medical Officers' Training Camp, Fort Oglethorpe, Ga.

The student officers are all to be sanitary engineers.

It is understood that many of them will later take charge of the divisional sanitary detachments, thereby requiring rather broad medico-military knowledge.

2. The purpose of this school is to conduct the training of those officers of the Sanitary Corps along military lines, from the military viewpoint, and in the military environment; and coincidentally to develop them physically and train them in subjects which they should know under the conditions under which they would practice their specialty including organization, regulations, paper work, applied hygiene and sanitation, handling of enlisted men, and general functions of officers.

3. About 20 graduate sanitary engineers of the Sanitary Corps are required monthly. Classes should be arranged on a basis of a course extending over not less than two months.

4. The senior instructor for this school detailed by this office on the staff of instructors of the training camp will, under the commandant thereof, be in direct charge of the course.

In addition to his educational duties, he will continuously investigate the qualifications and suitability for service of student officers under instruction.

5. As far as possible, any local problem of a sanitary nature will be utilized as part of the subjects of instruction.

6. The school for sanitary engineers will affiliate with the School of Applied Hygiene and Sanitation at your camp.

It will also, to the extent deemed desirable by you, affiliate with the school for laboratory men which it is proposed to establish at your camp.

7. The general professional instruction to be given will especially relate to all measures intended for the preservation of health of troops and their protection against disease.

Detailed information as to any special instruction desired on sanitary engineering, etc., will be furnished by the engineering division, this office.

8. The above course in general training and applied hygiene and sanitation will cover a minimum of two months.

9. Officers of the sanitary engineer division, Sanitary Corps, under training in this course will be organized as a special company, will be quartered and subsisted in the medical officers' training camp, and will be subjected to its discipline at all times.

10. Hours of instruction will be arranged by the commandant of the training camp.

11. The schedule for the first month is as follows:^a

* * * * * *

13. A number of enlisted men, to work under the division of field hygiene, will be kept at your camp under instruction therefor. The number will be later announced.

All should be given such part of the basic course for enlisted men at your camp as might be of advantage to them in such service. The scope of their special training in sanitation will be prescribed by you.

14. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON, *Colonel, Medical Corps.*

The sanitary engineering officers composing the School of Sanitary Engineering were relieved from duty with the School of Military Hygiene and transferred to the 7th Battalion, medical officers' training camp.⁹⁵ A large room in one of the officers' buildings near the battalion headquarters was assigned to the school as office and work and recitation room. The general program to which the engineer student officers conformed was as follows:⁹⁵ They lived in the student officer barracks, having a place in one of the companies, and took a full part in the regular barrack-room life. They took part in the morning drills and setting-up exercises. They attended the lectures and did the paper work of the basic course, excepting when the basic course work diverged too far from the field of sanitary engineering, when they were excused from this requirement by their instructors. They received special instruction in work directly related to the service of the sanitary engineer in Army camps. The special instruction in sanitary engineering, in general, occupied the afternoons and evenings. Its chief purpose was to focus the student's knowledge of practical sanitation upon the sanitary problems of camp life. For the accomplishment of this purpose it was necessary to spend a large amount of time in the field, but work in the field was always supplemented by conferences, readings, round-table discussions, quizzes, and the preparation of reports

^a See schedule, pp. 78, 79.

in quarters. Among the particular problems of camp sanitation which were covered in this way, the following may be listed as the most important:⁹⁵

Camp diseases, particularly those definitely related to the physical environment.—Causes, prevalence, and methods of prevention. The basic course lectures and quizzes in this subject were supplemented by readings and round-table discussions.

Camps and camp sites, general and sanitary requirements.—Topography, soil, exposure, area, arrangement; shelter, tentage, barracks, etc.

Camps and camp sites, improvement and control.—Drainage; mosquito extermination; fly control; ventilation, heating, plumbing, screening; sanitary inspections; policing.

Water supply.—Quantity required under different conditions; quality; purification, particularly by means available in field service; carriages and distribution.

Waste disposal.—Kitchen wastes—garbage and slops—burning, burial, feeding to swine, etc. Excretal wastes—sewerage and sewage disposal; latrines and trenches. Stable manure and litter. Camp rubbish.

A total of 110 officers received instruction in this school. The school closed December 17, 1918.⁹⁶

SCHOOL OF EPIDEMIOLOGY

The School of Epidemiology, which was intended to form part of the training in Medical Department sanitation, was established so shortly before the signing of the armistice that its accomplishments were necessarily very limited. All that need be recorded concerning it, therefore, is the program promulgated for its operation:⁹⁷

PLAN OF INSTRUCTION, SCHOOL OF EPIDEMIOLOGY

The training in the school was largely practical. In the first week practical instruction was given in making inspections for contagious diseases. Clinics and demonstrations on contagious diseases and their handling were held. Detailed schedule follows:

Hour	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
7 to 9	Inspection	Inspection	Inspection	Inspection	Inspection	Inspection	Inspection
9 to 11	Lecture: General plan of methods	Clinic: Measles, ward N, hospital	Clinic: Mumps, ward U, hospital	Clinic: Scarlet fever, etc., ward I, hospital	Review, quiz, office headquarters school	Conference, office headquarters school	
1.30 to 3	Inspection isolation camps, 15th Battalion, Company C	General conference, school headquarters	Demonstration of handling of contagious diseases in hospital ward I	Demonstrations, records, etc., school headquarters	General conference, school headquarters		
3 to 4.30	Inspection	Inspection	Inspection	Inspection	Inspection	Inspection	Inspection

At the end of the first week such officers as did not show evidence of adaptability to the work were dropped. Subsequent instruction was almost entirely practical and consisted of inspections for contagious diseases, demonstrations of the cases remaining in isolation

camp, with a consideration of the necessities of each camp and the method of solving camp problems, and assignment as assistant to the various camp directors. As fast as an officer qualified as assistant he replaced one of the officers in charge who might be then available for assignment.

Twice each week, on Tuesday and Friday afternoons, a general conference was held of all officers assigned to the school. At this conference practical problems arising in the various groups were brought up and discussed, informal lectures on various phases of the work were given, and such current literature as was pertinent to the school was reviewed.

The time necessary to train officers for assignment as epidemiologists varied, but on the average one month was necessary.

SCHOOL OF MILITARY MEDICINE

In 1918 two schools covering work which may be classified under this head were conducted. One was for the instruction of officers to be detailed later on cardiovascular boards and the other for the instruction of officers in lung examinations. They were separate and distinct and will be considered separately up to the time of their consolidation.⁹²

SCHOOL FOR EXAMINATION OF THE LUNGS

This was entirely clinical, and officers detailed to this course were given special instruction in the recognition of the different pathological lesions in the lungs.⁹⁸ This work was considered only as an adjunct to their basic course, and for some months no special time was allotted to these classes. In March, 1918, the number of students increased greatly, and more room for the classes at the hospital was required.⁹⁹ This school encountered the same difficulties that were present with all courses of instruction during the war, in that many officers had to be detailed elsewhere before completing the course.¹⁰⁰

THE CARDIOVASCULAR SCHOOL

This school was organized January 20, 1918, beginning with a small class obtained from among those in the student companies who were desirous of taking up this work, and who had sufficient professional qualifications to master it in the short time allowed. The course outlined at first was as follows:¹⁰¹

During the forenoon: Quizzes on anatomy, physiology, and diagnosis; examination of ambulant cases, under supervision of instructors; pathologic demonstrations and lectures; review of the newer literature.

Afternoon: Bedside instruction in the wards of the hospital.

Each student was assigned a patient and was required to make a complete general medical examination, including blood, urine, sputum, and, in appropriate cases, analysis of the spinal fluid, and determination of the intestinal flora.¹⁰² The first class consisted of only 12 students, but, by March 1 that number had increased to 27. As the course developed, instruction was given in the interpretation of the polygraph in normal and abnormal cases. The ward examinations were systematized, to provide for a most thorough and careful examination of each case under discussion. The Roentgenological study of chest lesions was covered in conjunction with the School of Military Roentgenology (q. v.).¹⁰¹

These two schools were combined in April, 1918, and became the School of Internal Medicine, which designation was later changed to the School of Military Medicine.¹⁰³

In the assignment of students to this school, the same methods followed in other schools obtained. Most of the students were taken from those reserved by the Surgeon General's Office for this class of work. After one month's military instruction, which was afterwards reduced to two weeks, the entire time of the student was devoted to his special training. Unfortunately, the demands of the service were so great that very few of these students were allowed to remain until the completion of the course. This greatly curtailed the usefulness of the school.

In July, 1918, the instruction at the school was widened to include instruction in general medicine and gastroenterology, in addition to the instruction in cardiovascular and lung diseases.¹⁰⁴

The work increased greatly during the last half of 1918, as may be seen from the numerical list of student officers for the month of September.¹⁰⁵

a. Total number in school during September.....	114
b. Total number carried over from August.....	32
c. Total number reported for instruction during September.....	82
d. Total number found, after preliminary work, not to be qualified.....	12
e. Total number ordered away while in course.....	9
f. Total number completing course during September.....	4
g. Total number carried over into October.....	89

During October, 1918, work in this school came to a standstill, owing to the occurrence of the severe influenza epidemic. All of the instructors and many student officers were made available for the treatment of the large number of patients, and many student officers were ordered to other camps for the same duty. The school was formally closed December 23, 1918.¹⁰⁶

SCHOOL OF MILITARY PSYCHOLOGY

The establishment of the School of Military Psychology was authorized by the Secretary of War in January, 1918, in reply to a letter from the Surgeon General to The Adjutant General, December 7, 1917, concerning the extension of psychological examining.¹⁰⁷ The constitution of the school was outlined in a letter from the Surgeon General to the commandant of Camp Greenleaf in January, 1918.¹⁰⁸

JANUARY 5, 1918.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: School in Military Psychology.

1. A school for military psychologists will be established, as a special course for selected student officers, as part of the general scheme of instruction carried out in the Medical Officers' Training Camp at Fort Oglethorpe, Ga.

2. The purpose of this school is to conduct training of psychologists along military lines, from the military viewpoint, and in the military environment; and coincidentally to develop its officers physically and train them in subjects which they should know under the conditions in which they would practice their specialty, including organization, regulations, paper work, relations with enlisted men, and their general functions as officers.

3. About 50 psychologists will be required monthly. Classes under instruction should be arranged for on the basis of a course lasting two months.

4. The senior instructor in psychology detailed by this office on the staff of instructors of the training camp will, under the supervision of the commandant thereof, be in direct charge of the course.

In addition to his educational duties, he will continuously investigate the qualifications and suitability of officers and enlisted men under general instruction relative to detail as psychologists.

5. The routine work of psychologists at your camp will, as far as possible, be demonstrated and utilized as part of the subjects of instruction.

6. The general instruction to be given will relate to the principles of psychological examination.

Detailed information as to the general nature and scope of the work to be done will be furnished by the psychology section of this office.

The course of instruction in psychology, based thereon, will be prescribed by the commandant of the training camp after conference with the instructor in psychology.

7. The course in general training and psychology will cover a minimum of two months. In addition to instruction in other subjects, the course in psychology will comprise a total of 167 hours.

8. Officers under training as specialists in military psychology will be quartered and subsisted in the medical officers' training camp and subject to its discipline at all times.

9. They will be organized as a special company. Hours of instruction in military psychology will be arranged by the commandant of the training camp.

10. The schedule for the first month is as follows: ^b

* * * * *

PSYCHOLOGICAL INSTRUCTION

	Hours
Organization and administration of psychological examination.....	6
Paper work, relating to psychological examining.....	6
Group examining, practice.....	10
Scoring, organization and methods, checking, filing, etc.....	12
Individual examining, practice.....	14
Statistical method.....	10

11. The schedule for the second month is as follows: ^b

* * * * *

12. About 25 to 50 selected enlisted men, to work under the division of psychology, will be kept at your camp under instruction therefor.

Some of them will be sent with a view to being tried out as to their fitness for appointment as officers of the Sanitary Corps under the division of psychology.

All should be given such part of the basic course for enlisted men, including the physical, military, and professional, as might be of advantage to them in their special service with psychologists.

Their further special training under the psychology division will be outlined by the representative of that division on your staff of instructors subject to your approval. They should be organized as a separate company under officers of the Sanitary Corps serving under the division of psychology.

13. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON, Colonel, Medical Corps.

The course was designed to cover, in a minimum of two months, 365 instruction hours.¹⁰⁹ It was provided that about 50 officers of the Sanitary Corps and 25 to 50 enlisted men, selected from psychologists already in service, or gained through voluntary inductions into the Medical Department, should be trained

^b See pp. 78, 79.

each month, until the authorized numbers should be secured. Provision was also made for the organization of psychologists into 2 companies, 1 commissioned and 1 enlisted. It was permitted that on the basis of abilities and qualities exhibited in training, about 50 men from the total enlisted group should be recommended for appointment as commissioned officers, 62 as sergeants, and 62 as corporals.

On February 4, 1918, officers and enlisted men detailed for instruction began to arrive. No barracks for the use of additional companies were at that time available, so that until a sufficient number of officers to form a company of 25 to 30 should arrive, commissioned psychologists were assigned to Companies 13, 14, 15, and 16, which were already formed of officers in the Medical Department. Similarly, until facilities and adequate personnel for the formation of a company of enlisted psychologists were obtained, these men were assigned to the Camp Greenleaf infirmary detachment. On February 8, 22 commissioned psychologists then in camp, together with certain other officers of the Sanitary and Veterinary Corps, were combined in Company 15. Until February 16, when the psychological officers of this company became Company 28, 7th Battalion, medical officers' training camp, and moved to a section of the camp where facilities for special training were available, commissioned psychologists received the same training as that given regularly to medical officers.¹⁰⁹

On March 7 the enlisted psychologists, then numbering 49, were moved from the infirmary to the tents of the recruit section of the division of hospitals and sanitary trains, 14th Battalion, and formed Company F of that battalion. In addition to their military training, special psychological training for these soldiers was begun at that time. On April 20 Company F became psychological Company No. 1, and, together with the commissioned psychologists of Company 28, was moved to more commodious quarters, formerly occupied by base and field hospitals. On June 20 a building specially constructed for psychological examining was completed and both groups of psychologists were consolidated and quartered, the officers in the psychological building itself and the enlisted men in the near-by barracks of the motor sanitary units in Camp Greenleaf annex. Formal instruction in military psychology was discontinued August 1, 1918.¹⁰⁹

The psychological instruction to be given in this school was outlined in a syllabus prepared under the direction of the Surgeon General:¹¹⁰

ORGANIZATION AND ADMINISTRATION OF PSYCHOLOGICAL EXAMINING

(First month, six hours; lectures by senior instructor)

First lecture: History of organization; general purposes; present official status; general relations to Medical Department and to psychiatric work; to personnel department; to line organizations.

Second lecture: Summary of previous camp work. General outline of system of examining in camp; the building; the course of examining. The alpha examination; the beta examination; the individual examinations. Method of calling and handling examinees. Scoring and reporting.

Third lecture: The psychological personnel and their tasks. Duty of the chief examiner; the assistant examiners; the clinical psychologists; the sergeants and corporals; the copy clerks; the orderlies. Efficiency records and weekly reports.

Fourth lecture: The alpha examination in detail. First trial and revision; the Washington revision. Reasons for changing particular tests. Results thus obtained in camps.

Fifth lecture: The beta examination in detail. Sources of material; purposes; general principles of construction and graduation. The individual examination in detail. Principles of formation, sources, results of application.

Sixth lecture: Model lecture for bringing out the main points to be emphasized in conferences with company and other commanders. Information which may and information which may not be given the general public.

PAPER WORK RELATING TO PSYCHOLOGICAL EXAMINING

(First month, 6 hours; lectures and problems)

This course is to be conducted in connection with the courses given all medical officers in paper work relating to the Medical Department and paper work relating to the Quartermaster's Department. It will relate to problems peculiar to the work in psychological examining such as channels, reports and correspondence, numbering and filing systems, use of the Scott rating scale, and memoranda, vouchers, transfers, etc. In practice students will be required to compose letters and memoranda, making reports, and filling out vouchers, etc., such as most frequently used in work of psychological examining.

GROUP EXAMINING PRACTICE

(First month, 10 hours; second month, 40 hours)

Students in military psychology, and other officers in training, will first be examined by instructors in order that the general character of the alpha examination shall become familiar to students. Thereafter, coaching and recitation in giving the alpha examination will be required of all students under criticism, as to voice, emphasis, technique of handling group, etc. Instruction and practice in giving and scoring the literacy test and the beta examination will follow. Students serve as examiners and as orderlies until complete uniformity is obtained.

SCORING ORGANIZATION AND METHODS

(First month, 12 hours; practice and conferences)

Systems of scoring previously used in the camps will be tried out and improvements attempted. Students will be required to hold, for a limited time, the following positions: In general charge, in charge of copying, of scoring, of table, and as clerk. Experimental determination of scoring system which shall accompany maximum of work and minimum of errors in a given time.

INDIVIDUAL EXAMINING PRACTICE

(First month, 14 hours; second month, 36 hours)

Under direction and with criticism, practice with the Stanford revision (complete form), abbreviated Stanford for illiterates, the point scale, the performance scales, the test for suspected psychotics. Qualitative types of response. Separate scores, variability. Scoring and report to medical officer.

STATISTICAL METHODS AND PRACTICE

(First month, 10 hours; second month, 10 hours)

Lectures, recitation, computations, and reports. Frequency distributions, tables, and graphs. The frequency surface and ogive. Measures of variability. The determination of percentile scores by smoothing the ogive. The absolute value of scores by the theorem of normal distribution. Correlation: Product-moments; rank differences; unlike signs. Labor-saving devices. Formulation, validation, graduation, and integration of new tests and test series.

The greater portion of the work will consist in actual computation and report upon assigned problems, using the material collected in the alpha, beta, and individual test series. Readings will be assigned in Rugg's *Statistical Methods Applied to Education*, and in Thorndike's *introduction to Mental and Social Measurements*.

MENTAL INCOMPETENTS

(Second month, 10 hours; lectures, reports, and, if feasible, clinics)

Lectures on insanity and feeble-mindedness by psychological instructors and medical authorities. Assigned readings in White's *Outlines of Psychiatry* and Tredgold's *Mental Deficiency*. Recitations as time permits.

SERVICE ORGANIZATIONS

(Second month, 2 hours; lectures to be arranged)

MALINGERING

(Second month, 6 hours; lectures and clinics, assigned readings, and reports)

Lectures by psychiatrists and by psychological instructors. Assigned readings in Jones and Llewellyn's *Malingering* and other works. Demonstrations of methods for the detection of malingering.

REPORTING RESULTS

(Second month, 2 hours; conferences)

Summary of previous methods and recommending system for future reporting.

The general instruction for commissioned officers was given chiefly by battalion and company commanders and by the corps of medical instructors of the medical officers' training camp.¹⁰⁹ Until the McLean auditorium was constructed the lecture courses were given in the annex of the Young Men's Christian Association near camp headquarters.

The general instruction for enlisted psychologists followed as closely as possible that given to the officers, save that in certain cases, such as *Army Regulations and Manual for the Medical Department*, abbreviations and substitutes were made and parts of Mason's *Handbook for the Sanitary Troops* were used as a text. This instruction was conducted by officers of the school.¹⁰⁹

The first lectures were given in a lecture room formed by throwing together rooms in former officers' quarters; later, mess halls, and still later, a lecturer's table in the open air, before an amphitheater under the trees, were used, until in June a special psychological building became available.¹⁰⁹ This building was located centrally in Camp Greenleaf, near the headquarters of the division of hospitals and sanitary trains. It was two stories, 120 by 30 feet. The lower floor at the eastern end of the building was a large room, with benches and lap wall boards for the use of about 200 men in the alpha group examination. At the opposite end of the building was a similar room, fitted with benches, tables, shelves, and special lighting arrangements for the beta group examination, for about 100 illiterates and foreigners. Between these two rooms was a hallway, with a drinking fountain and supply room, which was used also as a library and fitted with shelves and counter. Above the beta room was a well-lighted scoring room, provided with tables, chairs, and shelves and sufficiently large to accommodate 50 clerks and scorers. The remainder of the upper floor consisted of 5 rooms for individual examining, 2 offices, a record

room, a supply room, 2 lavatories, and 4 rooms which served as quarters for the commissioned examining staff. For use and instruction, necessary books, guides, blanks, office, and examining apparatus and materials were provided. Blackboards for the two large rooms were purchased from battalion and company funds.

Psychological training, outlined above, was supplemented in several ways.¹⁰⁹ A course of four lectures on the political and religious creeds commonly held by conscientious objectors was given. Upon three occasions, lectures were given by personnel officers and supervisors, and practical experience in personnel interviewing was secured by student officers and men at recruit depot, Fort Oglethorpe, and at Camp Forrest. Special lectures on the psychological aspects of reconstruction were given by officers from the reconstruction division of the Surgeon General's Office. Considerable practical experience in actual examining, both of groups and of individuals, was also given to students. The instructor in psychology twice had the opportunity of giving general lectures on the nature and purpose of psychological examining to the medical student officers, as a part of their scheduled instruction. Psychological instruction was conducted almost exclusively by officers of the school.

The lectures on organization and administration of psychological examining covered the following subtopics: History; purposes and official status of the work; relations to Medical Department (especially to neuropsychiatry); relations to personnel work; relation to line organizations; summary of camp results; outline of system of examining; scoring; filing; reporting; camp psychological personnel and their duties; construction, revision, and results of the alpha, beta, and performance scale examinations.¹⁰⁹ The course in paper work relating to psychological examining consisted of lectures on the form of letters, indorsements, memoranda, telegrams, and psychological reports, on rules as to channels, titles, expressions, and as to the making of vouchers, receipts, and other papers relating to supplies. Practical problems relating to paper work were set and their solutions criticized. Moss's Army Paper Work was used as a partial text.

In the alpha examining practice, the student, after taking the examination, scoring papers, listening several times to the examination as given by a practiced examiner, and in some cases repeating it in unison with the group, was required to give the examination individually under criticism. When uniformity and accuracy in voice, emphasis, and speed were obtained, students were given practice with groups in actual examination, in order to perfect technique.

The practice in beta examining was similarly conducted. Students acted at various times as examiner and as chief orderly, until precision and uniformity of action and gesture were secured.

Lectures and practical demonstrations of the organization and methods of scoring group examinations were given. Methods to secure accuracy and speed of scoring were specially emphasized. Students were required to score papers during a period long enough to make all details of scoring and grading perfectly familiar.

Practice in individual examining consisted in lectures, study, and recitations on the structure and rules of the Yerkes-Bridges point scale, the Stanford-

Binet age scale, and the performance scale examinations. Students were required to write out brief "pocket rules" for giving and scoring the tests. When the general nature, principles, and detailed rules of the examinations were clearly in mind, students were grouped in pairs each member of which gave his partner the examinations. Long practice in accurate scoring and regarding actual papers, discussions of typical cases of "border-line" intelligence, of foreigners and illiterates, of the feeble-minded, of the insane, and of malingerers, interpretation of "scatter" and of atypical reactions, and of the basis of recommendations as dependent upon mental age, educational status, personal, family, economic, and social history, were made features of the instruction before tests on actual cases were made.

The courses in statistical method comprised, in part, five or more lectures on graphic representations, measurement of central tendencies and of variability, and of correlations and their interpretation. The greater part of the work, however, consisted in practical computations based on data collected in the camp. Assigned readings were made in Rugg's Statistical Methods and in Thorndike's Mental and Social Measurements. In connection with the course in statistics, data bearing on the revision and improvement of methods, the assignment of grades, and the equalization of scores on various scales were obtained and reported to the division of psychology of the Surgeon General's Office.

The courses in mental incompetency and in malingering were given in close connection with that on individual examining. In the former course, the lectures were supplemented by readings in Tredgold's Mental Deficiency and in White's Outlines of Psychiatry, and in the latter course, by Jones and Llewellyn's Malingering. In both, however, references were continually made to actual cases handled by the lectures, in order to make concrete the generalizations and typical pictures.

The following is a typical daily program of instruction:¹⁰⁹

5:45 a. m.	First call.
6 a. m.	Reveille.
6.30 a. m.	Mess.
7 to 9.15 a. m.	Setting-up exercises and drill.
9.30 to 11.30 a. m.	Military lectures (commissioned group). Psychological lectures (enlisted group).
12 m.	Mess.
1 to 2 p. m.	Quiz (commissioned group). Military lectures (enlisted group).
2 to 4.	Psychological lectures or practice, or drill (enlisted group).
5.	Retreat.
5.30.	Mess.
6 to 7.	Study (commissioned group). Singing and quiz (enlisted group).
9.30.	Taps.

Inspection and military or psychological lectures composed the program for Saturday mornings.

Psychologists upon arrival in camp were given alpha examination and filled out a modified officer's qualification card. On this card were listed student's topics of specialization and publication and their amount and variety of psychological and applied psychological training, as well as their preferences as to psychological duties. Their abilities in the practice courses were continually

estimated and recorded by the instructors in charge; the officers' military grades were reported weekly by the company commander to the battalion commander, who revised them. In lecture courses, grades were determined by recitations and final examinations. Recommendations as to promotion and assignment of commissioned psychologists were made by a board of examiners.

For enlisted men, the data on the qualification cards, the report of the company commander as to military records, and the marks obtained in the training course were similarly secured. A written examination on general psychological topics and an oral examination furnished a further basis of recommendation by a board composed of officers of the school.

During the period in which formal instruction was given in the school, psychological examinations were made and reports were submitted on the various activities.¹⁰⁹

In July, 1918, it was directed that early examination of all organizations in Camp Greenleaf be made.¹⁰⁹

A complete critical and constructive report on the revision of the psychological examinations and examiner's guide, as well as 10 special reports dealing with psychological methods, the equation of grades on various scales, and the examination of conscientious objectors were made from this school.¹⁰⁹

Sixty-eight officers and two hundred and twenty-six enlisted men received instruction in this school.¹⁰⁹

In the period from August 7, 1918, to October 1, 1918, very little instructional work was undertaken, as the entire time was occupied with the examination of incoming drafts, the preparation of distributions, and the summarizing of examinations.¹¹¹ Although no special classes were held, much practical instruction in group and individual examining and scoring was given, incident to the examining. The number of men in the school was small. From October 1 to 13, the influenza epidemic was at its height in this camp. As the psychology building was used as an infirmary for influenza suspects, hardly any examinations were given. Instruction was also necessarily limited. From October 14 to November 9 definite classes in psychological examining were held as a considerable number of enlisted men and officers had reported for the new school of psychology. Instruction during that period was given in lectures as follows:¹¹¹ (a) Organization and administration of psychological examining; (b) statistics; (c) group examining practice; (d) scoring filing; individual examining, lectures, and practice. During this period numerous psychological examinations were given, particularly at Camp Forrest. In the week from November 11 to 16 a course of instruction on personnel work, taking the entire time of the men for three days, was given by The Adjutant General's Department, committee on classification of personnel. In the evening an officer from the Surgeon General's Office gave lectures on reconstruction and reeducational work. The remainder of the week was spent in practice in personnel work (interview, tabbing, etc.). From November 16 to December 7 instruction was given in reconstruction work and individual examining, the mimeographed revised Manual for the Medical Department, chapter 2, "Military hospital organization and administration," being used as the basis of instruction. Other reconstruction literature and the circular "Army Mental

Tests" were also studied. The entire week of December 9 to 14 was spent in a special course in trade testing. The instruction consisted of lectures on oral and picture tests, together with examining practice. During the two weeks from December 16 to 28 the time was chiefly spent in athletic exercise and drill. Several lectures on deception tests were given and some experiments tried.

On December 30 and 31 orders were issued from headquarters, Camp Greenleaf, demobilizing practically all of Camp Greenleaf. The psychological detachment was included in these orders, and in the period from December 31, 1918, to January 9, 1919, practically all the men were discharged or transferred for discharge, thus bringing the school to a close. Twenty-one officers and fifty-five enlisted men attended this second school.¹¹¹

SCHOOL OF MILITARY ORTHOPEDIC SURGERY

The first step in the development of the School of Military Orthopedic Surgery was the inauguration, in the early days of the camp, November, 1917, of the School of Applied Surgical Mechanics, the purpose of which was to teach as many officers as possible the principles of the care of gunshot wounds and the splinting of fractures in the military service.^{19 c} Most of the students who attended the school at its inception were officers reserved for orthopedic service and those detailed for duty with evacuation hospitals.⁹² In this school a great deal of work in the preparation of mechanical appliances was done, and a large number of plaster and gelatin casts of different parts of the body, to illustrate military surgical work, were made. These casts formed the nucleus of a museum of casts to be used in the teaching of military surgery.^{95 112}

Another phase of orthopedic work was covered in the School for Care of Feet, in which were taught elementary orthopedics, including the fitting of shoes and the treatment of minor injuries of the foot.^{8 113} This school also conducted a gymnastic course for the reclamation of men who otherwise would have been discharged on account of flat foot. All student officers were required to attend this course.¹¹³

In December, 1917, the Surgeon General outlined a plan for the organization of the School of Military Orthopedics.¹¹⁴ In accordance with these instructions, the two schools already in operation were combined with a new course in didactic and clinical work, thus forming the School of Military Orthopedic Surgery,¹¹⁵ which continued to operate as such until December 24, 1918.¹¹⁶ The work of the newly organized school fell under three categories:^{113 115 117 118}

Course A.—The soldier's foot. To teach the care of the feet, shoe fitting, normal anatomy, and the common deformities of the soldier's foot.

Course B.—Applied mechanics. To teach the mechanics of fracture dressings and appliances.

Course C.—Didactic and clinical. To conduct the didactic and clinical work of the school.

Student officers taking the first two courses were also in the basic course of the camp, but when they advanced to the third course their time was devoted exclusively to professional work.^{113 118}

This professional work was outlined as follows:¹¹⁹

* This school afterwards became part of the School of Military Surgery (q. v.).

1. Subjects taught:

- (a) Anatomy (30 hours).
- (b) Pathology of bones (6 hours).
- (c) Orthopedic surgery, didactic (24 hours).
- (d) Orthopedic surgery, clinical (48 hours).
- (e) Fractures (6 hours).
- (f) Minor foot ailments in military service (6 hours).
- (g) Carrel-Dakin method (3 hours).
- (h) Military hospital (6 hours).
- (i) Ligations and amputations (3 hours).
- (j) Nerve surgery (3 hours).
- (k) X ray (6 hours).
- (l) Neurology (3 hours).
- (m) "Literature Club" class (44 hours).

This consisted of the preparation of abstracts of the recent orthopedic bone and joint literature, their presentation to the class, and discussion thereon.

2. Objects of course: In the absence of definite instructions the director of the course had the following objects in mind:

- (a) The making of intelligent orthopedic assistants.
- (b) Giving a thorough groundwork for future training in orthopedic surgery.
- (c) Turning out medical officers sufficiently well equipped to become orthopedists in various types of field hospitals and, in some instances, base hospitals.

3. Duration of course, four weeks.

4. Total number of hours in course, 188.

This school continued in a rather unsatisfactory way until July, 1918, when it was reorganized and placed on a better footing. During this time small classes ranging from 15 to 25 officers took the course.^{120 121 122 123} After the reorganization instruction was given to officers reserved for orthopedic surgery and other officers desirous of taking this course. Before being assigned to the orthopedic school each officer must have completed at least two weeks basic instruction, though at first one month's basic course was prescribed.^{118 6}

The following letter from the Surgeon General's Office outlined the policy to be followed with the officers assigned to this school:¹²⁴

JULY 12, 1918.

From: The Surgeon General, United States Army.

To: The Commandant, Medical Officers' Training Camp, Camp Greenleaf, Ga.

Subject: Student officers' division of orthopedic surgery.

1. In order to prevent confusion and to expedite the handling of orthopedic personnel, the following procedure is recommended:

I. Student officers will be assigned to the camp in the usual way, in order that they may receive military training prior to assignment to special courses. This training should preferably be four weeks or longer.

II. Lists of student officers so ordered will be forwarded by this office to the commandant, and a second list forwarded the director of the School of Orthopedic Surgery, through the commandant. These lists will go forward as separate inclosures in order to lessen the chance of loss.

III. The personnel for special courses in orthopedic surgery will be chosen by the commandant and the list of available men should be forwarded to this office on the 15th of each month; the assignment being effective the 1st of the following month.

IV. Orders for the removal of personnel from training camp will not ordinarily be requested by this office until information is obtained by telegraph or letter from the commandant regarding advisability of the same.

V. The director of the School of Orthopedic Surgery should report on the individuals of the special courses, on the forms provided, and these reports should reach this office not

later than the 20th of the month. It is understood that these reports will necessarily not be complete but will give this office some data which, taken in connection with the report from the examining board, will facilitate distribution of the personnel.

VI. It is suggested that the director of the School of Orthopedies be given a copy of this letter and that he be empowered to communicate with this office, through channels, in regard to personnel on duty at the above-named camp.

VII. It is suggested that the director of the School of Orthopedic Surgery prepare a card index covering the men in the various phases of training who are assigned to the above-named camp and reserved for the division of orthopedic surgery.

By direction of the Surgeon General:

DAVID SILVER,
Lieutenant Colonel, Medical Corps, N. A.

The first class received the following instruction:¹²²

	Hours
Shop work.....	30
Anatomy.....	10
Lectures—didactic and clinical; quizzes and discussion of abstracts from orthopedic publications.....	10
Pathology.....	5
X ray.....	5

This allotment of hours was only tentative and is included to show the relative amount of instruction given in each division of the subject.

The instruction was divided into three parts:¹²⁵ (1) A practical course for all officers in the medical officers' training camp. (2) A similar but slightly less technical course given to 4 per cent of all the medical enlisted personnel. (3) A special course for medical officers who were assigned to the orthopedic division. The general course for the medical officers' training camp included lectures on the normal foot, with special reference to weight bearing and joint function; foot defects, including flat foot, weak foot, hallux valgus, hallux rigidus, hammertoe, bunion, etc., foot strain and its best treatment; the prevention and treatment of minor foot ailments and injuries, such as corns, calluses, blisters, etc., and the fitting and care of shoes. The second part of this course was special instruction in the use and application of splints used in the Army, and drills for the purpose of making enlisted men proficient in the rapid application of such splints as are used for the transportation of the wounded. The third division of instruction comprised lectures on the disabilities of joints.

Four per cent of all enlisted men passing through this camp received a similar course of orthopedic instruction, with the exception of the lectures on joints.¹²⁵

The special course for officers assigned to the orthopedic division was of four weeks' duration and comprised didactic and clinical instruction in all branches of orthopedic surgery useful in the Army. Special effort was put forth to make the work practical and to eliminate everything which was unnecessary from the military standpoint.¹²⁵ The work of the four weeks' course was apportioned as follows:¹²⁶

During the first two weeks of the special school, a course in anatomy of the bones, joints, and muscles, particularly of the extremities, with the nerve and blood supply, was given. The latter part of this time was occupied with the actual performance upon the cadaver of the more common operations in this branch of surgery. The course was given in the school of anatomy.

During the third week, each morning was spent in the orthopedic shop in the basement of ward R, where a course was given in the manufacture of the standard Army splints, seven in number. The officers were taught welding, brazing, forging, and leather work so that they could make any apparatus ordinarily required. The manufacture and application of plaster of Paris splints was taught to sections of the class during the third and fourth weeks, in connection with the shop work, as the plaster room was too small to accommodate all of the class at once.

In the afternoons of the third and fourth weeks, clinical demonstrations of cases from the wards and out-patient department were held twice or three times a week. Didactic lectures were given by the staff on orthopedic subjects, such as injuries and diseases of the bones, joints, muscles, tendons, and nerves. The soldier's foot and the military shoe were carefully considered. Four hours were devoted to work in the school of military Roentgenology, interpretation of plates being especially studied. The classes attended the lectures in the school of military surgery, on the use of the Carrel-Dakin method and the use of dichloramine-T. Experts from the neurosurgical school gave two lectures on peripheral nerve injuries and paralysis. The ward surgeon gave a demonstration of ward administration and paper work. The practical use of the standard splints and the Thomas splint drill were taught. A course in pathology, occupying the last hour of each day, was given by the laboratory school, and was attended by both the surgical and the orthopedic classes.

A new class was started every two weeks, so that while the old class was having its didactic and clinical work at ward R, the new class was in the dissecting room at Chattanooga.¹²⁶ It was found that, as a rule, the members of the classes needed the most elementary instruction in anatomy, and in consequence the work in the dissecting room was of the highest importance. The weekly programs were made out in advance in consultation with the adjutant of the school of military surgery, and some of the lectures and demonstrations in both divisions were attended by both the orthopedic and the surgical classes. The Medical War Manual No. 4 was used as the standard textbook. The shop instruction for the four weeks' course covered the following work:¹²⁷

First week.—Instruction in the principles of mechanical drawing and in the interpretation and making of such drawings, each man during this period making working drawings of the skeleton hyperextension splint (crab splint) No. 714 and of the combined leg and ankle splint No. 707.

Second and third weeks.—Men were instructed in shop practice and in the simpler metal-working operations, such as laying out, cutting, bending, forming, drilling, riveting, brazing, finishing, etc.

During this period each man made one of the following splints:

Skeleton hyperextension splint (crab splint), No. 714.

Combined leg and ankle splint, No. 707.

Thomas knee splint, No. 703 B.

In the case of several of the more apt men they also each made a hyperextension hand splint (cock-up), No. 713.

Fourth week.—During this period the time was devoted to plaster work. Instruction was given in the materials used and their properties, equipment necessary, preparation of bandages and their care, and in the technique of plaster application and use of apparatus.

Each man applied the following dressings: Straight cock-up splint of wrist, coaptation splint of arm, neutral elbow splint, neutral ankle splint, bracketed splint of leg.

Each two men applied: One of the various plaster jackets, spica of hip, humerus abduction dressing.

The following schedules outline in detail the instruction given in the entire four weeks' course in this school.¹²⁸

FIRST WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 a. m.	Holiday	Postures and deformities	Pathology	Pathology	Pathology	9 to 11.30 a. m. Foot and shoes
10 to 11.30 a. m.	Holiday	Standard splints	Standard splints	Standard splints	Standard splints	As above
11.30 a. m. to 1 p. m.	Lunch					
1 to 2 p. m.	Holiday	Trench foot	Quiz on splint drill	Septic arthritis, knee	Pott's fracture	Half holiday
2 to 3 p. m.	Holiday	X ray	Tuberculous joints	X ray	Peripheral nerve surgery	Half holiday
3 to 4 p. m.	Holiday		Back conditions	Osteomyelitis	Quiz	Half holiday

SECOND WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 a. m.	Pathology	Pathology	Pathology	Pathology	Pathology	Feet and shoes
10 to 11.30 a.m.	Standard splints	Quiz	Examination in the draft	Quiz	Quiz	
Lunch						
1 to 2 p. m.	Shopwork and plasterwork	Shopwork and plasterwork	Shopwork and plasterwork	Shopwork and plasterwork	Shopwork and plasterwork	Half holiday
2 to 3 p. m.		X ray		X ray		Half holiday
3 to 4 p. m.		Shopwork and plasterwork		Shopwork and plasterwork	Shopwork and plasterwork	Tuberculous joints

THIRD WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 a. m.	Shopwork and plasterwork			Anatomy, at University of Chattanooga		
10 to 11.30 a. m.	Shopwork and plasterwork			Anatomy, at University of Chattanooga		
Lunch						
1 to 2 p. m.	Clinic	Pathology	Pathology	Anatomy, at University of Chattanooga		Half holiday
2 to 3 p. m.	Arthritis	X ray	Joint lesions	Anatomy, at University of Chattanooga		Half holiday
3 to 4 p. m.	Pathology	Clinic	Differential diagnosis	Anatomy, at University of Chattanooga		Half holiday

FOURTH WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 a. m.	Anatomy, at University of Chattanooga			Shop and plaster work		
	Lunch					
1 to 2 p. m.	Anatomy, at University of Chattanooga			Pathology		Half holiday
2 to 3 p. m.						Half holiday
3 to 4 p. m.				Development battalion work	Draft exami- nations	Half holiday

The school was originally quartered in ward R of General Hospital No. 14, which was one half of a two-company barrack in the post of Fort Oglethorpe. In October, 1918, the space was found inadequate and the other half of the building, ward Q, was assigned to the school. Ward R was used exclusively for classrooms and shops, and ward Q was used for the treatment of all orthopedic cases in this hospital and also was the out-patient department.¹²⁹

The school closed December 24, 1918.¹¹⁶

SCHOOL OF MILITARY SURGERY

Prior to August, 1918, the only instruction given in general surgery was that included in the work of the School of Applied Surgical Mechanics.¹⁹ From the standpoint of general surgery this did not prove altogether satisfactory,¹³⁰ and on August 14, 1918, the School of Applied Surgical Mechanics was developed into the School of Military Surgery.¹³¹ The school thus organized completed its work and was closed December 24, 1918.¹³¹

All officers reserved for surgery by the Surgeon General's Office were required to take this course, after two weeks in the regular basic course.⁶ Even after work was started in the school the students were required to take military instruction until 9 a. m. and be present at retreat. The professional work was planned so as to minimize the didactic and accentuate the clinical and manual instruction.¹³² The hours devoted to instruction were 9 a. m. to 12 noon, and 1 to 4 p. m., except Saturday, when a half holiday was given.¹³³ A study hour from 7 to 8 p. m. was also adopted. A student instructor was in charge during the study hour, and absolute quiet was maintained. From 8 to 8.15 p. m. a quiz was held.

After the armistice the general plan of the course was changed. Formerly, the surgery of acute and general traumatic conditions was taught, but later special emphasis was laid upon the surgery of convalescent and chronic types of cases, with the idea of preparing the student to care for the large number of such cases soon to arrive from overseas.¹³⁴

A total of 701 officers received instruction in this school.¹³¹

After completion of the course the students were classified as follows:¹³¹ AA, Exceptionally good surgeons capable of high-class surgery and executive work; A, surgeons capable of conducting operating teams; B, surgeons capable of doing regular routine surgery, as hernias, appendectomies, etc.; C, qualified assistants; D, good ward men.

Any officers found not capable of qualifying in any of the five groups were ordered back to the basic course, and recommendation was made to the Surgeon General's Office to remove their names from the reserved list.¹³¹

The course as outlined covered the following subjects:¹³¹

Surgical anatomy.

Operative work on the cadaver.

Surgical pathology, particularly the reaction to trauma and infection.

Applied anatomy—operative work on the dog.

Trauma and infections of the urogenital tract from the military standpoint. (This was given to the first class.)

Trauma and infections of the eye and its appendages.

Ophthalmoscopic examinations—every man, in sections.

Trauma and infections of the ear, throat, and nose.

Otoscope examinations—every man, in sections.

Fractures, splints, traction, plaster of Paris.

Application of standard Army splints. Every man was required to apply the Thomas splints to other men in the class.

Shock, hemorrhage.

Operative technique.

Trauma of the cranium. (This was only given to the first class.)

Trauma of the face, jaws, and teeth. (This was eliminated from the later instruction.)

Ward technique:

Carrel-Dakin technique.

(a) Setting up of apparatus.

(b) Titration—every man in class.

(c) Application to patient.

Dichloramine-T technique. Dressing of patients.

Bacteriological control of infections.

Needling and transfusion. Every man in class; demonstration on each other.

Laboratory technique as applied to surgery:

Blood pressure.

Acidosis.

Application and interpretation of the flouroscope and X rays.

The disabling foot.

The disabling knee.

The disabling back.

Trauma of the chest.

Trauma of the abdomen.

The surgical complications of pneumonia.

Trench foot.

Gas gangrene.

Burns.

The acute abdomen.

The follow on to complete recovery.

Practical work:

The application of the regular splints, with special reference to the Thomas splints.

Every man applied this splint to other men in the section.

Needling of veins.

Blood typing.

Carrel-Dakin solution titration.

Dichloramine-T dressings.

Assignment to wards in the hospital.

The following schedule of professional work shows the course followed by this school:¹³⁵

Professional school
FIRST WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
8 to 9	Surgery: Mechanics and symptomatology of trauma	Surgery: Basic principles on which surgical procedures must be based	Surgery: Hemorrhage, shock	Surgery: Infections and their control	Surgery: Infections and their control	Surgery: Trauma of skin and underlying soft parts
9 to 10	Pathology: Natural history of disease inflammation	Urology: Lesions of the penis; tumors of scrotum	Pathology: Specific infections	Urology: Specific and non-specific infections of the urethra	Pathology: Repair of wounds	Urology: Affections of the urethra and bladder; retention
10 to 12	Practical demonstrations will be given every day. The students will be divided into groups. These student groups will receive 4 hours' instruction in each subject on 2 successive days. (See demonstration schedules)					Orthopedics, basic principles; neurology
1.30 to 2.30	Medicine: Infectious diseases	Medicine: Infectious diseases	Medicine: Infectious diseases	Medicine: Diseases of digestive system	Medicine: Diseases of digestive system	Medicine: Duty of the medical officer in handling the sick
2.30 to 3.30	Otolaryngology: Affections of nose, throat, and ear in war	X ray: Cooperation between the Roentgenologists and the medical officer	Otolaryngology: Acute affections of the nose and throat	X ray: Uses and limitations of X ray in war	Otolaryngology: Acute affections of the ear and mastoid	Laboratory: Lecture and demonstration
3.30 to 4.30	Quiz	Quiz	Quiz	Quiz	Quiz	
	Study	Study	Study	Study	Study	

SECOND WEEK

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
8 to 9	Surgery: Trauma of skin and underlying soft parts	Surgery: Trauma of bones and joints	Surgery: Trauma of bones and joints	Surgery: Trauma of thorax and contents	Surgery: Trauma of abdomen and contents	Surgery: The acute abdomen
9 to 10	Surgery: Injuries of the head and neck; concussion and compression	Urology: Affections of the prostate and seminal vesicles	Ophthalmology: Injuries of the eye	Urology: Affections of the ureters and kidneys	Burns	Urology: Syphilis
10 to 12	Practical demonstrations will be given every day. The students will be divided into groups. These student groups will receive 4 hours instruction in each subject on 2 successive days. (See demonstration schedule)					Orthopedics: Care of feet in the field and trench foot. Urology
1.30 to 2.30	Medicine: Physical examination of the lungs	Medicine: Acute diseases of the lungs	Medicine: Chronic diseases of the lungs	Medicine: Physical examination of the cardiovascular system	Medicine: Common diseases of the cardiovascular system	Medicine: Duty of medical officer in handling cardiovascular system
2.30 to 3.30	Orthopedics: Foot deformities	Laboratory: The laboratory service in the army	Orthopedics: Foot deformities, disabilities, and shoes	Surgery: Gas gangrene	Orthopedics: Derangements and disabilities of joints	Laboratory: Lecture or practical demonstration
3.30 to 4.30	Quiz	Quiz	Quiz	Quiz	Quiz	
	Study	Study	Study	Study	Study	

SCHOOL OF NEUROSURGERY

The School of Neurosurgery was organized May 9, 1918.¹³⁶ Lectures and clinics were held in the classroom set apart for this work and in the wards of General Hospital No 14, Fort Oglethorpe. Selected medical officers sent to Camp Greenleaf for training were given full-time military training for 30 days, after which they were assigned to the school for instruction. By special arrangement the military training during the 30-day period stopped at 2 p. m., and from 2 to 5 p. m. the student officers received instruction in this school. From 6 to 8 p. m. dissections, post-mortems, quizzes, and reviews of current literature were held. All student officers assigned to Camp Greenleaf who had received any neurosurgical experience were examined by the director of the school, and those found qualified for this instruction were assigned to the school.

The instruction consisted of didactic lectures covering the anatomy, physiology, and pathology of the brain, spinal cord, and peripheral nerves; treatment of cerebral traumatism, infections, etc., clinical instruction in which all suitable clinical material from General Hospital No. 14 was utilized in the demonstration of nervous diseases. This work was divided as follows:¹³⁷

Lectures:

- 10 hours. Physiological anatomy of brain, spinal cord and cranial nerves, with regional diagnosis.
- 14 hours. Gunshot injuries and traumatism of the same with diagnosis, pathology, and the indications for treatment, technique, etc.
- 9 hours. Peripheral nerves, diagnostic syndromes, anatomy, and indications for treatment.
- 20 hours. Lectures and clinics on functional and organic nervous diseases.
- 8 hours. Pathology of meningitis, tumors, syphilis, wound repair, ductless glands.
- 8 hours. Eye, ear, nose, and throat in relation to intracranial lesions and diagnosis.

Laboratory instruction:

- 16 hours. Bacterial counts, blood and spinal fluid examinations, post-mortem examinations, removal and preservation of specimens.
- 6 hours. General quizzing.

X-ray demonstration:

- 4 hours. Interpretation of plates, fractures, brain tumors, foreign bodies, etc.

In July, 1918, the school was temporarily discontinued following the departure of the officers in charge to overseas duty.¹³⁸ The section of brain surgery arranged to continue the school along the lines established by this officer, but his successor, after several months of observation of the conditions at Camp Greenleaf, officially advised against the reorganization of the school. His report embodied the suggestion that it was not possible to conduct such a school at Greenleaf. This was not approved by the director of the surgical services at General Hospital No. 14, and this disapproval was concurred in by the Surgeon General. It became apparent to the section of brain surgery in September that the available neurosurgical personnel would be insufficient to meet the requirements of the Army if, as it then seemed likely, the war should continue until the spring of 1919. It was believed that the only available source of further personnel for the section was the Medical Officers' Training Camp, Camp Greenleaf, where the majority of the members of the Medical Corps entered strictly military service. Such student medical officers, after military instruction for two weeks in the basic course, were generally assigned to the special schools in the camp for courses of professional instruction.

The reorganized school opened November 12, 1918.¹³⁹ Quarters were provided for the school in the building occupied by the School of Military Surgery. The schools of military surgery, pathology, ophthalmology, otolaryngology, Roentgenology, and plastic and oral surgery cooperated in the organization of this school, and lectures by members of the staffs of these schools constituted an important feature of the course. The hours of instruction were 9 to 11.30 a. m., 1 to 4, and 6 to 8 p. m. Twenty student officers were admitted to the reorganized school after examination to determine their qualifications for this branch of surgery. As a general rule only those men were accepted who had experience in general surgery, although exceptions were made in the cases of recent graduates who had served an internship in some hospital where the neurosurgical service was in charge of men of recognized ability. A few of the students exhibited marked aptitude for the course, the majority showed great progress, and all were enthusiastic. It did not appear to the instructors that the possible element of risk involved in teaching so vast a subject in such limited time would constitute a real menace to well-established and approved lines of training in neurosurgery.

The aims of the school were primarily to make a more intelligent selection of personnel for the enlarging demands upon the section of brain surgery and to give such personnel instruction in the fundamentals of the subject as a preparation for further clinical instruction either at the New York Neurosurgical School or at some Army hospital with adequate clinical facilities.¹³⁹ The instructors realized the impossibility of developing neurosurgeons by such a short course with the very limited clinical facilities at the camp. It was believed, however, that much could be accomplished by teaching the anatomy and physiology of the nervous system and the methods of routine neurological examination. The operative procedures in common use for brain trauma were emphasized. By arrangement with the University of Chattanooga, the anatomical department of this institution was used for work upon the cadaver and animal experimentation. It was thus possible to give a complete course in anatomy and to demonstrate a number of important physiological experiments having a direct bearing upon the problems of neurosurgery.

The schedule for the first week, November 12 to 16, 1918, was not full, owing to lack of instructors, but a full schedule was presented the week beginning November 18, 1918.¹⁴⁰

The instruction in the reorganized school was outlined as follows:¹³⁹

1. *Anatomy and physiology* (32½ hours).—These two subjects were taught together, so as to correlate closely structure and function. The subjects were taken up under seven topics, each topic considered in three ways:

- (a) Lectures on the physiological anatomy.
- (b) Anatomical demonstrations on the cadaver.
- (c) Physiological experiments on animals.

The topics were as follows:

- (1) Scalp, surface markings, osteology, blood supply, cerebrospinal circulation of the central nervous system.
- (2) Vegetative nervous system, and glands of internal secretion.
- (3) Peripheral nerves.
- (4) Spinal cord.
- (5) Hind-brain and mid-brain.
- (6) Cerebellum and thalamus.
- (7) Cerebrum.

2. *Pathology* (3 hours).—Study of cerebrospinal fluid—normal and pathologic; hemorrhage, infections, tumors of cord and brain, thrombosis, embolism, abscess, syphilis; repair of nerves, with especial emphasis on degeneration; muscle atrophy, and the obstacles to normal repair of injured nerves arising from infection; autopsies and methods of preservation of specimens.

3. *Operative surgery (cadaver)* (29 hours).—Demonstrations and lectures—immediate care of patients with war wounds of the nervous system; methods of wound sterilization and closure; treatment of hemorrhage and fracture, concussion, compression, contusion of brain; discussions of indications for surgical relief of traumatic intracranial pressure and decompression; prevention and treatment of hernia and fungus cerebri; discussion of foreign bodies; ventricular puncture and spinal puncture; injuries of spinal column and cord; laminectomy; injuries of peripheral nerves; methods of nerve repair; tumor of brain and cord; hydrocephalus; abscess; meningitis.

Operative surgery (animal); brain hemorrhage and laceration; wound closures; laminectomy and nerve suture.

4. *Clinical neurology* (18¾ hours).—The course in clinical neurology comprised lectures, quizzes, and presentation of cases.

- (1) History taking and writing.
- (2) Physical examination and record.
- (3) Sensory charts.
- (4) Visual fields.
- (5) Lumbar puncture indications; demonstration with pressure reading; interpreting in gross character of cerebrospinal fluid; laboratory examinations indicated; dangers and precautions.
- (6) Epidural injections—indications; demonstration.
- (7) Bárány test—purpose; interpretations; demonstrations.
- (8) Fundi examinations.
- (9) Case presentations.
- (10) Symposium on syphilis.
- (11) Lectures on the following: Paralysis; tremors; trophic disorders; diagnosis and localization of diseases of spinal cord; gait; ataxia; convulsions; sensation; reflexes; eye, with regard to physical signs of pupil, physical signs aside from pupil, eye reflexes; speech disturbances; aphasia; cerebrospinal fluid; electrical reactions.

5. *Ophthalmology* (4 hours).—Functional tests of ocular muscles, reflexes pupils, fundus. (Course by School of Ophthalmology.)

6. (a) *Military surgery* (4 hours).—Trauma, shock, hemorrhage, transfusion; early management of war wounds; principles of wound sterilization and healing; fractures, splints; Carrel-Dakin and dichloramine T technique. (Course by School of Military Surgery.)

(b) *Roentgenology* (2 hours).—Fracture of skull and spine; localization of foreign bodies; Roentgenology in its relation to war wounds of the nervous system. (Course by School of Roentgenology.)

(c) *Otology* (3 hours).—Tests for equilibrium; middle ear infections in their relation to sinus thrombosis and infections of the brain and its coverings. (Course by School of Otology.)

(d) *Surgical technique*.—Demonstration of surgical technique, at operations upon patients in General Hospital No. 14. Such patients were studied by the students whenever possible before and after operation. Whenever feasible, students assisted in operations.

The schedules varied somewhat, but the following are representative and show exactly how the work was divided:¹⁴¹

School of Neurosurgery—Class 1

FIRST WEEK (NOVEMBER 12 TO 16, 1918)

Tuesday	9 to 10 Method of history taking and writing	10.30 to 12 Clinic: Liberation median nerve	Lunch period (1 hour)		
Wednesday	10 to 11.30 Intracranial pressure—Lecture			1 to 2.30 Neurological examination	
Thursday		10 to 11 Intracranial pressure		1 to 2.30 Anatomy: Head and neck	2 to 3 Ophthalmology
Friday	9 to 10 Anatomy	10 to 11 Neurological examination with clinic		1 to 2 Anatomy of skull: Landmarks	2 to 3 General anatomy central nervous system
Saturday	9 to 10 Head injuries and intracranial pressure—Quiz	10 to 11.30 Clinic			

SECOND WEEK (NOVEMBER 18 TO 23, 1918)

Monday	9 to 10 Ophthalmology department; head injuries	10 to 11.30 Otology department; Bárány tests	1.30 to 2.30 Fundus examination	2.45 to 3.45 Ward N; brachial plexus	7 to 8 Pathological laboratory; pathology
Tuesday	9 to 10 Ward N; head injuries	10 to 11.30 Ward N; eyes symptoms	1 to 3 Ward N; Carrel-Dakin technique		7 to 8 Pathological laboratory; pathology
Wednesday	10 to 12 Science Building at Chattanooga University; dissection on cadaver		12.30 to 2 Chattanooga University; decompression operation	2 to 3 Chattanooga University; experimental cerebral compression	7 to 8 Pathological laboratory; pathology
Thursday	9 to 10 Ward N; trophic disturbances and convulsions	10 to 11.30 Ward N; general anatomy of central nervous system	1 to 2 Ward N; lumbosacral plexus	2 to 3.45 Ward N; clinic	
Friday	10 to 12 Chattanooga University; dissection on cadaver		12.30 to 2 Chattanooga University; osteoplastic flap	2 to 3 Chattanooga University; physiological demonstrations of sympathetic nerves	6.30 to 7.30 Ward N; syphilis and cerebrospinal fluid
Saturday	9 to 10 Ward N; hand and skin sterilization	10.15 to 11.30 Ward N; vegetative nervous system	Half holiday		

School of Neurosurgery—Class 1—Continued

THIRD WEEK (NOVEMBER 25 TO 30, 1918)

Monday	9 to 10 Ward N; cord localization and types of paralysis	10 to 11.30 Ward N; fractures of spine	1 to 2 X ray	2 to 3 Ward N; cord traets	
Tuesday	10 to 12 Chattanooga University; dissection on the eadaver		1 to 3 Chattanooga University; physiology—spinal and decerebrate preparations		6.30 to 8 Ward N; conference
Wednesday	9 to 10 Ward N; hind brain	10 to 10.45 Ward N; clinic	10.45 to 11.30 Ward N; peripheral nerve	1 to 2 Ward R; diagnosis of war wounds	2 to 3 Ward R; peripheral nerve surgery
Thursday	Thanksgiving Day				
Friday	10 to 12 Chattanooga University; dissection on the eadaver		1 to 3 Chattanooga University; operative surgery, osteoplastic flap		
Saturday	9 to 10 Ward N; mid-brain	10 to 11.30 Reflexes and sensation	Half holiday		

FOURTH WEEK (DECEMBER 2 TO 7, 1918)

Monday	9 to 9.45 Basal ganglia	9.45 to 10.30 Lumbar sacral	10.30 to 11.30 War neuroses	1 to 2 Nerve injuries	2 to 3 Clinic
Tuesday	9 to 12 Chattanooga University; spinal and decerebrate preparations			1 to 3 Chattanooga University; operative surgery	
Wednesday	9 to 9.45 Cerebrum	9.45 to 10.30 Lumbar sacral plexus	10.30 to 11.30 Cord tumors	1 to 2 Clinic	2 to 3 X ray
Thursday	9 to 10 Trauma	10 to 11.30 Brain tumors	1 to 2 Cerebrum	2 to 3 Clinic	6 to 7.30 Conference
Friday	9 to 12 Chattanooga University; dissections on cadaver			1 to 3 Chattanooga University; operative surgery	
Saturday	9 to 10 Cerebellum	10 to 10.45 Method of examination.	10.45 to 11.30 Quiz	Half holiday	

Professional school—Practical demonstration daily, 10 to 12 a. m.

Each man will be numbered. According to the number given him, and by consulting this schedule, he will report to the group assigned his number, on that day, where the roll will be called, also by number.

The most serious defect of the course was the scarcity of clinical material for operative purposes.¹³⁸ While the wards of General Hospital No. 14 furnished a reasonable amount of material for the study of organic neurology, there were very few cases requiring surgical operation. It was possible, however, with the available cases to demonstrate thoroughly the methods of neurological examination, and in a more limited way a number of neurological lesions.

The element of time in the training of medical officers was important, for the camp school permitted both the strictly military training and professional instruction to be given during the same period.¹³⁸ A further advantage of the camp school was the full-time service of the instructors, and this enabled an amount of individual instruction not usually found when private work is combined with teaching. It is admitted that the scope of such a school is necessarily limited and preparatory in character, but it may be reasonably claimed that under the conditions existing previous to the armistice, such a school could perform a service of definite and decided value.

Examinations were held at the completion of the course to determine the qualifications of the students for neurosurgical assignments.¹³⁸ As a result of these examinations 7 of the 20 men admitted to the school were found fitted for assignments either as assistants or ward surgeons in a neurosurgical service. A number of the remaining 13 did not complete the course either because of leave, transfer orders, or discharge from the service.

The school was closed by a camp order, December 24, 1918.¹³⁸

SCHOOL OF OTOLARYNGOLOGY

The School of Otolaryngology was organized May 12, 1918, and the first class began its work on the 18th of the same month.¹⁴² A considerable number of student officers awaited instruction, and a class of 16 was detailed for that purpose. A room in ward Q of the general hospital was set aside as the lecture room and equipment sufficient to permit of beginning work the following week was gathered together. The school was operated in connection with the ear, nose, and throat department of General Hospital No. 14, and soon outgrew the quarters assigned to it. This led to the removal of the wards and the school, in July of that year, to McDonald Field, where two buildings and a half of a third building were assigned for its use. The lower floor of one of these (ward No. 29) was set aside for clinical and teaching purposes. It contained two treatment rooms, 31 by 10 feet, with concrete floors, electric lights, etc.; a well-lighted operating room, 24 by 21 feet, with concrete floor; a sterilizing room; a private treatment room for officers; a dispensary room; an office for the director; and a lecture room 48 by 24 feet in size. All of these were conveniently connected one with the other. The three wards together contained 128 beds, most of which were constantly occupied.

At the beginning the equipment of the department was exceedingly meager; one nasal speculum and a tongue depressor virtually represented all that the staff had to work with.¹⁴² A requisition for a complete list of instruments and equipment was early sent in, and in due time everything that was needed in an up-to-date ear, nose, and throat clinic, both for treatment and for teaching, was provided. Without such equipment it would have been impossible to do the work that was accomplished. The operating room was fitted up with two operating tables and a Holmes operating chair, an Ohio Chemical & Manufacturing Co. gas-and-oxygen outfit, an instrument cabinet, dressing cases, and other needed equipment. The sterilizing room was provided with an electric American Sterilizing Co. apparatus, capable of sterilizing all dressings and instruments for the department. Each treatment room contained four places for examination and treatment of patients, with a wash bowl at each place serving as cuspidor, and electric connections for lights. At the end of each room there was a place for the assistant in charge of the clinic to work. Each room was provided with a modern Wappler suction apparatus. The private treatment room also was well equipped and contained a Wappler suction outfit. The lecture room was provided with blackboards and a Bárány turning chair.

The school was particularly fortunate in possessing an unusually valuable collection of sections of the head,^d a good supply of wet specimens of the head,^e a fine collection of lantern slides of the accessory sinuses,^f and a collection of excellent slides of the ear.^{142 g} Without these collections, satisfactory teaching would have been impossible.

The clinical material was abundant at times.¹⁴² At no time were there less than 1,200 patients, and often as many as 2,000 or 2,500, in the hospital. In

^d Loaned by Lieut. Col. Harris P. Mosher, M. C., Boston, Mass., and Lieut. Col. William H. Haskin, M. C., New York City.

^f A gift of Maj. H. W. Loeb, M. C., St. Louis, Mo.

^g A gift of Dr. B. Alexander Randall, Philadelphia, Pa.

addition to this, the various camps scattered throughout the park contained as many as 60,000 troops at times and served as feeders.

Altogether, 110 student officers passed through the school.¹⁴² These were selected after careful examination by the director or his assistant, and represented only a portion of those who desired to take the course. On account of the limited time it was impossible to admit beginners, only those showing real fitness being received, and these were not allowed to continue the course in case they proved, after a short time, to be incompetent.

The course was planned to run from 4 to 6 weeks, but from the fact that the War Department did not order the men away at the end of that time it extended in many cases to 8 and 10 weeks.¹⁴² It was the endeavor to make the course as thorough as possible in the time allotted for it. It consisted of lectures and practical work, observation of operations, ward walks, and the performance of operations by the pupil himself as he showed his ability.

While care was exercised in the preliminary examination to exclude all who were not qualified, it was early found that every officer, without exception, required systematic instruction in the fundamental branches of medicine. To that end particular attention was directed to the anatomy of the nose, throat, and ear, and to the symptomatology, diagnosis, and treatment of the affections of those organs.¹⁴³

Anatomy was taught by means of wet and dry specimens, by lantern slides, and upon the cadaver. The diagnosis and treatment of the various affections of the upper respiratory tract were taught by the various members of the staff. Illustrated and comprehensive lectures on the pathology of the upper respiratory tract were given by the department of laboratories. The importance of the X ray with reference to the diagnosis of the diseases of the upper respiratory tract was emphasized. The director of Roentgenology presented this subject to each class in a series of lectures, making use of the large collection of plates at his disposal. The director of the School of Ophthalmology lectured each month on the relationship of diseases of the eye to those of the ear, nose, and throat. It was felt that every student officer should have correct knowledge of the various anesthetics for operations on the ear, nose, and throat; accordingly, a course of lectures was given each month by the chief anesthetist of the hospital. The close relationship of otology to neurosurgery was recognized, and a series of lectures was given by the director of the School of Neurosurgery. The relation of diseases of the teeth to the specialty and the important subject of wound sterilization were also presented. A brief course of lectures on the history and literature of otolaryngology was given each month by the director, which included two clinical conferences.

The subject matter of all lectures was carefully reviewed each week by a series of quizzes which served to emphasize the principal points. While it was felt that the theoretical work was essential, it was recognized that the practical work was of greater importance. For this purpose the class was divided into groups of three or four and assigned to an individual instructor, under whose direction each student officer, provided with the proper instruments, each day worked in the clinic of the department, making examinations and following out treatments. The afternoons were largely devoted to witnessing operations, of which General Hospital No. 14 afforded a rich variety, and to ward walks.

As an officer showed himself qualified, he was permitted to perform or to assist in various operations under proper supervision. Those who had shown particular ability in the course, upon its completion were taken into the wards as student assistants. This afforded an opportunity for them to receive more careful instruction and also allowed a more complete estimate of their qualifications. Those who showed particular merit were assigned to the hospital staff and remained in this capacity until they were ordered out of the camp. In this way a constant succession of qualified officers passed through the hospital, the wards of this department serving, as it were, as an advanced post-graduate training school.

Each month the class was taken into the school of anatomy (q. v.) and given an opportunity to perform the principal operations on the nose, throat, and ear under the direction of an instructor. At the end of the course each student officer was given a patient of whom he was required to make a complete examination and to report his findings in writing. A written examination covering the lectures of the course was given to each officer. Based upon the results of the examinations, together with his work in the quiz and in the practical courses the officer was rated.¹⁴³

The school closed in December, 1918.⁷²

SCHOOL OF OPHTHALMOLOGY

This school had been in contemplation for a considerable period of time prior to its organization, and from June 15 to June 20, 1918, with the approval of the commandant of the camp, a preliminary survey was made of the available buildings and of the clinical material, the possible courses of instruction in ophthalmic work, and, in cooperation with other schools already established or in process of establishment, of the laboratory facilities, the staff required, and the standards for admission. The results of this survey, incorporated in a report which was submitted to the Surgeon General and to the commandant of the camp, were approved.¹⁴⁴ On August 7, 1918, preliminary lectures and demonstrations were begun, and on August 12 the formal opening of the school took place.

The building.—A new two-story ward building of General Hospital No. 14 was placed at the disposal of this school, to which building, after completion of the necessary alterations, the ophthalmic service was transferred. The first floor was arranged and equipped as follows: There were two rooms for refraction, each provided with trial cases, standard test-type cards, all the necessary apparatus for muscle testing, and with blackboards utilized during the hours of instruction.

Adjoining the rooms for refraction, eight stalls for retinoscopy and ophthalmoscopy were erected. These stalls faced a large room where the class of student officers might gather during the hours of didactic instruction and lantern demonstration, and where perimetry was taught and practiced. The stalls for retinoscopy and ophthalmoscopy were hung with heavy curtains, which could be drawn aside or not, as the conditions required, and in the central one a lantern screen was readily adjusted, its dark surroundings enhancing the distinctness of the pictures. If necessary, the lantern could be moved to either

of the refraction rooms, where it was used in the lectures on the theory of refraction and physiologic optics. The refraction room, and the one containing the retinoscopy stalls were in communication with it through a doorway. There was a large room in one end of which the appliances for the practical optician's work were stationed, and where all of the adjustment was made of the spectacle frames in which the lenses, ground according to the formulas furnished by the ophthalmologists, were mounted. In this room, as arranged, were also the tables for the clinical clerk, who recorded each patient referred to the service and who made the preliminary visual tests and took the history. Between the area devoted to the optician's worktable and the record table there was ample space and equipment for the treatment of the external diseases of the eye. This room communicated by a double doorway with a covered porch which ran the whole length of the building, and which was utilized during the summer as a waiting room. Facing the large room previously described was a room for operations on animals' eyes (pigs' eyes, sheeps' heads, etc.), a small, well-equipped room for operations on human eyes, and an office for the chief of service and for storing the records. A commodious, admirably appointed operating room in the otolaryngological building, which adjoins the eye ward, was also at the service of the ophthalmologic staff. Operations requiring general anesthesia were performed here.

In the remaining space of the first floor of the eye building was situated a ward of 16 beds. Rooms for nurses, linen, toilets, etc., had their usual relationship to this ward.

Such an arrangement of communicating rooms rendered the examination and the assortment of patients easy, and was advantageous in the division of the student officers into classes, according to the work to which they were assigned; that is, the treatment of external diseases of the eye, perimetry, retinoscopy, ophthalmoscopy, ward instruction, operations, refraction, etc.

Equipment.—In addition to the usual equipment for an active eye service which was to be utilized in teaching, to wit: Trial cases, perimeters, surgical instruments, stereoscopes, giant magnets, tonometer, etc., certain special equipment was procured as follows: (1) A lantern for the projection of opaque objects and slides; (2) several hundred lantern slides^a; (3) about 200 microscopic slides illustrating the histology and pathology of the eye; (4) sets of Oatman's plates ("Diagnostics of the Fundus Oculi"), with the necessary stereoscopes; (5) a thermophor.

The clinical material.—The material for the clinic and the course of instruction was obtained (a) from the regular dispensary service of General Hospital No. 14; (b) from the patients in the eye ward of the same hospital; (c) from the recruits as they were examined in the camp infirmary of Camp Greenleaf and the recruit depot at Lytle; (d) from the patients in the general medical, surgical, and the neurological wards of General Hospital No. 14.

The student officers.—The student officers in the medical officers' training camp were assigned to the various schools in operation as they qualified in the preliminary examinations, which were held daily for the purpose of making

^a For the most part these were duplicates of slides used by Lieutenant Colonel de Schweinitz in the University of Pennsylvania, to which, through the kindness of Dr. Howard F. Hansell and Dr. William M. Sweet, a number of slides were added, duplications of those employed in Jefferson Medical College, Philadelphia.

this selection. The largest number of those who found entrance into the School of Ophthalmology had, prior to their assignment to Camp Greenleaf, been "exempt to ophthalmology," on the files of the Surgeon General's Office; but, a certain number were selected from among those who had entered the service without such exemption, but who at their original investigation on arrival at the camp had expressed a preference for this special type of medical and surgical work. The preliminary entrance examinations were always conducted by the director of the School of Ophthalmology, or by one of his staff, and should the applicant qualify for the school, as soon as he had completed his period of military training he received his assignment, these assignments being made on the first and fifteenth of each month.

Length and outline of the course.—The length of the course was four weeks. The hours of instruction were daily from 9.30 to 11.30 a. m., and 1.30 to 4.30 p. m., except on Saturdays, when the instruction, which consisted in a series of quizzes covering the week's work, concluded at 11.30 a. m.

The outline of the course may be briefly summarized, as follows: Two hours daily, except on Saturdays, of systematic didactic teaching, including a review of the theory of refraction, muscle testing, other functional testing, anatomy and histology of the eye and its appendages, external diseases, ophthalmoscopy, ophthalmic neurology, and operations. These lectures were illustrated by means of the lantern, diagrams, freehand drawings, etc. Particularizing as to the days: On Mondays and Tuesdays three and one-half hours, and on Wednesdays, Thursdays, and Fridays one and one-half hours, were devoted to practical instruction in refraction, muscle testing, and diseases of the eye. On Wednesdays, Thursdays, and Fridays, two hours of each day were devoted to operative ophthalmology, the director or one of the staff performing operations on the patients who came to the eye service in General Hospital No. 14, and on patients referred to the director through the courtesy of one of the eye surgeons in Chattanooga. The student officers themselves performed the usual operations on pigs' eyes and sheeps' heads.

During each course two lectures of two hours each were given to the combined class of ophthalmology and otolaryngology, one on the eye complications of sinus and mastoid diseases, and one devoted to the subject from the standpoint of the otolaryngologist. At the request of the director of the School of General Surgery, two lectures were given to his classes during the course on the treatment of injuries of the eye, and two hours per week were devoted to practical work in ophthalmoscopy.

During the course two hours were set aside for instruction in the bacteriology and pathology of the eye; and this instruction was given in conjunction with the department of pathology, and concerned itself with the study of the sections to which reference has been made and with the bacteriologic examinations of the conjunctival sac, corneal ulcers, etc. One hour was devoted during the course to X-ray localization of foreign bodies in the eye, under the auspices of the X-ray department. Through the courtesy of the department of surgery, the class in ophthalmology had the opportunity of devoting one hour daily to eye work in the genitourinary ward of United States General Hospital No. 14, going to these wards in sections, and having the advantage, therefore, of

studying the specific infections of the eye. The same opportunity, and in a similar manner, was afforded the class in the medical, neurologic, and surgical wards of the hospital, whereby a wide range of ophthalmoscopic work was covered.

Each Saturday morning a quiz was conducted by the director and instructors, one hour for the class as a whole, and one hour for sections of the class. The quizzes were both oral and written, and the week's work was reviewed. During ward instruction, practical paper work, the method of keeping records and cross indexing were demonstrated. Naturally, the schedule of instruction was elastic, and the number of hours assigned to any particular topic might be altered as was deemed necessary.

Examinations.—The examinations for entrance into the School of Ophthalmology have been briefly referred to. At the conclusion of each four weeks' course the student officers of the class were graded according to their personality, according to the character of their work, both practical and theoretical, of which cognizance had been taken by each instructor, who turned in his report on each officer with whose work he had been specially concerned, and, according to an examination which was both oral and written. All reports and examination papers were reviewed by the director of the school, who determined the grade. It was upon this final examination, thus arranged, that the officer's ultimate retention for ophthalmic work in the Army was based.

The staff.—It was determined that the personnel of the staff of the School of Ophthalmology should consist of a director of the school, who should also be chief of the ophthalmic service of General Hospital No. 14, and eight instructors, one of whom should also act as ward surgeon. Naturally, the number of instructors was subject to change, according to the needs of the school and the character of the classes. The instructors were carefully selected according to their qualifications, determined by their records as teachers and practical ophthalmic surgeons in civilian life, prior to their entrance into the Medical Corps of the Army.

Instruction.—The School of Ophthalmology was organized and was in operation for the purpose of training ophthalmologists who had entered the service as such and were assigned to the medical officers' training camp for instruction. It afforded to student officers, even though they had in civilian life devoted long periods of time to eye work, an opportunity for postgraduate ophthalmic instruction which proved to be of the utmost service. It permitted all who were engaged in this work, either as instructors or as student officers, to approach their duties from the military standpoint and its necessities, not only as they existed here, but as they obtained overseas. The advantage of observing and learning the technique of the ocular examination of recruits and registrants was a good example of the type of such work. In so far as possible, emphasis was placed on the instruction which fitted the officers for ophthalmologic service abroad. In this respect the observations which were made during several months of inspection in France and England of British, French, and our own hospital systems, had been utilized in preparing the schedules of instruction, supplemented by advices received from time to time from the overseas eye service.

A feature of importance in the School of Ophthalmology was the work which had been maintained in cooperation with the other schools at Fort Oglethorpe, to which reference has already been made, notably the School of Surgery and the School of Anatomy, the School of Otolaryngology, the X-ray department, and the departments of pathology and bacteriology. The excellent opportunities for medical ophthalmoscopy in the wards of General Hospital No. 14 have been noted. The recently established School of Oral and Plastic Surgery had already made it possible for the student officers of the ophthalmic classes to learn in a broad sense the principles of plastic surgery so necessary in acquiring the technique of blepharoplastic work—operative work of the utmost importance in ophthalmic war surgery.

The school and its work put the Surgeon General in possession of information according to which requests for the assignment of ophthalmologists to various base hospitals in this country and base and evacuation hospitals abroad could be made with an intelligent understanding of their capabilities, because each week the records of the student officers in practical work and their grades acquired according to examinations were transmitted to those who were responsible for their assignment.

As has been pointed out, the preliminary examinations for entrance into the School of Ophthalmology decided whether it was desirable that the student officer should enter the class for ophthalmic training, or whether his acquirements were such that he could be more suitably employed in some other department of military medical or sanitary science. These examinations further decided whether the previous training and experience of the student officer in civilian life had been such that it was necessary for him to add to his ophthalmic qualifications, i. e., whether he should be at the conclusion of his military training immediately assigned to ophthalmic duties here and abroad. But for those who entered the school it was the final examination after the completion of the course which determined whether an officer should continue his work in the Army as an ophthalmic surgeon, or should be assigned to other types of work for which he was more definitely suited.

The clinical material which was available for this school was unusually rich, largely on account of the permission which was granted that the recruits who were examined, as before stated, should be utilized for ophthalmic examination. The cases which came under observation and those retained for treatment compared favorably with those in any active ophthalmic service in civilian life.

Although the number of operations on human eyes was comparatively limited, excellent material in this respect was available, and all the important ophthalmic operations were readily demonstrated by means of sheep's heads and pigs' eyes, and not only demonstrated, but the student officers themselves were given the opportunity to perform them. The pigs' eyes were removed with all of their orbital attachments and surrounded by a considerable area of the skin, and therefore with complete preservation of the lids, making it possible to perform the important ophthalmic operations exactly as if they were being done on the human subject. According to an arrangement with the School of Anatomy, ophthalmic operations on the cadaver were performed.

Prior to the establishment of the Ophthalmic School the attendance in the eye service was about 260 new patients a month. This attendance rapidly increased until the new patients per month amounted to between 500 and 600, and during periods when large numbers of recruits were sent from the recruit depot and camp infirmary for examination (and all of the recruits presenting interesting ocular findings were referred to the eye clinic) as many as 1,500 new patients were examined in one month. Naturally, the recruits were not retained as patients, but none the less they were utilized in the ophthalmic instruction.¹⁴⁴

Even with this number lack of clinical material was the biggest defect in making for the best possible course.¹⁴⁵ This could have been overcome partly by placing the director of the school in charge of all of the eye work in the entire camp, as a great deal of good material was lost by not referring interesting and important cases to the school. An exception was the camp infirmary, which heartily cooperated in every way.

Inadequate space for handling large classes was perhaps of secondary importance. At one time there were 61 student officers in the school and it was utterly impossible to properly take care of them. Equipment had been lacking in the way of refraction cases, trial frames, proper illuminating fixtures for test charts, etc. Painful delay was often experienced in securing batteries for electric ophthalmoscopes and such minor things.¹⁴⁵

If the course had been lengthened to eight weeks, or even six weeks, instead of four, the men could have been trained to much better advantage, and a great number of officers could have been taken in the school and used as assistants afterwards who were lost to the department.

The total number of student officers examined for the course in ophthalmology was 185, of whom 129 were found qualified for the course; of these, 109 were assigned to the course, 93 being finally qualified.¹⁴⁵

The dominant thought in teaching was primarily to instill the idea of system and thoroughness—systematic method of making external examinations, and of making records and reports. It was found that even with physicians with practical ability and excellent reputation, the lack of system, admittedly, was their most serious defect.¹⁴⁵

Schedule of course in ophthalmology for December, 1918.¹⁴⁵

FIRST WEEK

	Monday	Tuesday	Wednesday	Thursday	Friday
9 to 10 a. m.	Lecture: "Routine of examination of patients"	Lecture: "Retinoscopy"	Lecture: "Physiological optics"	Lecture: "Functional testing"	Lecture: "Lids and lacrymal apparatus"
10 to 11.30 a. m.	Practical work	Practical work	Practical work	Practical work	Practical work
1.30 to 2.30 p. m.	Lecture: "Refraction"	Lecture: "Muscle testing"	Lecture: "Surgery of lids"	Lecture: "Principles of plastic surgery"	Lecture: "Surgery of conjunctiva"
2.30 to 3.30 p. m.	Practical work	Practical work	Practical work	Practical work	Practical work
3.30 to 3.45 p. m.	Quiz; conference	Quiz; conference	Quiz; conference	Quiz; conference	Quiz; conference

Saturday, 9 to 11 a. m., quiz.

Schedule of course in ophthalmology for December, 1918—Continued

SECOND WEEK

9 to 10 a. m.	Lecture: "Conjunctiva"	Lecture: "Cornea"	Lecture: "Uveal tract"	Lecture: "Media and sclera"	Lecture: "Fundus"
10.30 to 11.30 a. m.	Practical work	Practical work	Practical work	Practical work	Practical work
1.30 to 2.30 p. m.	Microscopical pathology; progressive sectional groups	Microscopical pathology; progressive sectional groups	Lecture: "Surgery of conjunctiva"	Lecture: "Surgery of eye muscles"	Lecture: "Surgery of orbit"
2.30 to 3.30 p. m.	Practical work	Practical work	Practical work	Practical work	Practical work
3 to 4 p. m.				Lecture: "Accessory sinuses"	
3.30 to 3.45 p. m.	Quiz; conference	Quiz; conference	Quiz; conference		Quiz; conference

Saturday, 9 to 11 a. m., quiz.

THIRD WEEK

9 to 10 a. m.	Lecture: "Heterotopia"	Lecture: "Functional testing"	Lecture: "Pupillary reflexes and visual paths"	Lecture: "Focal infections"	Lecture: "Fundus"
10 to 11.30 a. m.	Practical work	Practical work	Practical work	Practical work	Practical work
1.30 to 2.30 p. m.	Microscopical pathology; progressive sectional groups	Lecture: "Fundus"	Lecture: "Surgery of cataracts"	Lecture: "Surgery of glaucoma"	Lecture: "Surgery of foreign bodies"
2.30 to 3.30 p. m.	Practical work	Practical work	Practical work	Practical work	Practical work
3.30 to 3.45 p. m.	Quiz; conference	Quiz; conference	Quiz; conference	Quiz; conference	Quiz; conference

Saturday, 9 to 11 a. m., quiz.

FOURTH WEEK

9 to 10 a. m.	Lecture: "Injuries"	Lecture: "Neurology"		Lecture: "Accessory sinuses"	Lecture: "X-ray localization of foreign bodies"
10 to 11.30 a. m.	Practical work	Practical work	Practical work	Practical work	Practical work
1.30 to 2.30 p. m.	Lecture: "Fundus"	Lecture: "Fundus"		Surgery	Surgery
2.30 to 3.30 p. m.	Practical work	Practical work		Practical work	Practical work
3 to 4 p. m.		Lecture: "Bacteriology and pathology of eye"			
3.30 to 3.45 p. m.	Quiz; conference			Quiz; conference	Quiz; conference

Saturday, 9 to 11 a. m., quiz.

Practical work in the course included:¹⁴⁵ Refraction; muscle testing; outlining visual fields and scotomata; examinations of fundi in wards and clinic; examination of external diseases in patients in wards and clinic; operations on pigs' eyes and on patients in General Hospitals No. 14 and in West-Ellis Hospital in Chattanooga. The talks on surgery were illustrated by lantern slides and drawings and were followed by the operation itself on animals' eyes, patients, or cadaver; also practical paper work and demonstration of method of keeping records and cross indexing. In quiz conference held daily at 3.30 p. m., the student officers asked questions of the director concerning anything that had come up during the day. This schedule showed the final development of the school.

The school closed December 24, 1918.⁷²

SCHOOL OF UROLOGY

The School of Urology was organized during February, 1918. The first course of instruction began on March 1.¹⁴⁶ The school was established in the base hospital at the camp, the genitourinary service of which was thoroughly reorganized and an excellent clinic arranged for purposes of teaching. The courses given were intensive, but thorough. The curriculum provided for theoretical instruction and the practical application of the most advanced methods, the clinical material being provided at the hospital. All laboratory work in connection with this service, with the exception of Wassermann tests, was done in the genitourinary ward, by student officers under competent supervision. Dark field illumination examinations were made daily and every man was taught the use of the endoscope and the cystoscope.¹⁴⁶

Many of the applicants for instruction in the school were found, upon examination, to be better suited to other branches of medicine, and were transferred accordingly.¹⁴⁷ In order to select properly qualified men, all student officers who applied were examined before they were taken into the classes, the examinations being oral, written, and practical. It was the object of the director to take such qualified men as were left, and to give them the excellent advantages offered by the clinic.

It was not hoped to make surgeons of these students, but the purpose was to acquaint them with the important points in urology. The subjects taught comprised differential diagnosis, genitourinary therapy, clinical laboratory work, minor surgery, endoscopy, cystoscopy, urethral catheterization, renal functions, diagnosis and treatment of lues.¹⁴⁸

The diagnosis and treatment of chronic gonorrheal urethritis and its complications was stressed in order that officers who became qualified for assignment to organizations, would be fully equipped to aid in the solution of the problem of noneffectives, the result of gonorrhea, many thousand of such cases having been accumulated in development battalions.¹⁴⁸

It was soon found desirable by the director to secure an assistant, especially trained in laboratory and clinical microscopy; this proved of great advantage, not only to the student body, but also to the general hospital, in the recognition and intelligent conduct of such cases classified as venereal and genitourinary. About the same time it was also found necessary to have assigned to the school

an assistant especially trained in the diagnosis and treatment of dermatological cases.¹⁴⁹

The course of instruction extended over a period of approximately one month. The first two classes contained 7 and 8 students, respectively,¹⁵⁰ but later the classes became much larger, reaching approximately 40 men in September, 1918.¹⁵¹

The school closed the latter part of December, 1918.⁷²

SCHOOL OF PLASTIC AND ORAL SURGERY

The School of Plastic and Oral Surgery began its work October 22, 1918.¹⁵² Only two classes received instruction, and the school closed December 24, 1918.¹⁵³ The classrooms used were in the building occupied by the School of Military Surgery. The course given from October 22 to November 16, 1918, with the amount of time devoted to the various subjects, is outlined below:¹⁵²

Surgical anatomy of head and neck:	Hours
Demonstrated by special dissections on cadaver.....	15
Demonstrated by special dissections on bones of the face.....	5
Demonstrated by lantern-slide illustrations.....	2
Didactic lectures and recitations.....	5
Total.....	27
Operative course:	
Principles of plastic surgery (didactic).....	10
Plastic methods on the cadaver.....	15
Plastic methods on anesthetized animal.....	2
Plastic methods on eyelids and conjunctiva (pigs' heads used).....	4
Total.....	31
Fractures of jaws:	
Fractures and theory of jaw splinting (didactic).....	3
Descriptions and lantern-slide illustrations on types of splints.....	1
Practical demonstration of dental appliances used in treatment of jaw fractures....	1
Practical demonstration of prosthetic appliances used in maintaining contour of face during period of reconstruction.....	1
Total.....	6
Anesthesia:	
Local anesthesia—	
Varieties, methods of use, technique, anatomic locations of points for nerve blocking, conditions in which applicable, when advisable.....	4
General anesthesia—	
Varieties and methods of administration. Precautions to be taken before, during, and after operations, intratracheal method described in detail and technique of introduction of tube shown on cadaver intrapharyngeal and intranasal methods.....	3
Total.....	7
Wounds of face, mouth, and jaws:	
Trauma of skin and underlying soft parts.....	1
Injuries to salivary glands and their ducts, salivary fistula.....	2
Wound dressings.....	2
Value of rest in treatment of wounds.....	1
Infections and their control.....	2
Complications and their treatment.....	3
Total.....	11

Miscellaneous subjects:	Hours
Mouth infections.....	2
Necrosis of jaw.....	1
Tumors of the jaw and the tongue.....	2
Diseases of the sinus maxillaris of oral origin.....	2
Burns and methods of treatment.....	1
Deformities due to scar tissue contractions.....	2
Skin grafting—Varieties and technique.....	2
Hemorrhage and shock.....	2
Intravenous injections and blood transfusion.....	1
Postoperative care of patients.....	1
Nerve trauma in repair—Repair of divided nerves, neuralgia.....	3
Roentgenology in its relation to plastic and oral surgery.....	2
Total.....	21
Total length of course.....	103

Subjects of lectures and demonstrations given to class No. 1 by the staff of the School of Plastic and Oral Surgery, Camp Greenleaf, Chickamauga Park, Ga., from October 22 to November 16, 1918:

Basic principles of plastic surgery.
 War injuries of face and jaws. Types and treatment.
 Demonstrations of plastic methods and types of operations shown on cadaver and on anesthetized animals.
 Fractures of jaws. Varieties of splints most applicable.
 Mouth infections. Necrosis of jaw.
 Bone grafts and cartilage transplants.
 Skin grafting.
 Scar tissue contractions. Results of operative measures to correct.
 Salivary fistula. Ranula.
 Surgical anatomy of head and neck, with demonstrations of special dissections.
 Principles of plastic surgery.
 Plastic operations on cadaver and anesthetized animal.
 Local anesthesia. Detailed technique.
 General anesthesia. Precautions before, during, and after.
 Intratracheal and intrapharyngeal technique.
 Injuries of the tongue and floor of the mouth.
 Fractures of the jaws.
 Complications following mouth injuries.
 Tumors of jaw.
 Nasal deformities.
 Injuries of salivary glands and ducts.
 Burns.
 Skin grafts: Varieties. Technique.
 Hemorrhage and shock.
 Intravenous injections and blood transfusion.
 Semiweekly reviews and quizzes on important practical points.
 Review of principles of plastic surgery.

Subjects of cooperative lectures and demonstrations given the students in the School of Plastic and Oral Surgery by the directors and instructors of other schools at Camp Greenleaf from October 22 to November 16, 1918:

School of Military Surgery—

Trauma.
 Infections and their control.
 Value of rest in the treatment of wounds.
 Demonstration of wound dressing.
 Bacteriologic control of wounds.
 Carrel-Dakin treatment.
 Dichloramine-T.

School of Otolaryngology—

Surgical anatomy of the nasal area.

Infections of the sinus maxillaris of traumatic origin.

School of Ophthalmology—

Emergency treatment of eye injuries.

Plastic operations on eyelids and conjunctiva. (Demonstrated on pigs' heads.)

School of Roentgenology—

X ray in its relation to plastic and oral surgery.

School of Neurosurgery—

Nerve trauma.

Nerve repair.

Neuralgia.

School of Dental Surgery—

Dental appliances used in treatment of jaw fractures.

Prosthetic appliances used in maintaining contour of face during period of reconstruction.

The schedules for the first class were as follows: ¹⁵²

Class 1.—*School of Plastic and Oral Surgery*

FIRST WEEK (OCTOBER 22 TO 26, 1918)

Hours	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10		Head injuries	Fractures of jaws (illustrated by lantern slides)		
10 to 11	Demonstration of elasticity of tissue; transverse incision suturing in vertical plane; flap sliding, taking tissue from neck	Anatomy of scalp and superficial portions of face and neck			Treatment of fractured jaws
10 to 11.15			Muscles of mastication; their influence in displacing fragments in fractured jaws; burns and scalds	Entire day given to addresses by surgeons of England, France, and Italy dealing with surgical procedures used to greatest advantage in dealing with war wounds	
11 to 12	Demonstration of lip and mouth injuries approximated so as to form a red epithelial border; flap from forehead to repair defect in cheek; flap from neck to repair defect in cheek; flap from forehead to form a new nose				Wounds and contusions and the principles underlying their treatment; special consideration of wounds of the mouth and their complications

Class 1.—*School of Plastic and Oral Surgery*—Continued

FIRST WEEK (OCTOBER 22 TO 26, 1918)—Continued

Hours	Tuesday	Wednesday	Thursday	Friday	Saturday
12 to 2	Lunch and study				
2 to 4	Importance of sufficient width of base, and circulation for all flaps used in plastic work; Beck's method of promoting epithelial growth by strapping wounds; demonstration of use of stay sutures, and forms of dressings to relieve tension of tissues in operative field		Practical demonstrations of wound dressings		Half holiday
2 to 3		Mouth infections			
3 to 4		Lantern demonstration of operative results in plastic work; removal of scar tissue contractions of neck, lip, and nasal cases			

SECOND WEEK (OCTOBER 28 TO NOVEMBER 2, 1918)

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10	Surgical anatomy of the nasal area; wet and dry specimens	Surgical anatomy of the nasal area	Surgical anatomy of the nasal area	Principles of skin grafting	Entire day's work in anatomic rooms in plastic operations	Value of rest in treatment of wounds
10 to 11.30	Injury to salivary glands and their ducts, treatment of salivary fistula	Mouth infections; necrosis of mandible	(Anatomic room.) Basic principles of plastic surgery; technique of skin approximation	Traumatic conditions of antrum and treatment	Ligations of vessels of neck. Bone implantations in nasal area, and into jaw	Hemorrhage and shock
12 to 2	Lunch and study					
2 to 3	Complications following injuries about face and jaws, and treatment	Relations of bones of face and points of muscular attachment; relations of accessory sinuses shown on specially dissected skulls	Operations upon anesthetized dog; ligations of vessels and flap formations; varieties of skin grafts, operations about eyes and mouth	Dental appliances used in treatment of jaw fractures and prosthetic appliances used in maintaining contour of face during period of reconstruction	Plastic operations reconstructing area about eyes; resections of temporo-mandibular joint	Half holiday
3 to 4	Trauma of skin and underlying soft parts					

Class 1.—*School of Plastic and Oral Surgery*

THIRD WEEK (NOVEMBER 4 TO 9, 1918)

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10	Entire day devoted to anatomic work in anatomic laboratory, Chattanooga	Entire day devoted to anatomic demonstrations dealing with points and relations essential in plastic and oral surgery; anatomic laboratories, Chattanooga	Nerve trauma; repair of divided nerves	Trauma	Injections and their control	Local anesthesia
10 to 11.30	Specially prepared dissections of head and neck demonstrated by the staff of instructors of the school		Quiz and review of basic principles of plastic surgery	General anesthesia, varieties and methods of administration; precautions to be taken before, during, and after operations	X ray in its relation to plastic and oral surgery	Weekly review of practical points
11.30 to 1.30	Lunch and study					
1.30 to 2.30				Plastic surgery in the area surrounding the eyes	Plastic surgery of the conjunctiva	Half holiday
2.30 to 4			The nasal accessory sinuses in relation to trauma of the face and plastic surgery (lantern-slide illustration)	Practical work; operations upon eyelids (pigs' heads used in this work)	Practical work; operations upon eyelids and conjunctiva (pigs' beads used)	

FOURTH WEEK (NOVEMBER 11 TO 16, 1918)

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10	9 to 10	9 to 10	9.30 to 12	9.30 to 12	9 to 10
Varieties of local anesthesia (continued)	Discussion of questions brought up by class regarding local anesthesia	Mouth infections	Plastic operations and anatomic demonstrations on cadaver in anatomic laboratories, Chattanooga University	Plastic operations and anatomic demonstrations on cadaver in anatomic laboratories, Chattanooga University	Diseases of the maxillary sinus complicating or secondary to oral surgical condition
10 to 11.30	10 to 11.30	10 to 11.30			10 to 11.30
Injuries to the seventh nerve; treatment	Tumors of the jaw	Trigeminal neuralgia; treatment			Weekly review of practical points
11.30 to 2 Lunch and study			12 to 1 Lunch and study		11.30 to 2 Lunch and study
2 to 3	2 to 3	2 to 3	1 to 3	1 to 3	Half holiday
Technique of using local anesthetics	Quiz; the seventh and fifth nerves	Repair of destructive injuries about lips and of palate	Plastic operations and anatomic demonstrations on cadaver in anatomic laboratories, Chattanooga University	Plastic operations and anatomic demonstrations on cadaver in anatomic laboratories, Chattanooga University	
3 to 3.45	3 to 3.45	3 to 3.45			
Anatomic locations of points for nerve blocking and routes of approach	Class dismissed to attend lecture by Ambassador Morgenthau	Intravenous injections; blood transfusions			

SCHOOL OF MILITARY ROENTGENOLOGY

The School of Military Roentgenology was established January 2, 1918,¹⁵⁴ and closed in January, 1919.¹⁰⁶

The function of the school at this time was to select the medical officers best fitted for service as Roentgenologists, and to give them a preliminary course of instruction in the following subjects: Principles of interpretation anatomy (particularly of the bones and joints) as revealed by X-ray plates; pathologic changes; standard radiographic positions (drill); fluoroscopy; stereoscopy; report writing, and the handling of exposed plates. This work was carried on in the X-ray department of the base hospital, Fort Oglethorpe (General Hospital No. 14), which consisted of a radiographic room, a fluoroscopic room, and a very small developing room. The space was inadequate, but the clinical material was extensive, and the enthusiasm of the instructors, as well as student officers, was of a high degree. It was apparent that much could be accomplished in larger quarters, and it was the early conviction of the director that with adequate accommodation and equipment, there were many advantages in favor of making this a school for a complete course of training, where all such training in the United States could be accomplished.

Because of the crowded condition of the hospital, extra space was difficult to obtain. During the latter part of March steps were taken to secure post barracks building S for the X-ray department of the hospital. The localization laboratory, consisting of six complete units, was installed in temporary quarters, so that instruction in localization of foreign bodies was started on July 17. The elementary and advanced physical laboratories were installed in hospital tents and were ready for operation when electric current was first available on July 24. By working three sections a day the student officers of the previous classes had received their final instruction in machine construction, repair and operation, and in localization of foreign bodies, by August 6, and their work was so arranged that the class entering the school August 1 could take up the regular assignments of the complete course. Work in the tents and temporary localization laboratory continued throughout the time that the building S was being arranged for the X-ray laboratory of the hospital for the permanent quarters of the school. These changes were practically completed by the middle of August, 1918.

No sooner had the new building been occupied than it was called upon to take larger classes. The space and assignment sheet permitted of doubling the output, and it was decided to shorten the course to two months in order to hasten the supply of Roentgenologists. In shortening the course, the more advanced clinical instruction was sacrificed more than work in localization of foreign bodies, the machine course, and the anatomy and position drill.

By the middle of September the school was called upon, in the following communication, again to double the number of student officers and enlisted men; or, in other words, to furnish 100 officers and 100 enlisted men each month.¹⁵⁵

¹ Based, in the main, on: "The Camp Greenleaf School of Roentgenology" by Lieut. Col. Willis F. Manges, M. C. published in the *American Journal of Roentgenology*, New York, 1919, vi, n. s., No. 7, 305.

SEPTEMBER 28, 1918.

From: The Acting Surgeon General, United States Army.

To: Maj. Willis F. Manges (through the commandant), Camp Greenleaf, Ga.

Subject: Memorandum on enlargement of school of Roentgenology.

1. *Arrangement of course.*—Capacity of school desired:

Medical officers each month.....	96
Manipulators each month.....	96
Manipulators, to be trained at Army Medical School during temporary stress, per month.....	48

The principal business of the Camp Greenleaf school is to properly train medical officers, and this should not be lost sight of in the effort to turn out manipulators. A greater number of manipulators than 96 would be welcome, but it is believed that it would interfere with giving proper attention to the medical officers.

Of the medical officers, the training is to be as follows:

Men qualified in interpretation and the medical phases of the work to handle base hospitals.....	72
Men well qualified only for localization.....	24
	<hr/> 96
Men especially qualified to operate base hospital type of apparatus.....	24
Men especially qualified to operate portable unit.....	72
	<hr/> 96

Of the manipulators, training to be substantially equal for all men. The courses as arranged in the outline submitted is excellent and should prove very workable. The use of trays for developing instruction is indorsed. It conforms to practice of the schools of aerial photography at Rochester and Ithaca. Present plans for the manipulators' course are heartily approved. A copy of the outline of the course and series of questions for the guidance of instructors, as mentioned in the plan of instruction of manipulators just submitted, is desired by this office when the outline is compiled.

It is the firm opinion of the undersigned that four students per machine can not be properly instructed in the elementary laboratory. There just isn't room for 24 men and the necessary instructors in the laboratory at one time, and there are not machines enough to keep the men busy. Better work, fewer men, and less time per section, and double the number of sections until such time as additional instruction units can be had. Parts for these are under order, as listed under "New equipment."

Ambulance.—The rate of training of teams for the ambulance should be at present about 10 teams each month. Each team is to consist of a medical officer and two enlisted men. This output is subject to revision in accordance with news from overseas.

* * * * *

By direction of the Acting Surgeon General:

GEO. C. JOHNSTON,
Lieutenant Colonel, Medical Corps, United States Army.

This required both additional space and a rearrangement of the assignments so that 50 officers and 50 enlisted men could be taken into the school each two weeks. Accordingly the adjoining building, known as T, was secured and fitted up for the purpose.

The teaching staff had to be enlarged each time the demands were increased. A medical officer who had been in active service in France for more than one year came to the school early in September and delivered a course of lectures with a view of bringing to the instructors and student officers an intimate knowledge of the conditions at the front. This close contact with one who had been at the front was a factor of appreciable value to the director as well

as to the instructors and students. Instructors at all times were selected solely on their fitness to teach some particular phase of the work, and in the majority of instances were officers who previously had been student officers in the school. In this way the desired results were obtained without at any time having kept at the school large numbers of men who had a wide practical experience. Each instructor was given the opportunity of selecting his own assistants from the classes; and, wherever it was possible, enlisted men or noncommissioned officers or Sanitary Corps officers were used in the strictly technical or mechanical phases of the instruction; for example, in the developing room, physical laboratories, and mobile unit manipulation. The instruction to manipulators was given entirely by Sanitary Corps officers and enlisted personnel.

The curriculum of the school was at all times based on the idea that men were being trained to do the kind of X-ray work that was met with at the front, both in the forward hospitals and those farther from the fighting line. It was of prime importance that the officer should be able to operate properly any type of machine; and to keep his machine in operation even under the most trying circumstances, that he should know all parts of his apparatus thoroughly so as to be able to directly supervise the installation or dismantling and transportation. The instruction in development of plates was given with more intensity to the manipulators than to the officers.

The course in anatomy and position and exposure drill was looked upon as one of the important features, since the whole subject of reports, whether of localization of foreign bodies, of fractures, or other lesion, is based upon an accurate use of anatomical terms, and knowledge of the appearance of the normal was considered essential to the easy recognition of the abnormal. It also afforded the opportunity to all of the students of making practical application of the instruction they had just received in the machine course. This course was further augmented by fluoroscopy of the normal.

Localization of the foreign bodies was taught just as thoroughly as possible, with complete equipment and models containing foreign bodies. It was one of the most satisfactory features of the course, as well as one of the most important.

Of the clinical subjects, most attention was paid to fractures and diseases of the bones and joints, especially the infections following war injuries. In addition to the lecture course, in which carefully selected lantern slides were used for illustration, a large collection of original radiographs was studied by sections of the class under the guidance of assistant instructors. Special consideration was given to the matter of report writing in such cases.

The instruction with reference to the chest and its contents followed very closely the text of the United States Army X-ray Manual, and lantern slides were depended upon largely for instruction in interpretation. The hospital furnished a large amount of lung material, so that each student studied numbers of patients both fluoroscopically and by means of stereoscopic plates, or single plates taken at the bedside. The time allotted for this instruction permitted close attention only to the more gross lesions, such as fairly well advanced tuberculosis, pneumonic consolidations, effusions, and pneumothorax. The

diseases of accessory sinuses, mastoids, and teeth were taught by means of lantern slides as well as by section work in the radiographic and view box rooms. The clinical material was at all times abundant.

Instruction in the diseases of the gastrointestinal tract and urinary tract was given by means of slides and in the radiographic and fluoroscopic rooms. No attempt was made to be thorough except in the matter of technique. This class of patients, however, furnished opportunity for a large amount of fluoroscopy, and no occasion was lost to give the student officers opportunity to use the fluoroscopic apparatus.

All departments of the hospital were encouraged to request bedside examinations of patients too ill to be moved. This work was done mainly by the students under the supervision of a capable instructor. The results were of surprising excellence, and the number of patients examined per day was usually quite large. This bedside work was thoroughly appreciated by the various chiefs of service, and was of the utmost value to the school as a means of instruction.

Instruction in the therapeutic use of the X ray was limited to individual training in operation of the Coolidge tube at a standard treatment exposure set of conditions, and in the use of filters, protection of surrounding parts, etc. No attempt was made to teach the application to any particular disease.

Instruction to enlisted men was limited to the operation, care, and repair of apparatus, to developing-room work, to assisting in the radiographic and fluoroscopic rooms, and to the filing of records and plates.

In addition to the instruction given to the students of the School of Roentgenology, courses of illustrated lectures or fluoroscopic demonstrations were given to the student officers of the various other schools at Camp Greenleaf. For example, two lectures a week were given to the School of Surgery, two to the School of Orthopedic Surgery, one to students in otolaryngology, one in oral and plastic surgery, and occasional demonstrations to the School of Cardiovascular and Lung Diseases. The object of these lectures and demonstrations was to acquaint the several specialists with the sort of aid they might expect to get from the X-ray department, and to cultivate as much as possible a spirit of cooperation. This matter of cooperation was further carried out by having available at all times a capable instructor who could take plates and records to the surgical operating rooms or wards on occasions when such records might be of value in operations or in the instruction of the various classes. The instruction thus given to the various other specialties was started early in January, 1918, and was carried on throughout the year, with a great deal of benefit to all concerned. In fact, this very feature was looked upon as one of the important reasons for having a complete School of Roentgenology at Camp Greenleaf.

The floor plan of building S was arranged with special attention to the handling of a large number of patients; or, in other words, primarily as an X-ray department of the hospital, and secondarily for school purposes. Fortunately, the plan worked well for both, the first floor and part of the second floor being reserved especially for the accommodation of patients and the remaining part of the second floor, as well as two basement sections, being used for school pur-

poses. All changes were planned in such a manner that by the mere tearing down of the partitions and removal of apparatus the building would be in its original condition without damage. The partitions, ventilation, light-proof shutters, and most of the wiring in this building was done by outside contractors, but all of the installations and a considerable amount of wiring was done by the officers and enlisted personnel of the school. All of the work in building T was done by the school organization and furnished a great deal of very valuable training, especially to the students of the enlisted personnel.

Selection of student officers for the School of Roentgenology was always a matter of considerable moment to the director, and the process went through a sort of evolution in keeping with the development of the camp as a whole. During the first months a great deal of individual effort was necessary in order to find the officers who had had previous X-ray experience, and it was at times difficult to get and especially to hold them. The plan of calling for volunteers by means of notices read to the companies brought forth a large number of applicants, among them many who were not well fitted for the work, but the plan did have the advantage of bringing the opportunity to the attention of those who had had previous experience. The greatest objection to this plan was the fact that it frequently turned out that the men selected had been retained in the Surgeon General's Office for some other service, this being learned only when orders came taking such men from the school. Later, the board of examiners, who examined all officers entering the camp in surgery and medicine, referred to the X-ray school all officers who claimed to have had any experience whatever in X-ray work or who especially desired to take up the work. By this means a little more than half the desired number of students was obtained. In order to fill up the classes the president of the board of examiners selected from the files the cards of men who had passed good examinations in surgery but who had not been taken up by the surgical chief. It was considered a matter of importance that the student Roentgenologists should know surgery, for they were to be surgical assistants of the first degree of importance. With this class of officers, mostly under 40 years of age, some of the most gratifying results were obtained. They were particularly adaptable to training for forward hospitals where the work was largely a matter of localization of foreign bodies and the study of fractures. This plan was found to be the best obtainable and was fairly satisfactory.

The enlisted personnel was obtained entirely through various group commanders, being selected, as far as possible because of their fitness, from among the limited service men. Those who could not readily grasp the work were sent back to their former organizations.

The whole scheme of instruction worked well, and the schedule, as to the number of hours devoted to each phase of the subject, represented the minimum that was practicable for obtaining efficient results.

OUTLINE OF COURSE IN X-RAY PHYSICS AND ELECTRICITY, ELEMENTARY AND ADVANCED
LABORATORIES

Purpose of the course.—This course was designed to acquaint medical officers selected for X-ray service with the various types of apparatus they might be called upon to operate when assigned to duty. While there was no intention to attempt to make electricians or physicists of them, still a considerable amount of time was spent upon the principles underlying the production of X rays. This was deemed necessary in order that the men might have a basic knowledge that would enable them to render continuous efficient service under the varying and often adverse conditions of military Roentgenology.

Outline of instruction.—Laboratory work comprised the major part of this course. The sections and apparatus were so arranged that each man must himself do the work under the supervision of an instructor. The only objection to this plan was that it demanded more than the usual number of instructors and hence added expense. This objection was largely overcome by using selected enlisted men to act as assistants on the various units, all work being done under the direct supervision of a medical officer.

The laboratory work was given in several parts. First, the men gained a fundamental knowledge of electricity by making selected experiments on a unit called the "principles of electricity table." Hereafter this unit is designated by the term "principles table." The class was given instruction in the operation of the rectifying type of machine on units called "test machines." Succeeding this, the following units were taken up: United States Army portable gas electric set, United States Army portable instrument box, United States Army bedside unit, induction coil outfit (gas tubes) and, finally, the various makes of base hospital machines.

Each morning, before the class went into the laboratory, the lecture was given. The course of lectures was designed to parallel the laboratory work as closely as possible, and followed literally the text of the manual, with simple analogies for explanation. The last five lecture periods were devoted to review, and opportunity was given the class to clear up any points not made clear on first presentation.

The school day was made up as follows:

(a) For medical officers during their first month of instruction:

8.30 to 10.30.....	Section work as assigned.	1 to 2.....	Lecture.
10.30 to 11.30.....	Lecture.	2 to 4.30.....	Section work.
11.30 to 1.....	Mess.		

(b) For medical officers during their second and third months of instruction:

8.30 to 9.30.....	Lecture.	1 to 2.....	Lecture.
9.30 to 11.30.....	Section work as assigned.	2 to 4.....	Section work.
11.30 to 1.....	Mess.		

(c) For enlisted men throughout their course:

8.30 to 9.....	Care of the apparatus.	1 to 2.....	Lecture.
9 to 11.30.....	Section work as assigned.	2 to 4.30.....	Section work.
11.30 to 1.....	Mess.		

The lectures were divided among the various subjects as follows:

(a) Medical men during their first month (this series of lectures repeated monthly):

Physics and electricity.....	15
Review quiz.....	5
Developing.....	5
X-ray anatomy.....	10
Positions.....	5
	<hr/> 40

(b) Medical men during their second and third months (this series of lectures repeated every two months):

Principles of interpretation.....	1	Head and dental.....	10
Stereoscopy.....	1	Orthopedic.....	5
Fluoroscopy.....	2	Therapeutics.....	2
Fractures and bone lesions.....	15	Reports and records.....	2
Heart and lungs.....	10	Duties of the Roentgenologist.....	1
Pathology (by a pathologist).....	10	Miscellaneous.....	6
Localization.....	5		<hr/> 80
Gastrointestinal.....	8		
Urinary tract.....	2		

(c) Enlisted men (this series of lectures repeated monthly):

Physics and electricity.....	15	Records and filing.....	2
Review quiz.....	5	Duties of manipulator.....	1
Dark room work.....	5		<hr/> 30
Handling of patients.....	2		

MANIPULATORS' SCHOOL

Instruction for manipulators was limited to the theory, operation, maintenance, and repair of the various types of apparatus. During the last few months only a small percentage of enlisted men were brought in contact with the large so-called base hospital machines. These were the men who, by reason of previous experience or education, were especially fitted for such instruction. Their course in the handling and caring for the portable types and induction coil outfits, and especially in the Delco engine, was very thorough.

Their instruction in position and exposure drill was limited, and given in such a way that it served more to fasten in their minds the knowledge they had gained in the machine and developing work than to make real operators of them. Anatomical terms, other than those familiar to any schoolboy, were not used, and only the more common positions were practiced.

The instructors were Sanitary Corps officers or graduates of former classes. The teaching facilities were constantly increasing, so that there was a continuous demand for practical work in the way of wiring, both low and high tension; assembling and adjusting apparatus, and installing the various machines. The manipulators under the direction of their instructors made all the changes in building T, even to building the developing counters and to mounting the extra large step-down transformer. In short, it was the purpose of the school to train them to be useful and practical assistants to medical officers, and to keep them just as far from actual professional duties as possible.

The assignments of these men in the developing course were similar to those of the officers. Their hours in the machine course were so arranged as not to conflict with the officers.

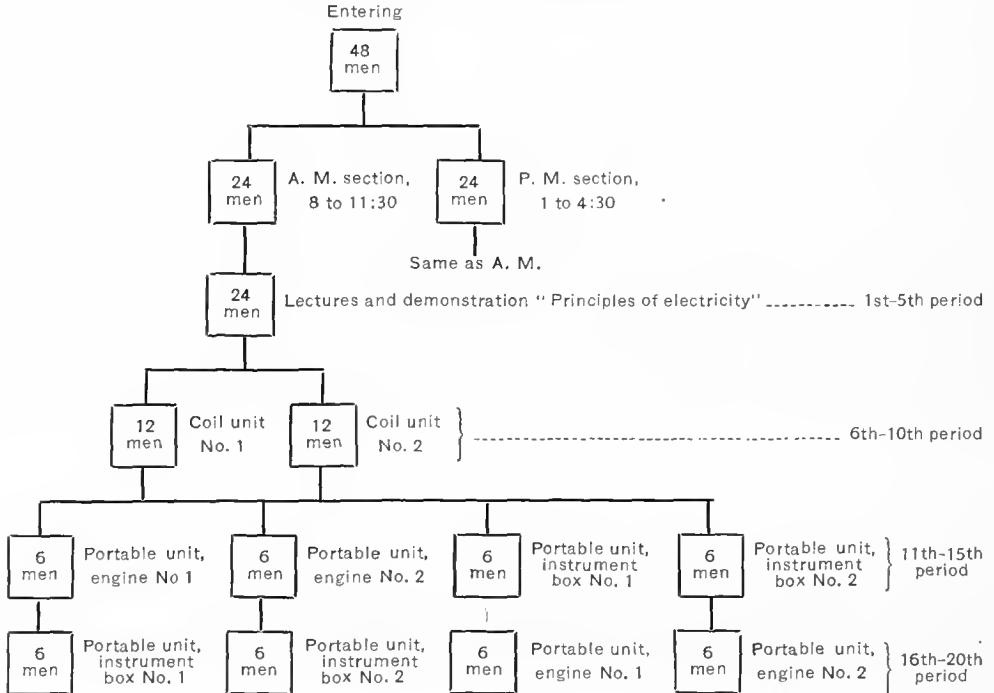

Manipulator's school schedule

	Machine course: Electricity and coil units		Machine course: Portable units		Developing and dark room		Position and exposure drill	
	8 to 11.30 a. m.	1 to 4.30 p. m.	8 to 11.30 a. m.	1 to 4.30 p. m.	8 to 11.30 a. m.	1 to 4.30 p. m.	8 to 11.30 a. m.	1 to 4.30 p. m.
First week.....	A	B			B	A		
Second week.....	B	A			A	B		
Third week.....			A	B			B	A
Fourth week.....			B	A			A	B

Section A, 24 men; section B, 24 men.

MACHINE COURSE

(Capacity: 48 men every two weeks, or 96 men per month)

SCHOOL OF ANATOMY

The school was authorized by the Surgeon General on the receipt of the following letter:¹⁵⁶

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., July 6, 1918.

From: Maj. A. S. Begg, M. R. C.

To: The Surgeon General of the Army, Washington, D. C. (through the commandant, medical officers' training camp).

Subject: Proposed School of Anatomy.

It has become evident that for the proper conduct of the professional schools at this camp it is now necessary to carry on certain instruction in anatomy. This is especially true as regards the specialties, in which at the present time individual attempts are being made to supply the needed instruction. After conference with the heads of certain special courses it is proposed to correlate and centralize this fundamental teaching.

In order to carry out the above program it is necessary to provide space, apparatus teaching material, and instructors. The commandant of this camp, in conference, pointed out the inadvisability of such an establishment within the reservation, and further inquiry elicited the fact that excellent quarters would be supplied by the University of Chattanooga, without cost to the Government.

Lieut. Robert J. Cook, M. R. C., now attached to instruction staff, is competent to assume charge of the work. The necessary additional instructors are also available, as is the necessary technical help, the latter being enlisted personnel.

The anatomical material can be obtained through the Tennessee authorities.

To properly carry out the above program, and begin at the earliest possible moment, it is requested that authority be granted to expend the sum of \$400 as follows: Construction of storage facilities, \$200; immediate purchase of chemicals, glassware and tools, \$200.

The cost of anatomical material not being determined, and the purchase of emergency supplies from time to time being necessary, it is further requested that the sum of \$200 per month be appropriated for this purpose.

It is recommended that authority requested above be communicated by telegraph.

* * * * *

A. S. BEGG.

[First indorsement]

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., July 6, 1918.

To the SURGEON GENERAL OF THE ARMY,
Washington, D. C.

Forwarded.

1. Approval recommended.

2. The proposed course in anatomy is essential for the full efficiency of the courses in surgery, orthopedic surgery, eye, ear, nose, and throat, genitourinary work and other specialties.

3. It would appear inadvisable to do any anatomical dissection in this reservation, in view of the undesirable impression sure to be made among the great number of recruits here. Having it conducted in Chattanooga, readily accessible by motor and trolley, removes these difficulties. The anatomical facilities which it is proposed to occupy were formerly used by the old Chattanooga Medical College, now defunct, for the present purpose.

4. Requisition for the necessary post-mortem instruments have been forwarded.

E. L. MUNSON,
Colonel, M. C., Commandant.

The school was originally intended to be only an integral part of the School of Military Surgery, but eventually almost every special professional school included a certain allotted time devoted to instruction in anatomy which was given at this school.¹⁵⁷

The location of the school was the first consideration. Through the efforts of the director, the laboratory of the medical department of the University of

Chattanooga, was secured for this work and a survey of the premises made. Dissecting tables were constructed, shelves and boxes prepared for the keeping of material, arrangements made with the medical supply officer for supplies to be used and for the purchase of anatomical material and emergency supplies which could not be obtained through the Quartermaster Department. An appropriation of \$200 per month was secured from the Surgeon General's Office. Later it was evident that this appropriation was too small and a larger one, of \$1,000 per month, was obtained.¹⁵⁷

Arrangements were made with Vanderbilt University to furnish material for dissection and operative work.¹⁵⁷ State laws in regard to obtaining material from the penal and charitable institutions of this vicinity were investigated, and it was found that there is an act in Shannon's Code of Laws for the State of Tennessee whereby anatomical schools are to receive unclaimed bodies from penal and charitable institutions. This was taken up with the authorities of the county and a number of bodies were received from that source. As there were so many student officers to go through this school and the scarcity of material prevented at least some of the men from doing work on the cadaver, it was apparent that it would be necessary, if every man was to have an opportunity of getting some applied operative work, to make available for them some other means. An operative and experimental course of operative surgery on the living dog was suggested. Preparations were then made, tables built, the room prepared for this work, and arrangements made to issue an order that all dogs running loose at Fort Oglethorpe should be caught for this work.

Instructors were selected for conducting this course, and from the first class in the School of Anatomy, beginning August 17, additional instructors were chosen to help conduct the work for the following class, and as each class passed through this school the best men were chosen for work with each succeeding class. To prevent the constant changing of instructors, as men were ordered to other camps, permanent instructors were assigned to the school.

The organization of a course of study whereby the student officers of the School of Military Surgery would be able to get a review of anatomy and of applied surgery as it was practiced in the war zone was perfected. A syllabus of anatomy which was to be covered by lectures, followed by demonstrations on dissected material of the regions covered by anatomy and surgical anatomy, was compiled. This course was of six days' duration. The general plan of this work on the cadaver was to divide the men in groups of 10 for each cadaver. A schedule of operations was arranged so that, by subdividing this group of 10 men into 2 groups of 5 each, one group working on the right and one on the left side of the body, in a region far enough removed not to interfere with the other group, there was very little confusion, and as the group working on either side finished an operation in the regions of the head or neck, this group was moved to the opposite side and an operation was performed on a lower extremity. Work was thus available in practically every region for every man. In their work on the cadaver, a study of the anatomy of each particular region was insisted upon and gone into in detail by the instructors assigned to this group. Owing to the scarcity of material, student officers from the different schools utilized every part of the body. The oral-plastic surgeons conducted

their course first. This was followed by classes from the School of Military Surgery, the School of Orthopedic Surgery, the School of Neurosurgery, the School of Otolaryngology, the School of Ophthalmology, and the School of Dentistry.

The following is a brief résumé of work accomplished month by month: ¹⁵⁷ Beginning August 17, 1918, a series of lectures of three days' duration was given to the class of surgery, consisting of 79 men. The work included a review of applied surgical anatomy and demonstrations of prepared specimens, skeletons, and charts. Seventeen men from this class and six men from the staff of General Hospital No. 14 were given a three-day course in operative surgery on the cadaver. After this class had finished, class No. 10, from the orthopedic school, numbering 30 men, was given a course in operations on the extremity and spine, which lasted for two days and was followed by a dissection of the extremities and back, extending over a period of eight days. Ratings of the class of the School of Military Surgery and of the class of orthopedic surgery were submitted to the directors of the respective schools at the end of the course. During the month of August 7 cadavers were obtained, only 3 of which were used, leaving 4 on hand to begin the work for the month of September.

During September a course of lectures and demonstrations of five days' duration was given to 114 men from the School of Military Surgery; of this number, 46 men were given a course of operative surgery on the cadaver and 26 men were given a course of operative surgery on the dog. In addition to this, 20 student officers from the School of Orthopedic Surgery were given a course of five days' duration, and 27 men from the School of Otolaryngology used the remaining available material for performing operations on the ear, nose, and sinuses. Four cadavers were used this month and four more were ordered from Nashville. Arrangements were perfected whereby the pauper dead of Hamilton County would be taken over for use in the school, and one body was received from the county. Five dogs were used this month for operative purposes.

The work for the month of October, on the same plan, was given to two classes from the School of Military Surgery, the first class numbering 77 men and the second class 134 men. All members of the first class were given an operative course of surgery on the cadaver and an additional 30 men were given an operative course on the dog; 6 dogs being used for this purpose. Of the second class in the month of October, 37 were given an operative course on the cadaver and 37 other men from this class were given a course in operative surgery on the dog. In this work, instrumental technique was insisted upon and the men were carefully rated by practical daily, oral and written quizzes on all work covered by lectures and demonstrations of dissected material and by operations on the cadaver and the dog. From the School of Orthopedic Surgery, during the month of October, the classes numbering 17 and 13 men, respectively, were given their course according to the plan adopted for orthopedic work. The first class devoted one week's time to the study of regional anatomy, and the second class, two weeks. Twenty-seven student officers from the School of Otolaryngology devoted three days to the study of regional

anatomy and operative work on material which had previously been used for the Schools of Surgery and Orthopedies. Nine student officers from the School of Plastic and Oral Surgery spent one day in the performance of plastic surgery about the head and one day for the performance of operations on the dog. Twenty-five student officers from the School of Dentistry spent one day in the performance of operations about the jaw and in the study of regional anatomy. Four bodies were received from the local county officials for the work during this month.

In the month of November, a class from the School of Military Surgery, numbering 83 men, reported on November 4. The general plan of lectures and demonstrations and ratings of one week's duration was given to this class and material was available for all members for operative work on the cadaver and the dog; 12 dogs being used for the purpose. On November 18 another class from the School of Military Surgery, numbering 102 men, reported and were given the same work, with the exception that no dogs were available for operative work for this class; however, every member was given work on the cadaver. From the School of Orthopedic Surgery, three classes, totaling 37 men, were given work and material on the plan adopted for the orthopedic classes. From the School of Otolaryngology, 10 men used material for operations and the study of regional anatomy. From the School of Plastic and Oral Surgery, 35 student officers spent 5 days here, 2 days of which were taken up by lectures and demonstrations and 3 days in the performance of plastic and surgical operations about the head and face. Nineteen student officers from the School of Dentistry spent two days in operative work on the cadaver and dissection of muscles, nerves, and vessels of the face. Twenty-five student officers from the School of Ophthalmology were given four hours of lecture and demonstration of dissected specimens of the brain, spine, cranial nerves, and contents of the orbit, and three hours operative work on the cadaver. Fourteen student officers from the School of Neurosurgery spent three days in the performance of operative work and dissection on the cadaver and experimental work on one live dog. During the month, the school received 3 bodies from the local and county officials and 12 bodies from Vanderbilt University at Nashville, Tenn. Only 13 of these bodies were utilized in the work, leaving 2 remaining for the work in December.

One hundred and fifteen student officers from the School of Military Surgery reported on December 2, and were given a 10-day course of lectures and demonstrations of dissected material, and operative surgery on the cadaver and the dog, eight cadavers and nine dogs being utilized in this work. Fifteen student officers from the School of Orthopedic Surgery followed out their general plan of work for two weeks, beginning December 2. Material was furnished to 80 men from the School of Dentistry for operative work and dissection in their particular region. Twenty-four student officers from the School of Otolaryngology used material for operative work on the sinuses, nose, and throat and for dissection in those regions. Fifteen student officers from the School of Plastic and Oral Surgery utilized material for the performance of plastic operations about the face. Fifteen student officers from the School of Neurosurgery spent three days here, one of which was devoted to experimental work on the live

dog and the other two on dissection of cadaver material. Sixteen student officers from the School of Ophthalmology spent one day in demonstrations and dissections and operative work pertaining to their particular region. During the month, 8 cadavers and 10 dogs were used for operative work by the different classes. On December 16, 49 student officers from the School of Military Surgery reported for a series of lectures in a review of anatomy, and 9 student officers from the School of Orthopedic Surgery reported for work in their branch of surgery. On December 17 orders were received to discontinue work in the special courses to men who had been ordered to these schools subsequent to December 10; consequently the courses were discontinued.¹⁵⁷

The following is the schedule of lectures and demonstrations:¹⁵⁷

Monday:

- A. m.----- Scalp and skull as a whole; face and neck.
P. m.----- Demonstration of above.

Tuesday:

- A. m.----- Thorax and diaphragm; shoulder, arm, foreman, and hand.
P. m.----- Demonstrations of above.

Wednesday:

- A. m.----- Pelvis, hip, thigh, knee, and leg; vertebral column and spinal cord.
P. m.----- Demonstrations of above.

Thursday:

- A. m.----- Abdominal wall, peritoneum, gastrointestinal tract, and fixed abdominal organs; genitourinary tract.
P. m.----- Demonstrations of above.

Friday:

- A. m.----- Blood and vascular system; landmarks and ligations.
P. m.----- Quiz.

Saturday:

- A. m.----- Quiz and written (final) examination.

OPERATIVE COURSE ON THE CADAVER

RIGHT SIDE

First day:

- 10 to 10.30----- Lumbar puncture—landmarks.
10.30 to 11.15----- Subtemporal decompression.
11.15 to 12----- Ligation of posterior tibial artery in middle third of leg and at the bend of the ankle.
1 to 1.45----- Lumbar nephrectomy.
1.45 to 2.45----- Ligation of femoral artery, followed by dissection of Scarpa's triangle.
2.45 to 3.30----- Ligation of brachial artery at middle third of arm and exposure of musculospiral nerve.

Second day:

- 10 to 10.45----- Guillotine amputation of foot anterior to the tibialis anticus and peroneus longus.
10.45 to 11.15----- Guillotine amputation of upper third of forearm.
11.15 to 12----- Guillotine amputation of lower third of thigh. Study of cross section of each.
1 to 1.45----- Blocking of second and third divisions of fifth nerve—landmarks.
1.45 to 2.15----- Ligation of external carotid artery—landmarks and relations.
2.15 to 3.30----- Dissection of perineum.

Third day:

- 10 to 10.30----- Tracheotomy (high and low).
- 10.30 to 11.15---- Splenectomy.
- 11.15 to 12----- Removal of foreign body from prevertebral space following posterior border of sternomastoid muscle.
- 1 to 2----- Repair of injury to diaphragm in the costophrenic sinus.
- 2 to 2.45----- Exploratory incision for gunshot wound of the abdomen.
- 2.45 to 3.30----- Ligation of the anterior branch of the middle meningeal artery.

Fourth day:

- 10 to 10.30----- Exploratory incision and suture of wound of liver.
- 10.30 to 11.15---- Osteoplastic flap over motor area and tapping for lateral ventricle.
- 11.15 to 12----- Pericardial paracentesis and explorations.

LEFT SIDE

First day:

- 10 to 10.30----- Lumbar puncture—landmarks.
- 10.30 to 11.15---- Ligation of popliteal artery and dissection of popliteal space.
- 11.15 to 12----- Laminectomy—eighth, ninth, and tenth thoracic.
- 1 to 1.45----- Suture of sciatic nerve in middle of thigh.
- 1.45 to 2.45----- Ligation of axillary artery followed by dissection of axillary space.
- 2.45 to 3.30----- Ligation of the anterior tibial artery and exposure of anterior tibial nerve.

Second day:

- 10 to 10.45----- Guillotine amputation at the wrist joint.
- 10.45 to 11.15---- Guillotine amputation at upper third of leg.
- 11.15 to 12----- Guillotine amputation of arm (supracondylar).
Study of cross section of each.
- 1 to 1.45----- Blocking of second and third divisions of fifth nerve—landmarks.
- 1.45 to 2.15----- Extraperitoneal ligation of internal iliac artery.
- 2.15 to 3.30----- Dissection of parotid gland, facial nerve and parotid portion of external carotid artery.

Third day:

- 10 to 10.30----- Suprapubic cystotomy.
- 10.30 to 11.15---- Ligation of third portion of subclavian artery—relations.
- 11.15 to 12----- Transperitoneal nephrectomy.
- 1 to 2----- Exposure of cervical brachial plexus—relations.
- 2 to 2.45----- Ligation of lingual artery—relations.
- 2.45 to 3.30----- Herniotomy (Andrew's method).

Fourth day:

- 10 to 10.30----- Ligation of posterior branch of middle meningeal artery—landmarks.
- 10.30 to 11.15---- Thoracotomy. Resection of rib, evisceration and repair of lung wound.
- 11.15 to 12----- Ligation of facial artery and complete dissection of side of face.

COURSE IN OPERATIVE SURGERY ON THE DOG

First day:

1. Blood transfusion, citrate method; typing blood.
2. Arterial suture (femoral artery) for injury to vessel wall.
3. Resection of the intestine, with end to end anastomosis, Connell stitch.
4. Splenectomy for hemorrhage, with discussion of danger points.
5. High tracheotomy.
6. Evisceration of the lung, with mattress suture to control hemorrhage; intratracheal insufflation anesthesia.
7. Subtentorial decompression.
8. Guillotine amputation of the thigh, with quiz on cross section.

Second day:

1. Lateral anastomosis of the small intestine.
2. Enterorrhaphy for penetrating wounds of intestines and stomach.
3. Suture for liver hemorrhage, using omentum and rectus muscle.
4. Transabdominal nephrectomy for hemorrhage.
5. Lumbar nephrectomy.
6. Suprapubic cystotomy.
7. Pericardiorrhaphy for stab wound or foreign body.
8. Decompression of Rolandie area.

Demonstrations were given of the following: Bones of head and face; head, trepanation landmarks, arteries, and motor area; base of skull; dura mater and sinuses; lateral and medial surface of brain; base of brain; facial nerve and artery, parotid gland, Steno's duct, superficial structures and triangles of neck; branches fifth nerve, landmarks for blocking internal maxillary artery; sagittal section, skull and face; deep vessels of neck and branches; nerves of neck; pharynx, larynx, trachea, and esophagus; cross section of neck at base of skull; cross section root of neck; sympathetic nerve system; spinal cord; osteology of spinal column; osteology of the upper extremity as a whole; brachial plexus; axillary space; shoulder joint, muscles, and ligaments; elbow and wrist joints and ligaments; muscles and nerves and vessels; muscles of forearm; nerves and vessels of forearm; muscles, nerves, and vessels of hand; musculospiral, median, radial, and ulnar nerves, with vessels; lungs and pleura; heart and pericardium; diaphragm and aorta; intestinal tract and fixed organs; viscera of pelvis and internal iliac artery; ligaments around pelvis and hip; ligaments of knee and ankle joint; hip flexors; nerves and vessels of thigh; nerves and vessels of leg and foot.

OPERATIVE COURSE IN ORTHOPEDIC SURGERY

Tenotomy of tendo Achillis.

Tendon lengthening—open method.

Removal bone-graft from shaft of tibia—save for Albee operation.

Astragalectomy—as a foot stabilizer.

Transplantation of peroneals to act as dorsal flexors of foot.

Knee—anterior median incisions—removal of portion of external semilunar cartilage.

Dislocation of patella—use of ligamentum patellæ to prevent.

Transplantation biceps and semimembranosus or sartorius.

Fasciotomy of hip for hip flexion contracture.

Osteotomy lower end of femur.

Nerve suture—sciatic, musculospiral, brachial plexus.

Tendon fixation at ankle.

Arthroplasty at hip.

Fracture of humerus with bone splinting.

Arthrotomy of shoulder.

Excision of bones of wrist.

Resection of elbow joint—subperiosteal.

Laminectomy.

Hibbs spine operation or Albee.

Drainage of osteomyelitis.

Transplantation of triceps.

Transplantation pronator radii teres.

Dissection of extremities and back.

Number of men belonging to the different classes that passed through the School of Anatomy:¹⁵⁷

School of Military Surgery.....	704
School of Orthopedic Surgery.....	132
School of Dentistry.....	124
School of Otolaryngology.....	88
School of Plastic and Oral Surgery.....	59

LABORATORY SCHOOL

This school was ordered established by the following letter:¹⁵⁸

JANUARY 19, 1918.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: School for training of laboratory specialist officers.

1. A school for the training of medical officers as specialists in laboratory work will be established as part of the general scheme of instruction carried out in the Medical Officers' Training Camp, Fort Oglethorpe, Ga.

2. The purpose of this school is to train medical officers for laboratory work by military methods for military purposes; and coincidently to develop them physically and train them in subjects which they should know under the conditions under which they would practice their specialty, including organization, paper work, applied military hygiene and sanitation, handling of enlisted men, and general functions as officers.

3. Classes will be arranged on a basis of a two months' course.

About 20 officers trained as laboratory officers will be required monthly.

It is proposed to supply the entire needs for laboratory workers for the Army through this school.

4. The school for the training of laboratory workers will serve as the department laboratory, Southeastern Department, and perform all the duties heretofore devolving on the latter.

5. The school for the training of laboratory workers will affiliate with the base hospital, and receive advantage of its facilities, for all necessary professional purposes.

For research work, testing of apparatus, training of special men and similar purposes, it will also affiliate with the Camp Greenleaf School of Applied Hygiene and Sanitation.

6. The general professional instruction to be given will relate to laboratory methods and technique as adapted to military conditions and purposes.

7. It is intended to erect a laboratory building convenient to the general hospital, removing thereto all personnel and equipment of the department laboratory now at Atlanta.

This laboratory will serve the functions of—

(a) Laboratory for the general hospital.

(b) Department laboratory.

(c) Training school for laboratory workers.

8. (a) The senior instructor for this school detailed by this office on the staff of instructors of the training camp will, under the commandant thereof, be in direct charge of the course.

(b) He will continuously investigate the qualifications and suitability for laboratory service of medical officers, and others, under instruction.

(c) As director of the department laboratory, and for all laboratory work other than that of training, he will be responsible directly to this office.

9. It is intended to construct barracks for 100 medical officers and for 100 enlisted men under instruction in this school.

These barracks will be part of the medical officers' training camp.

10. Officers under training in this course will be organized as a special company, be quartered in the medical officers' training camp, and be subjected to its discipline at all times.

11. Hours of instruction, participation in joint classes, etc., will be arranged by the commandant of the training camp.

12. The schedule for the first month will be as follows:^b

* * * * * *

SPECIAL SUBJECTS

The details of this part of the course, including organization, equipment, supply, use, and administration of fixed and mobile laboratories, will be arranged by you, after conference with the officer assigned by this office in charge of the course; 56 hours.

14. Following the basic instruction given in the first two months as above, special training over a variable period of time will be continued by personnel under instruction.

It is contemplated to keep a reserve under training at all times, and for such periods as their services may not be required elsewhere.

This special training will be prescribed by the officer in immediate charge of instruction under this course.

15. A number of selected enlisted men of the Medical Department, not exceeding 100 at any one time, will be kept at your camp under instruction. They will be organized as a special company and be under the discipline of the training camp at all times.

All such will be given such part of the basic course for enlisted men at your camp as might be of advantage to them in such service.

The scope of their special training in laboratory work, to be given during the first two months of training, will be prescribed by you after conference with the officer designated as in direct charge of the work.

16. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON,
Colonel, Medical Corps.

In carrying out the instructions given in this letter, a school for bacteriology and pathology specialists and a school of pathology were established,¹⁵⁹ constituting the laboratory school. The school progressed very slowly, the accommodations allotted being limited and providing for a class of only 10 officers and 20 enlisted men.¹⁶⁰ In July the school was closed for a while, as there were no student officers to instruct.¹⁶¹

In October, 1918, the school was moved to another building, occupying one complete company barrack. This gave ample space for the instruction of all the officers assigned and also for 60 enlisted technicians monthly. When the armistice was signed the school was well under way with a full quota of students. Unfortunately, as most of the enlisted men were medical students, they were discharged shortly after the armistice by orders from the War Department.

A complete syllabus was compiled when the laboratory school was first started, and instruction was carried on according to this.¹⁶² The following schedules show in detail how the instruction for each week was divided.^{163 164}

^b See pp. 78, 79.

Laboratory course for student officers, July 2 to 31, 1918

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 11.30 a. m.	Pathology	Clinical microscopy	General bacteriology	Clinical microscopy	Vaccine therapy	Serology
1.30 to 4 p. m.	Biological chemistry	General bacteriology	Serology	Biological chemistry	Epidemiology	

Laboratory course for enlisted men, July 2 to 31, 1918

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 11.30 a. m.	Lectures and practical work in bacteriology	Lectures and practical work in the preparation of culture media	Lectures and practical work in blood examinations	Lectures and practical work in urinalysis	Lectures and practical work in bacteriology	Lectures and practical work in Government property
1.30 to 4 p. m.	Lectures and practical work in the collection of specimens for laboratory examination	Lectures and practical work in urinalysis	Lectures and practical work in feces examination	Lectures and practical work in the collection of specimens for laboratory examinations	Lectures and practical work in feces examination	

Laboratory schedule for course of instruction for enlisted men, November 25, 1918

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 11.30 a. m.	Bacteriology	Bacteriology	Serology	Parasitology	Bacteriology	Bacteriology
1.30 to 4 p. m.	Clinical microscopy	Chemistry	Clinical microscopy	Chemistry	Clinical microscopy	

SCHOOL OF NUTRITION

The following letter directed the organization of a school of nutrition at Camp Greenleaf: ¹⁶⁵

MARCH 7, 1918.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: School for officers of the division of foods and nutrition, Sanitary Corps.

1. A school for officers of the division of foods and nutrition, Sanitary Corps, will be established as part of the general scheme of instruction carried out in the Medical Officers' Training Camp, Fort Oglethorpe, Ga.

2. The purpose of this school is to conduct the training of these officers of the Sanitary Corps along military lines, from the military viewpoint, and in the military environment; and coincidentally to develop them physically and train them in subjects which they should know under the conditions under which they would practice their specialty, including organization, regulations, paper work, relations with enlisted men, and their general functions as officers.

3. About 20 graduate food experts of the sanitary division are required monthly.

Classes should be arranged on the basis of a course lasting two months.

4. The senior instructor for this school, detailed by this office on the staff of instructors of the training camp, will, under the supervision of the commandant thereof, be in direct charge of the course.

In addition to his educational duties, he will continuously investigate the qualifications and suitability of officers and enlisted men under instruction.

5. The routine of all matters relating to food, messing, and nutrition in the various organizations at your camp will, as far as possible, be demonstrated and utilized as part of the subjects of instruction.

6. The general technical instruction to be given will relate to matters having to do with food and nutrition, and is briefly outlined in this letter of instructions.

The necessary details will be furnished by the food division, this office.

The course of instruction, based thereon, will be prescribed by the commandant, medical officers' training camp, after conference with the senior instructor of the school.

7. The course in general training, together with food work, will cover a minimum of two months. That part of the course relating to food work will comprise a total of 110 hours.

8. Officers under training as specialists in food and nutrition work will be organized as a separate organization or detachment, will be quartered and subsisted in the medical officers' training camp, and be subjected to its discipline at all times.

9. Hours of instruction and participation in joint courses will be arranged by the commandant of the training camp.

10. The schedule of the first month is as follows: ^b

*	*	*	*	*	*	*
SPECIAL						Hours
The principles of nutrition.....						20
The physiology of digestion.....						5
Food economy.....						5
Total.....						30

11. The schedule of the second month is as follows: ^b

*	*	*	*	*	*	*
SPECIAL						Hours
Composition of foods.....						10
Fundamentals of mess cooking.....						15
Food inspection.....						20
Mess accounting.....						5
Mess management.....						10
Nutritional surveys.....						20
Total.....						80

12. A number of enlisted men will be kept at your camp under training to assist in food work. This number will be later announced.

All should be given such part of the basic course of enlisted men at your camp as might be of advantage to them in such service. The score of their special training in food work will be prescribed by you after conference with the senior instructor in charge of the course in food work.

13. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON,
Colonel, Medical Corps.

Before this school was established according to these instructions, the division of food and nutrition was communicated with and asked to present a memorandum outlining the special features of such a course.¹⁶⁶

^b See pp. 78, 79.

The following syllabus was the result of this correspondence:¹⁶⁷

SYLLABUS OF INSTRUCTION COURSE FOR NUTRITION OFFICERS AT CAMP GREENLEAF

I. COMPOSITION OF FOODS

(Fifteen lectures of one hour each; textbook, Sherman's Food Products)

1. Definition of food; essential elements (protein, fat, carbohydrates, mineral salts, accessories, water); caloric value of food elements.
2. Milk; evaporated milk; dried milk; reconstructed milk (homogenizer and emulsor); skimmed milk.
3. Dairy products (other than milk) and eggs (cream, cheese, buttermilk, ice cream); eggs (cold storage, frozen, dried).
4. Meat and meat products (meat, poultry, fish, shellfish); fresh, cured, refrigerated, frozen, dried, canned, dehydrated.
5. Bread and flour; grades of wheat flour; flour substitutes (sweet-potato flour, cottonseed flour, soy-bean flour, alfalfa flour, peanut flour).
6. Cereal products; breakfast foods; alimentary pastes; package versus bulk cereals.
7. Vegetables; high-protein starch; canning, preserving, drying dehydration; extent of canning industry.
8. Fruits and nuts; canning, preserving, drying; importance of fruit acids.
9. Edible fats and oils (butter, oleomargarine, nut margarine, nut butters, lard and lard substitutes, cottonseed oil, olive oil, coconut oil, corn oil, peanut oil, soy-bean oil).
10. Saccharine products (cane sugar, beet sugar, invert sugar, maple sugar, honey, molasses, sirups, glucose, jam, jelly, preserves, marmalade).
11. Coffee, tea, cocoa, and chocolate.
12. Soft drinks (cola preparation, near beers, pops, so-called tonics).
13. Spices and condiments (vinegar, ketchup, pickles, salt, extracts).
14. Food preservatives, their use and abuse (salt, vinegar, smoke, benzoic acid, boric acid); prohibited preservatives (formaldehyde, salicylic acid, sulphites, phenol, abradol, formic acid, fluorids); artificial sweeteners (saccharin, dulcin, etc.); artificial colors (mineral, vegetable, coal-tar).
15. Confectionery.

To be supplemented by charts and samples of pure and adulterated foods.

II. THE PHYSIOLOGY OF DIGESTION

(Major Carlson's lecture, Howell's Physiology)

	Hours
1. The motor phenomena of the alimentary tract, nervous control of.....	1
2. The sensations of the alimentary tract (flavor, appetite, hunger) and the nervous control of secretions.....	1
3. Digestion in the stomach.....	1
4. Digestion in the intestines.....	1
5. Absorption and utilization of food.....	1
(Diagrams of alimentary tract.)	

III. THE PRINCIPLES OF NUTRITION

(Textbook, Lusk's Science of Nutrition—part)

1. Calorimetry, direct and indirect.....	3
2. Fasting as a basis of nutritive requirements.....	2
3. The maintenance of body temperature as a basis of energy requirements.....	2
4. The influence of protein on metabolism.....	3
5. The influence of fat on metabolism.....	1
6. The influence of carbohydrate on metabolism.....	2
7. The influence of muscular work on metabolism.....	1
8. What is the normal diet.....	2
9. The accessory substances in the food.....	1
10. Food requirements for growth.....	2
11. Food economics.....	1

(Charts: Milner apparatus; bomb calorimeter; standard portions).

IV. FUNDAMENTALS OF MESS COOKING

(The Manual for Army Cooks)

1. The rations of the United States Army; rations of different allied armies.....	1
2. Construction of menus or bills of fare; ration balancing; a mechanical device for checking the proper distribution of nutrients.....	3
3. Kitchen equipment for permanent camps and for field service.....	2
4. Actual experience in kitchen, as kitchen police, assistant cook, and cook.....	10
(Set apart a kitchen especially for food division which will be a model in every respect.)	

V. MESS MANAGEMENT AND ACCOUNTING

(Manual for Army Cooks and Manual for Mess Officers)

1. Mess sergeant's duties, actual experience in mess accounting.....	3
2. Mess officer's duties, actual experience.....	3

VI. PROTECTION OF FOOD AGAINST SPOILAGE AND DETERIORATION

1. The general phenomena of spoilage; fermentation, putrefaction; causes.
2. Cold storage; applicability, principles involved, results.
3. Dehydration; applicability, principles, results, microbic survivors.
4. The use of preservatives; salt, sugar, smoke, etc.; Pasteurization.
5. Sterilization by heat; canning, intermittent heating, cold pack, etc.

VII. FOOD INSPECTION

(Leach's Food Inspection and Analysis)

- A. Didactic:
 1. Inspection of vegetables and vegetable products, molds, rots, etc.
 2. Inspection of breadstuffs, cereals, rice, etc.
 3. Inspection of beef, hams, and other fresh or cured meat products.
 4. Inspection of canned goods, milk, fruits, meats, vegetables.
 5. Inspection of vinegar, ketchups, etc.; five hours laboratory demonstration.
- B. Practical:
 1. Inspection of quartermaster stores at camps adjacent; five hours.
 2. Inspection trips to refrigerators and storage warehouses in Chattanooga.

VIII. NUTRITIONAL SURVEYS

(Orders to party leaders)

- A. Didactic:
 1. Purpose of nutritional surveys: To study food consumption; to study food waste.
 2. Relations with officers of the camp (commanding officer, division surgeon, sanitary inspector, regimental surgeon, company commanders, mess officers).
 3. Methods employed; inventories; accession to stock; methods of weighing.
 4. Separation of garbage and reclamation; weighing and sampling; standards to be enforced (?).
 5. Computation of food consumption and waste.
- B. Practical:
 1. Application of methods to individual messes in actual surveys.
 2. Possibly start a piggery. Weigh garbage and weigh animals.

This school was started September 3, 1918, according to the instructions received, and the special nutritional instruction was based on the above syllabus. Some instruction along this line had been given since June 1, 1918. Naturally, this being a new method of teaching nutritional work, many changes in subjects and methods of instruction, even in the short life of the school, were made.^{168 169 170}

It was found that the time allotted to this instruction was entirely too short and on that account the officers were not sufficiently prepared before leaving the school. This condition of affairs called forth the following:¹⁷¹

SCHOOL OF NUTRITION, CAMP GREENLEAF,
Chickamauga Park, Ga., November 4, 1918.

From: Capt. R. J. Anderson, Sanitary Corps.

To: The Surgeon General, United States Army, Washington, D. C.

(Attention Lieutenant Colonel Murlin, through commandant).

Subject: Improving the course of instruction for nutrition officers.

1. In addition to the basic course of instruction given in this school, it would seem that some more practical work along the lines of nutrition in the Army would be very desirable, before our officers are sent to permanent posts. In this connection I would suggest, after completing the basic course, which includes a review of the composition of foods, physiology of digestion, metabolism, principles of nutrition, mess and food inspection, waste studies, and nutritional surveys, as outlined in my letter of October 1, 1918, that our men be detailed as assistants to mess officers in the various units in this camp. I believe that arrangements could be made through the commandant with the various organizations such as the hospital, medical officers' training camp, or training battalions to place officers from this school on duty with the mess officers in the different units mentioned above.

2. An extension of the work of student nutrition officers as suggested above would necessitate that their stay in this camp was prolonged possibly two weeks. If this extension of the time of training can possibly be arranged, I think that it would be well worth while in view of the greater experience that the officers would receive. At the end of the additional training they would have a more intimate knowledge of mess conditions and the problems connected with the handling of messes, menus, and mess accounts than it is possible for them to obtain under present conditions.

3. If necessary I will endeavor to cut the time of the basic course to four or five weeks. Then the men will be placed as assistants to the food inspector which we hope to establish and following that they will act as assistants to mess officers. The proposed time arrangement will be as follows: Military training, 2 weeks; basic school course, 5 weeks; food inspection, one-half week; mess officer, 1 or 2 weeks.

4. Please let me know if this plan meets with your approval so that necessary arrangements may be made with the camp authorities for the extension of our work.

R. J. ANDERSON,
Senior Instructor, School of Nutrition.

[Second indorsement]

SGO 353 Nutrition, Camp Greenleaf.

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
November 11, 1918.

To Capt. R. J. ANDERSON,
*Sanitary Corps, Nutrition School,
Camp Greenleaf, Chickamauga Park, Ga.
(Through commandant).*

1. The plan for giving more practical work to the students at the School of Nutrition is approved. By reason of the urgent demand for officers, it may not be possible in all cases to extend the time of training by two weeks, and it is thought that the suggestions conveyed in paragraph 3 "to cut the time of the basic course to four or five weeks" would be wise.

By direction of the Surgeon General:

CASPAR W. MILLER,
Major, Medical Corps, Division of Food and Nutrition.

Unfortunately for this instruction, the school was closed December 12, 1918,¹⁶⁸ only a short time after this letter was written and the authority asked for therein received. Fifty officers received instruction in this school.¹⁶⁸ The

instruction which was given just before the final closure of the school was divided into three periods:¹⁷⁰

First period (two weeks).—On arrival in camp the new officers were assigned to one of the companies in Battalion 11 and received the general instruction given to all officers of the medical officers' training camp, consisting of about four hours of military drill per day and the remainder of the time studying Army Regulations, Manual for Courts-Martial, etc., and attending the general lectures for all officers of the group. A quiz period of one to two hours per day was held to cover the work of the previous day.

Second period (two weeks).—At the beginning of the third week the student officers were relieved from afternoon drill and from the attendance upon the general lectures and quizzes and reported to the School of Nutrition for their technical training in nutrition. Three or four introductory lectures were usually given, covering the work that nutrition officers would be expected to do, various problems that would confront them in different types of camps, and the general methods of going about the work to overcome difficulties. One or more lectures were given covering the organization and management of the Army mess, the duties of mess officers, and the position of the mess sergeant. The various members of the class were then assigned subjects upon which to report. These subjects covered different phases of the following general headings and usually in the order given: (a) Carbohydrates, their composition, sources, uses in the body, etc.; (b) proteins, composition, sources, uses in the body; (c) fats, composition, sources, uses in the body; (d) mineral constituents of foods; (e) vitamins, their importance in the Army diet; (f) acid-base balance of the ration.

The textbooks which were most used as sources of information by the students were the following: Chemistry of Food and Nutrition, by Sherman; Food Products, by Sherman; Physiological Chemistry, by Mathews; and The Science of Nutrition, by Lusk. Practically all the technical work given is taken up rather thoroughly in one or the other of these textbooks.

During the second two weeks of the course the work was quite theoretical, but no opportunity was overlooked to connect theory and practice. In addition to the work of the classroom, two or three half-day periods were devoted to mess inspections. Usually the student officers were grouped in pairs and each pair told to inspect two to four messes and write reports giving criticisms and suggestions for changes. Prior to the beginning of this work a lecture was given on how to properly inspect a mess, good and bad features to look for, and the methods to be used in getting changes made.

Another very important assignment during this period was to prepare an Army menu for 100 men for 10 days, giving the quantities of ingredients to be used in each dish. When completed, the ration for the 10-day period must not cost above the Government allowance and must be approximately balanced in protein, fat, and carbohydrates. There must also be sufficient calcium present, and the acid-base balance must be neutral or an excess in favor of the base. The preparation of this menu involved a lot of practical work and was one of the best methods of getting a new officer acquainted with just what an army menu should look like, and of course he then knew how to criticize the ones present in the messes that he inspected later.

Third period (two weeks or longer).—At the beginning of the fifth week of the course the students were relieved from all military duty and were assigned in groups of two to four to run waste studies on various messes in camp. Each group studied one particular mess for a given period, usually two to three days. The primary purpose of this work was to get the student intimately acquainted with a mess and to enable him to see how it was managed, how the cooking was done, etc. Incidentally, he got data on the amount and kinds of waste and learned how to reduce it to the minimum. Following the waste study, the party usually remained in the same mess for three to seven days longer to carry on a food survey. The following points are among the most important determined by the food survey: (a) Total calories consumed per man per day; (b) calories wasted per man per day; (c) number of calories derived from each of the three constituents, protein, fat, and carbohydrate; (d) cost of food per man per day; (e) cost of waste per man per day; (f) points of general criticism and suggestions for changes.

During the period of the food survey at least one of the students of the party was present in the mess at all times to get the weights of incoming supplies, weights of ingredients used in cooking, amounts of waste, and to note any items of interest. The constant contact with the mess operations was the only way to learn how a mess should be managed. If time permitted, at least two of these surveys were completed before the work of the student was complete.

The work was as well outlined as could be desired and gave a good combination of the theoretical and the practical. The men who passed through the school during the fall, almost without exception, knew the theoretical side of foods very well upon arrival in camp, but a large number of them, after completing the course and reporting for duty elsewhere, were handicapped because they were not thoroughly familiar with the practical side of different types of Army messes. Of course, it was impossible in such a brief time to give the new officer a thorough knowledge of military life and also to acquaint him with all phases of mess management. However, the aim was to emphasize the theoretical less and the practical more.

DENTAL SCHOOL

The Dental School was authorized by the following letter from the Surgeon General:¹⁷²

FEBRUARY 1, 1918.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Oglethorpe, Ga.

Subject: School for training officers of the Dental Corps.

1. A school for officers of the Dental Corps will be established as part of the general scheme of instruction carried out in the Medical Officers' Training Camp, Fort Oglethorpe, Ga.

2. The purpose of this school is to train officers of the Dental Corps along military lines, from the military viewpoint, and in the military environment; and, coincidentally, to develop them physically and instruct them in subjects which they should know under the conditions under which they would practice their specialty, including paper work, organization, relation to enlisted men, and general functions of officers.

3. Classes will be arranged on a basis of a course covering two months. About 80 trained dental surgeons will be required monthly.

It is intended that all newly appointed officers of the Dental Corps shall receive this course, together with such others as the needs of the service will permit of taking it.

4. The school for the training of officers of the Dental Corps will maintain and operate a dental clinic and dental laboratory for all the troops at Chickamauga Park, including the personnel of the general hospital, utilizing the clinical material available for purposes of practical dental instruction.

5. Where necessary, as for X-ray work, surgery of the face and jaws, and for other purposes, the school for officers of the Dental Corps will affiliate with other professional schools and courses maintained as part of the Medical Officers' Training Camp, Fort Oglethorpe.

6. It is intended to erect a special building for practical clinical and laboratory purposes relating to the dental service, as well as for instruction purposes.

7. The senior instructor for this school detailed by this office on the staff of instructors of the training camp will, under the commandant thereof, be in direct charge of the course.

He will continuously investigate the qualifications for the dental service of officers and others under instruction.

8. The general professional instruction to be given will relate especially to the care and treatment of the teeth and conditions dependent thereon.

9. Officers of the Dental Corps will be organized as one or more special companies, be quartered in the medical officers' training camp, and be subject to its discipline at all times.

10. Hours of instruction, participation in joint classes, etc., will be arranged by the commandant of the training camp.

11. The schedule for the first month is as follows: ^b

* * * * *

SPECIAL DENTAL SUBJECTS

Dental supply table; nature, care, and replenishment of supplies.

Motor dental ambulances; their equipment and management.

Dental laboratory organization; fixed and field.

Organization and management of department, division, and cantonment dental service.

Limitations of dental practice in the military service.

Practice of operative and prosthetic dentistry in the military service.

Minor dental oral surgery.

Conductive anesthesia.

Interpretation of radiographs.

Wound infections.

Other subjects not specified.

Total special subjects, 110 hours.

Time apportioned to each of the above special subjects to be fixed by the commandant, after conference with the officer in charge of the school for the Dental Corps.

13. The dental division will establish and maintain one or more mobile dental ambulances for purposes of training at your camp.

14. A number of enlisted men of the Medical Department will be maintained at your camp for training with a view to their assignment to duty as assistants to officers of the Dental Corps. This number will be announced later. It will probably be about the same as the number of dental surgeons under instruction.

All such should be given such part of the basic course for enlisted men as would properly form part of their general training for such special service. The scope of their special training in dental work will be prescribed by you.

15. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON,
Colonel, Medical Corps.

^b See pp. 78, 79,

The school was organized in March, 1918.¹⁷³ The first month of the instruction of dental officers consisted of the basic course given for medical officers. While dentists received a certain amount of instruction during this month that was perhaps not absolutely necessary, it was, in the main, excellent, especially as dental officers had been called upon frequently abroad to take the place of medical officers in the field, the instruction they had received during this first basic month, it is believed, making this possible. Universal satisfaction was expressed by dentists leaving camp because of the fact that they had received an introduction to the service and at least a slight knowledge of the operation of other branches.¹⁷⁴

The instruction to be given in the second month of training was as follows:¹⁷⁵

SECOND MONTH

FIRST WEEK

	Hours
Setting-up exercises, drills, and marches.....	10
Manual for Courts-Martial and Military Law.....	2
Sanitary service.....	1
Rules of land warfare.....	1
Duties of the dental surgeon.....	1
Dental supplies and supply table.....	1
Special subjects:	
Syphilitic lesions of the mouth.....	1
Baeteriology, general.....	2
Bacteriology, laboratory, practical.....	4
Inflammation, inception and termination; immunity, etc.....	2
Dental caries, theory of.....	1
Prosthetic dentistry, theory.....	1
Principles of surgical cleanliness, sterilization, etc.....	2
Anesthesia, local, general consideration, drugs used.....	1
Oral surgery, theory.....	2
X ray, theory.....	2
Root canals, pathology.....	4
Root canals, treatment.....	4
Root canals, filling.....	4

SECOND WEEK

Setting-up exercises, drills, and marches.....	10
Manual for Courts-Martial and Military Law.....	2
Rules of land warfare.....	1
Organization of Medical Department and hospitals.....	1
Special subjects:	
Theory of focal infection.....	2
Bacteriology, general.....	2
Bacteriology, laboratory, practical.....	4
Inflammation, special, dental.....	2
Prosthetic dentistry, theory, splints and wiring.....	2
Anesthesia, infiltration, and conductive, theory.....	2
Oral surgery, theory.....	4
X ray, theory.....	4
X-ray interpretation, practical.....	4
Apicectomy, theory.....	2
Exodontia, theory.....	2
Diseases of oral cavity.....	2

THIRD WEEK

	Hours
Setting-up exercises and drills.....	10
Poison gases, practical.....	2
Special subjects:	
Plastic surgery.....	2
Bacteriology, dental.....	2
Bacteriology, dental, laboratory, practical.....	4
Cavity preparation, (Blacks).....	1
Written examination (pathology, bacteriology, anesthesia, etc.).....	3
Dentistry, prosthetic, practical, splint making.....	4
Anesthesia, infiltration and conductive, practical.....	4
Exodontia, practical.....	Unlimited.
Apicoectomy.....	Unlimited.
General review.....	4
Written examination.....	4

FOURTH WEEK

Setting-up exercises, drills, and marches.....	10
Cavity preparation, practical.....	Unlimited.
Prosthetic dentistry, practical (splints and wiring).....	Unlimited.
Anesthesia, local, clinical.....	Unlimited.
Exodontia, clinical.....	Unlimited.
Root-canal treatment and filling, clinical.....	Unlimited.
X ray, clinical.....	Unlimited.

Under operative dentistry a rather extensive course was given in the proper treatment and filling of the canals of pulpless teeth and the proper preparation of cavity and filling material.¹⁷⁴ For all practical work the classes were divided into sections, and ample clinical material was furnished each student officer.

In oral surgery no effort was made to instruct students in the actual surgery of a given case, but rather in the prosthetic appliance the oral surgeon would probably need. In this the school was handicapped until the middle of the summer of 1918 because of lack of information coming from the hospitals in France regarding just what they had found to be good and what they had discarded. There had never been any adequate and comprehensive instruction along these lines, as never before had it been necessary, and the few mechanical appliances that had been described in the professional literature of the past were awkward and known to be inefficient for this emergency. However, late in the summer, the school began teaching the form of prosthesis that was being used in France; e. g., case silver, banding, wiring, etc.¹⁷⁴

In dental radiography the student officers were taught the practical operation of the X-ray machine and film interpretation.¹⁷⁴

Pathology consisted of lectures having to do with oral infections and placing particular stress on the theory of focal infection.¹⁷⁴

The school was closed December 24, 1918.¹⁰⁶

VETERINARY TRAINING SCHOOL

This school was organized February 15, 1918.¹⁷⁵ The first class consisted of 44 student officers. These officers were combined into one company of the training group and this was given the number 27 and made part of the 7th Battalion.¹⁷⁶ At first most of the instructors were selected from the best qualified student officers, but later special instructors in addition to these were

provided.¹⁷⁷ All officers on reporting were examined professionally and classified. This gave an excellent idea of the capabilities of the students from a professional standpoint.¹⁷⁵ The post veterinary hospital and all stables in the camp were put at the disposition of this school for instruction purposes. A vacant mess hall made an improvised classroom. At first the basic instruction was given with the medical officers of the training group; this necessitated the veterinary officers receiving a great deal of instruction which, though useful, was not pertinent to an intensive course during war.

The status of the instruction six weeks after the organization of the school can be shown very clearly in the following letter:¹⁷⁶

WAR DEPARTMENT,
OFFICE OF THE SURGEON GENERAL,
Washington, April 4, 1918.

From: David S. White, major, V. C., N. A., War Department, Surgeon General's Office.

To: Acting Director, Veterinary Service, United States Army.

Subject: Report on instruction given veterinary officers, Camp Greenleaf, Ga., March 6 to 30, 1918.

1. Pursuant to a special order, I reported to the commanding officer, Camp Greenleaf, Ga., March 6, 1918.

2. The 27th Company of the 7th Battalion is composed of veterinary officers only, of whom there were 52 at this date. Fifty were second lieutenants in the Veterinary Reserve Corps, two were majors in the National Army.

3. As with all officers under instruction at this camp, veterinary officers are disciplined as privates. They are not allowed to wear rank marks. If, however, they attain, through proper attention to duty, the grade A, B, or C, certain privileges, such as permission to leave camp, wear insignia of rank, etc., on Saturday afternoons and Sundays, are accorded.

4. The company officers and noncommissioned officers are selected from those of the company who show the greatest military aptitude.

5. The daily routine to which veterinary officers are subjected, while strenuous, is excellent for building up the men morally, mentally, and physically. Through lectures, recitations, demonstrations, and quizzes the mind of the officer is kept continuously at work, and through setting-up exercises and drills, both foot and mounted, the body is maintained in condition.

6. Most of the officers gain in weight, color, brightness of eye, and alertness of step, and constipation, anorexia, insomnia, and disinterestedness soon disappear.

7. While each day's routine differs in detail, the officer is kept busy from reveille to taps with something which makes for better discipline and greater military efficiency.

8. Depending on deportment, attention to duty, professional scholarship, military bearing, alertness, etc., the officers are classified as follows: Class A, exceptional; B, above average; C, average; D, below average.

9. The officers of the camp are inspected each week by the commanding officer, and the company receiving the highest score is permitted to fly a special distinguishing flag until it is won by some company at a subsequent inspection. The veterinary company won this flag the second week in camp, which record to date has not been equaled.

10. Until my arrival no provision had been made to give instruction in veterinary matters. While all of the instruction received was of undoubted value, some of it was irrelevant, as it pertained to human beings and not animals.

11. Through the energy of the battalion commander and the courtesy of the officer in charge of instruction at the camp, as many hours as could be spared each day from the prescribed course of lectures, selecting hours at which irrelevant subjects occurred, were allotted for instruction in veterinary matters. Thus from one to three hours daily became available for this work. A classroom was improvised out of a vacant mess hall.

12. The instruction in veterinary matters given consisted in:
 - (a) Lectures, recitations, and quizzes covering S. R. No. 70.
 - (b) Lectures, recitations, and quizzes covering the guide for veterinary officers.
 - (c) Lectures on tables of organization (veterinary).
 - (d) Lectures, recitations and quizzes on blank forms, tags, etc., of the Veterinary Corps.
 - (e) Lectures on supplies and equipment of veterinary units.
13. About 32 hours were devoted to this work.
14. On March 20, 1918, Capt. W. J. Stokes, V. C., N. A., relieved me.
15. Conforming with verbal instructions, I remained with Captain Stokes long enough to assist him in getting started.
16. Returned to my home station, War Department, Surgeon General's Office, supply division, March 30, 1918.
17. With possible betterments in view the following recommendations are made:
 - a. All veterinary officers, whether just joined or of longer service, should be sent to Camp Greenleaf or a similar camp for instruction.
 - b. The curriculum should be arranged so that a certain percentage of the officers (when feasible, selection from the higher grades) may be sent out into the field at stated intervals (say, once every two weeks) and their places filled with officers who have had field service only.
 - c. The location of a veterinary officers' training camp in the medical officers' training camp where they will commingle with officers of other corps of the Medical Department, is, for the present at least, not undesirable. The contact is mutually beneficial, provided, however, that the veterinary curriculum include only relevant courses; i. e., be made as "water-tight" as possible.
 - d. As there is more work than one veterinary instructor can do properly, it is recommended that additional instructors be added as the curriculum becomes intensified and the work develops. Two are needed now.
 - e. The military instruction should be turned over eventually to the veterinary instructors.
 - f. The course in equitation should be made just as military ("drill mounted") as the foot drill. At present it is largely recreative only.
 - g. Veterinary officers should be graded not on military work alone. The following is suggestive in this regard: The officers—professional ability as determined by examination, adaptability to military service, general education, deportment, proficiency in military work, psychological test.

DAVID S. WHITE, *Major, V. C., N. A.*

This method of instruction was followed until June 20, 1918, when, after some correspondence and the receipt of the following letter, the instruction was completely changed:¹⁷⁸

JUNE 8, 1918.

From: The Surgeon General.

To: Commandant, Medical Officers' Training Camp, Camp Greenleaf, Fort Oglethorpe, Ga.

Subject: Veterinary officers in training.

1. It is desired not to request orders for assignment to station of the veterinary officers comprising the class due to graduate June 20 until recommendations have been received from the school regarding promotions and qualifications.

2. As concerns qualifications, it is requested that the men be listed as to their general suitability for the positions enumerated below. Where the main reason for suggesting an officer for a given line of work is his preference in the matter please so state.

3. The positions referred to are:

- (a) Camp veterinarians in divisional cantonments with possibility of becoming division veterinarians.
- (b) Veterinarians at auxiliary remount depots (senior).
- (c) Veterinarians in charge of mobile veterinary units for overseas, *a*, *b*, and *c*, require energetic and progressive men with executive ability and the demand is far ahead of the supply.

- (d) Veterinarians of smaller camps and of Cavalry and other detached organizations.
- (e) Assistants for veterinary hospital units and remount squadrons for overseas.
- (f) Assistant veterinarians.
- (g) Veterinarians for meat inspection service.
- (h) Veterinarians for transport duty.

Under *g* and *h* list only men who have had experience and please state what this experience is.

4. It is requested that this report be expedited for the reason that a new class of 290 is being ordered to report to you for instruction on June 20, 1918.

5. It is also desired that the new class be divided with the view to graduating the most promising half of them July 20, 1918.

C. F. MORSE,
Lieutenant Colonel, M. C.

The new course of instruction was carried out as indicated in schedules which were supplied. These schedules covered the period from July to December, 1918, and were divided into two sets: One for the basic course, the other for the professional course of instruction. Prior to July 20 the professional subjects were given with the basic course, professional lectures being substituted for lectures on the basic schedule, which were of no value to the veterinary officers. Lectures were given on the following subjects:¹⁷⁷ Inspection, purchase, and shipment of animals; disinfection; feeds (grain, roughage, grass); feeding; watering; water; poisonous plants; salting; glanders; influenza; lice, flies, etc.; mange; shoeing; stable management, hygiene; veterinary administrative matters.

On June 20 a class of 200 student officers reported and 100 of the most promising were selected and given an intensive course of instruction.¹⁷⁷ The selected group was designated the "short-term class" and received but one month's instruction. The basic course was given at regularly scheduled hours and the professional course when hours became available during the day, each evening, and Saturday afternoons. The remaining student officers formed a group which was designated as the "long-term class," and received the basic course of instruction during the first month and the professional course during the second month. A new class reported July 20 and the designation of the "long-term class" was changed to the "senior class," the new class being designated the "junior class." From this time on two classes were in attendance, a junior class reporting each month and a senior class graduating or completing the course.

Until the middle of June not one veterinary officer was detailed as instructor, and with the great increase in the number of students and the formation of two classes, the detail of more instructors became imperative. The course of instruction was improved and the scope of the work increased. On September 1 the veterinary officers were formed into a separate battalion and veterinary officers were detailed to serve in the following capacities:¹⁷⁷ 1 battalion commander, 1 battalion adjutant, 4 company captains, 2 quiz masters. The company captains selected the company lieutenants, sergeants, etc. These assignments were for one week only, thus permitting a maximum number of officers to function in these various capacities.

In addition to the regular schedule, the classes received practical instruction in glanders testing (ophthalmic), disposal of carcasses (cremation), and other practical instruction, as time and opportunity permitted.¹⁷⁷ On Saturday

morning the quiz master gave a written examination on the basic subjects covered during the week. The seniors were examined on the professional subjects covered during the week. The grades were entered in the card files, a card being made out for each student at time of arrival. Two sets were kept, one for the basic course, the other for the professional course data, including the qualifications and nature of previous professional work. From these cards were obtained the data for necessary reports.

Student officers having special experience in military or professional matters were called upon to lecture on the subject. The junior students were given a preliminary examination (written) on professional subjects at the completion of the basic course, or as early in the senior month as possible. Men unfit, professionally or otherwise, were recommended for appearance before an efficiency board.¹⁷⁷

SCHOOL OF GAS DEFENSE

The School of Gas Defense was opened November 23, 1917, the gas house being situated at the northern extremity of the camp near the septic tank.¹⁷⁹ During the winter, when possible, instruction was given in the open at the gas field, but when the weather interfered it was given to the enlisted men in the mess halls of the various groups, and to the officers in the "Y" at Camp Greenleaf and later in the Warden McLean auditorium. In the latter part of May, 1918, it was decided to move the gas field to a new location in section B, near the Snodgrass Hill road. (See Chart I.) The gas house was taken down and reerected in the new location, and a convenient administration building, including a lecture hall with a capacity of 200, mask room with racks, and offices, was provided. The new gas field was opened for instruction on June 15, and, with the exception of certain lectures given to the medical officers' training camp classes in the Warden McLean auditorium, all training was given there. Later, benches for the accommodation of 600 men were provided. Instruction was suspended December 7, 1918.¹⁷⁹

During the life of the school, instruction was given to 41,361 enlisted men of the Medical Department and 8,781 officers of the Medical Corps.¹⁷⁹ In addition, instruction was given to approximately 1,300 men and 60 officers of the 11th Cavalry, in August, 1918. In compliance with orders from the Chief of Engineers, on September 16, a full course was given to a class of 1 officer and 32 noncommissioned officers from Camp Forrest, to fit them for instructors in a school to be established in that camp.¹⁷⁹ After that school had been formed, at the conclusion of the training given to the several classes, the men were brought to the gas field at Camp Greenleaf for demonstrations and gas-house experience. The officers and men of the 605th, 210th, 211th, 212th, and 213th Engineer Regiments were in this way passed through gas.

*Equipment.*¹⁷⁹—When the school was opened it was provided with the full equipment for a divisional school as in use at that time, including 496 masks. In a short time equipment used at the Medical Officers' Training Camp at Fort Benjamin Harrison was made available, increasing the number of masks by 504. Additional masks were received from time to time until, when instruction was closed, the supply totaled approximately 6,200.

*Sterilization of masks.*¹⁷⁹—The masks were all sterilized by the gas squad, following the standard method, by compound cresol solution. After each batch had been treated, sample masks were submitted to the laboratory at General Hospital No. 14 for bacteriological examination, with uniformly good reports.

*The gas squad.*¹⁷⁹—On December 2, 1917, three enlisted men were assigned to care for the property then housed in tents at the gas field. The squad later was increased from time to time until it numbered 17. These men cared for the masks, disinfected them, kept them in repair, policed the field, assisted in the demonstrations, etc. Certain of the sergeants and corporals who showed proper capacity acted as drillmasters to the enlisted classes, and without exception the men detailed to this squad showed themselves capable and faithful.

*Meteorological station.*¹⁷⁹—Early in 1918, application was made for the establishment of a field weather observation station at Camp Greenleaf, in connection with the gas school, and when the new gas buildings were constructed, provision was made for this station in the erection of a steel tower for wind instruments. Finally the Signal Service established the Greenleaf station, sending three noncommissioned officers, with the necessary equipment. In addition to the ordinary weather observations, aerological high-level wind observations were taken twice daily by means of hydrogen balloons.

INSTRUCTION

Instruction, as finally evolved, naturally divided itself into two courses, one given to enlisted men and one to officers.¹⁸⁰

Enlisted men.—The course lasted one week and was planned to include 12 hours, 5 hours being devoted to instruction and drill at the gas school, 5 to drill under the mask at their own camps and under their own officers, and 2 to a demonstration at the gas house of gas clouds, tear bombs, and the protective qualities of the mask against lung irritants and tear gases in the gas chamber. The instruction was for the purpose of giving them an understanding of the whole subject and drill in the adjustment of the mask, and included an outline of the gas offense, describing the objects sought for in the use of gas, the physical standards of gas and the atmospheric conditions necessary for a successful gas attack, the types of gases used as to their effects on the individual, and the various ways in which gas was used in actual war. Then the system of protection, including the principles and construction of the mask, as well as the adjustment drill, the action of the vesicants (mustard oil) and means of protection, the construction of gas-proof dugouts and shelters, and the protection of stores, the signs of different kinds of gas attacks and customs of giving and transmitting warnings, as well as the regulations in force at the gas alarm, the methods of clearing trench and adjacent areas of gas after an attack, of repairing damages to property and equipment, and also an outline of first-aid treatment was explained to them. The second part of the instruction, carried on in their own organizations was for the purpose of accustoming the men to work under the mask.

Officers' course.—This course followed the same general lines as that given to the enlisted men, but was naturally much more elaborate. The responsibility of the officer for his men was impressed on them, and the theories and principles involved in both offense and defense were fully explained. In addition the gases used were described in detail and their pathologic effects noted. The principles of treatment were given in as full a manner as the time would allow.

COURSE FOR LINE OF COMMUNICATIONS SERVICE

A special course for line of communications service was given under a letter of instructions from the Surgeon General, November 28, 1917, for text of which see page 78.

SPECIAL INSTRUCTION FOR ENLISTED MEN

Second in importance only to the training of officers was the training of enlisted men of the Medical Department. To this end several miscellaneous schools were conducted at the camp.

SCHOOL FOR ADJUTANTS, REGISTRARS, AND MESS OFFICERS

This school was established pursuant to the following order:¹⁵¹

General Orders, No. 65.

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., June 27, 1918.

1. A school for the training of selected noncommissioned officers as candidates for commission in the Sanitary Corps as adjutants, registrars, and mess officers is hereby established.

2. This school will function directly under these headquarters. The senior instructor, Camp Greenleaf, will provide the necessary instructors and outline and direct the course.

3. The buildings of the former brigade headquarters, South Dyer Hill, with such tentage as may be necessary, are set aside as accommodations for this school.

Personnel pertaining to this school will be quartered and subsisted therein.

Cooks and necessary attendants will not be members of the class under instruction.

4. Each entering class of candidates will not exceed 75, and at the end of two weeks it will be so reduced by vote of the staff of instructors as not to exceed 50. Candidates discharged from one class may be authorized to join another, but not a third.

5. Class of candidates will be limited approximately as follows: For adjutants, 20; for registrars, 8; for mess officers, 20.

6. Candidates will be relieved from duty with any organization to which they may have previously been attached.

7. Training will be both didactic and practical. The didactic instruction will be carried out in the school camp on Dyer Hill.

The practical instruction will be carried out in the officers' kitchens, messes, and School for Cooks of Camp Greenleaf and General Hospital No. 14.

8. As much of the didactic training which would be properly common to the several groups composing this school will be given to these groups together.

The time required for this didactic training will be one month.

9. Candidates under practical training will be quartered and subsisted with the organizations with which they are being trained. For administrative and disciplinary purposes, they will be under the command of commanding officers of such organizations.

The period of practical training will not be less than one month.

10. Course in practical instruction will be so arranged as to include a period covering the latter part of one month and beginning of another, when most of the clerical work is done.

11. Practical instruction as adjutants will be given five groups of four candidates each at the following headquarters offices: Camp Greenleaf, General Hospital No. 14, motor group, animal-drawn group, hospital group.

Practical instruction for registrars will be given the entire group in that subject in the registrar's office of General Hospital No. 14.

Practical instruction for mess officers will be given in the messes of General Hospital No. 14 and the School for Cooks and various public messes of Camp Greenleaf.

12. Candidates under instruction in this school, whether receiving didactic instruction at the Dyer Hill Camp or practical instruction in offices, messes, etc., will not be required to perform any duties not directly pertaining to their special training, other than a reasonable amount of drill and setting-up exercises.

13. Organization commanders will submit to this office, between the 1st and 15th of each month, the names of noncommissioned officers who in their opinion are sufficiently qualified to be acceptable candidates for this course of training.

Designation of those to take this course will be made by this office from among the candidates so recommended.

By order of Colonel Munson:

E. S. SLEDGE, *Major, M. R. C., Adjutant.*

As shown in the above order, the school was first quartered on South Dyer Hill as a separate entity.¹⁸¹ (See Plate I.) In October it was moved to the noncommissioned officers' group and made a part of that command.⁶⁶

A six weeks' course was conducted, followed by from four to six weeks of practical training. After the school became a part of the noncommissioned officers' group, most of the practical training was given in the group by using the students as cadet officers for the companies of prospective noncommissioned officers.⁶⁶

The school started late and therefore the number of graduates was small. The classes graduating about the time of the armistice were given certificates of proficiency instead of commissions.⁶

NONCOMMISSIONED OFFICERS' SCHOOL

The most promising enlisted men were sent to this school for a course intended to fit them for the important work which the noncommissioned officer performs in the Medical Department.⁶ This work was of prime importance, as the call for men so qualified was at all times greater than the supply, and the school was pushed to the utmost throughout. The various headquarters and company officers were utilized for qualifying men for these positions, and men were carefully picked for such duty with that end in view. In the organization of different sanitary units a request was made upon this school by the group concerned, and the number of noncommissioned officers required for such a unit was sent.

The curriculum for the Noncommissioned Officers' School was arranged to cover, as completely as possible, the military duties of noncommissioned officers of the Medical Department, requirements of paper work necessary in all sanitary detachments, and the handling of men; the object being to have on hand and to be able to supply on demand well-trained personnel ready for promotion to corporals and sergeants.¹⁸² It was worked out so that any number of officers might be sent to the school and trained for the specific duties of various units, the training being in part separate and in part conjointly with the men who were to become their enlisted personnel.

The regular curriculum of the school consisted of 24 hours per week of didactic lectures on paper work, selected portions of Army Regulations and of the Manual for the Medical Department, and the solution of practical problems; 7 hours per week on Mason's Handbook of Sanitation and several hours each day of instruction in the school of the soldier, platoon and detachment, litter and shelter tent drill.

SCHOOL FOR COOKS AND BAKERS

This school played an important part in the development of men qualified for positions as cooks and bakers, for which the demand was very great. Men whose trade was cooking or work allied to this, or men who desired to learn the trade, were selected for this course, and an extremely practical scheme of instruction was used wherein the men were given elementary instruction in cooking and were then required to cook in the kitchens of the camp under the direct supervision of the officers of the school. After the school was well organized no sanitary organization left this camp without its full quota of cooks, and a great many men graduating from the school were sent on requisitions elsewhere.⁶

In the early days of the camp, schools for cooks were conducted in practically every section, but they were naturally on a very small scale. Their combined output did not exceed 60 per month.⁹² One special school was conducted in Battalion 15 under the same direction as the school for noncommissioned officers.¹⁸²

Owing to the limited time allotted this course—8 weeks—the instruction was necessarily intensive and the men devoted 12 hours daily to this work, inclusive of 1 to 2 hours of lectures. At all times the men were under the constant supervision of old and competent mess sergeants and cooks. At the outset they were thoroughly drilled in matters pertaining to cooks, police, cleanliness, and sanitation. Gradually, as efficiency manifested itself, they were allowed to assume some of the duties of cooking, until, as the term drew to an end, the embryo cooks were doing all the cooking and the old cooks exercising only an advisory capacity.

By experience it was found that the best results were obtained by the volunteer system. That is, after being in camp a period the recruit had become accustomed to camp life, had gotten considerable drill, had become orientated and in a position to specialize, as it were. Then the duties were made known to the command and volunteers called for, each applicant questioned privately and carefully as to his qualifications, and the duties again explained to him. By so doing a surprisingly large number of highly intelligent, industrious, and capable men could be selected who, by hard and painstaking work, could be made into efficient mess sergeants and cooks. This school furnished numerous cooks to organizations organized in this and other groups of Camp Greenleaf for overseas duty.¹⁸³

The school gradually deteriorated on account of the great demands upon its personnel until it practically ceased to function.¹⁸⁴

In June, 1918, the seriousness of the situation was so manifest as to call for the issuance of the following order:¹⁸⁵

General Orders, No. 59.

HEADQUARTERS CAMP GREENLEAF,
Chickamauga Park, Ga., June 13, 1918.

1. A school for cooks and bakers is hereby established at this camp. It will function directly under these headquarters.

2. The main purpose of this school is to train men in plain Army cookery. Those showing special aptitude will be given a course in cooking for the sick and in the preparation of light diets.

3. The instructor staff of the School for Cooks and Bakers will include an officer in charge and such assistants, both commissioned and enlisted, as may be necessary.

4. Men will not be sent to this school until after they have received fundamental instruction in the duties of the soldier.

They may be taken from any organization in Camp Greenleaf, and during such instruction will be under control of the officer in charge of the School for Cooks and Bakers.

Men who have completed their training as cooks and bakers will be returned to their previous organizations unless ordered away to outside duty.

5. The enlisted men selected for instruction will, as far as possible, be chosen from those who have had some experience in cooking, or who have expressed desire to take up this line of work.

Men who are physically substandard, but not to an extent which would in any way interfere with their efficiency as cooks, may be selected.

6. All men selected for training as cooks and bakers will be given a thorough examination to determine their freedom from communicable disease.

7. Selected men who have qualified in the School for Cooks and Bakers, and who show apparent aptitude for the duties of mess sergeant, will be given a special course of training therefor.

8. The school will be organized on a basis of 300 men under instruction, and with a basic course extending over a period of six weeks. Persons being trained as hospital cooks or mess sergeants will be retained proportionately longer. As far as practicable, classes will be graduated in the proportion of one of 100 men every two weeks.

9. The course of instruction in the School for Cooks and Bakers will be a full-time course, other than such exercises as are necessary to keep the persons under instruction in good physical condition.

10. Six kitchens and mess halls, 12 barracks and 6 lavatory buildings pertaining thereto, located in the eastern end of the cantonments formerly occupied by the 51st Field Artillery, are hereby set aside as accommodations for the School for Cooks and Bakers.

11. Training will consist of a basic course, which will include the theory and practice of cookery, nutrition, and the handling and preparation of the ration. This basic course will be carried out in the buildings of the School for Cooks and Bakers.

It will be supplemented by practical training of persons under instruction in the various public messes of Camp Greenleaf, the regular cooks of these messes serving as instructors for this purpose.

12. The public messes in which practical training in cookery and mess management is being given will be given constant supervision by instructors of the School for Cooks and Bakers. They will report to the officer in charge of the school any mess which may appear to them to be faulty in any respect, with a view to its correction through these headquarters.

13. Pastry, cake, and other articles of food prepared by the School for Cooks and Bakers as part of its work of instruction may be sold to the post exchanges or messes, and the funds used for the purchase of materials and equipment necessary to such instruction.

14. Requisition will be made for such equipment for both post and field use as may be necessary for the instruction work.

By order of Colonel Munson:

E. S. SLEDGE, *Major, M. R. C., Adjutant.*

This newly constituted school was put under the direction of officers assigned to the Nutrition School.¹⁸⁶

In July, 1918, the school was again reorganized, and from that time on it was very successful, no sanitary organization leaving camp without its full quota of cooks, a great many men graduating from the school being sent on requisition elsewhere.¹⁸⁷

A section of the camp was assigned to this school; and besides the barracks occupied by instructors and students, several model kitchens were established and a large model bakery was built, where 20 student bakers could receive instruction at one time. This bakery was built with funds appropriated by the camp exchange, and its output was sold to organizations of the camp and at the several branches of the camp exchange.¹⁸⁷

Just before the armistice was signed this school consisted of 600 student cooks and bakers, and arrangements were being made for the graduation of 200 every two weeks.¹⁸⁸

The main purpose of the school was to train men in plain army cookery.¹⁸⁹ The instructor staff for the school consisted of an officer in command, an officer in charge, supply and mess officer, one officer in charge of classes and instructors, one officer in charge of students taking the practical work in kitchens, and such noncommissioned officers, who were especially adapted for the work, as were required.

The students were men transferred from the draft after they had received fundamental instruction in the duties of a soldier. They either had previous knowledge of cooking, were adapted to the work, or manifested a desire to be cooks. Also men from other organizations were detailed on detached service to the school. When the course was finished the latter returned to their respective organizations. Each student was given a thorough examination in order to exclude the possibility of any communicable disease.

The basic course consisted of six weeks' training. The first two weeks were given to the study of the Manual for Army Cooks, lectures on personal hygiene, and demonstrations in the school kitchens of one or two articles on that day's bill of fare.

For those who had shown special ability during the two weeks' theoretical training, a course was given covering a period of three weeks to fit them for mess sergeants. During this course the textbooks used were Manual for Army Cooks, Mess Sergeant's Handbook, and Mess Officer's Assistant. Such subjects as food spoilage, mess management, purchasing of food, food values, balanced bills of fare, sanitation, handling the Army ration, food substitutes, use and care of kitchen utensils were gone over thoroughly and an examination was given at the end of the course.

In the theoretical course the demonstrations were given by an experienced cook in the school kitchens. The dish demonstrated was cooked and used at the following meal. Questions were asked during and after the demonstration. At the end of the two weeks' theoretical course an examination was held and each student rated. Those showing adaptability were then started on their practical course in the kitchens. Those making a low rating or found inapt were transferred as not suitable for cooks.

The students for their four weeks practical course were assigned to duty in the kitchens, under the supervision of a qualified mess sergeant and good

cooks, as assistant cooks. Here they themselves were required to do the actual preparing and cooking for a company of men. While serving as assistant cooks they were visited daily by an officer, their work supervised, and they were questioned in regard to the kitchen, the food being cooked, and their progress noted.

When they were found not doing the work according to the Manual for Army Cooks, their attention was called to the fact. At the end of the four weeks' practical work the students were again examined. Those found to have made suitable progress were transferred to units in need of cooks. Those making a low rating were kept in kitchens a longer period, until such time as they demonstrated their ability to make second cooks, when they were transferred.

A pastry kitchen was operated for the training of students in the making of pastry such as is used in an army mess. This was supervised by an experienced baker. As nearly as possible all students at the end of their practical training course were given 10 days' practical work in the pastry kitchen before being transferred to other units.

In brief the whole course of instruction consisted of 2 weeks' theoretical study, 4 weeks' practical work, and 10 days' special pastry cooking.¹⁸⁹

By giving the two weeks of theoretical work in one continuous course it was thought the time with about 80 per cent of the men was entirely lost and wasted.

SCHOOL FOR MOTOR MECHANICS AND DRIVERS

In this school men, preferably experienced by reason of former employment along the lines of motor mechanics and driving, were instructed in the work of caring for and maintaining motor trucks and cars, and in addition those showing an aptitude for this work were given preliminary courses along these lines, as well as lessons in driving.¹⁹⁰ No instruction of novices was attempted, but the instruction was given to men who already knew how to drive cars but who required correction of faults and a more thorough knowledge of the machines they were to use. A certain amount of instruction was given motor drivers from the early days of the camp, but such instruction was not well organized or systematic. The school work was reorganized January 28, 1918, and a regular motor school for field sanitary units was established in the motor group.¹⁹¹ No instruction was given men unfamiliar with this work, but all men showing some knowledge of driving or repair of motor cars, who arrived at camp either from recruit depots or in the draft, were assigned to these units and were then sent to the school.

The school consisted of three departments:¹⁹¹ The truck-driving department, which instructed drivers in operating the type of truck assigned to an organization; the truck-repair department, which instructed company mechanics in replacing parts of trucks; the ambulance-repair department, which instructed ambulance company mechanics in replacing ambulance parts.

The truck-driving department.—This department was under the general supervision of the senior instructor, who taught the drivers of each organization to operate their own trucks.¹⁹¹ Each field hospital company and ambulance company having trucks assigned to it placed in charge of one of its trucks

a driver. This driver was definitely and permanently assigned to that truck. Each truck was numbered by the company transportation officer. Drivers thus assigned reported each drill day at 1 p. m. at the place of assembly of his trucks, for instruction in operating the truck so assigned, and devoted the time to care and operation of his truck. The drivers of each organization, during the period of the motor school, were under the charge of the company transportation officer and the immediate charge of the company truckmaster.

As new members were added to the school from the general camp, each truck driver was given a truck in his company, in this way building up in each company its quota of truck drivers permanently assigned to definite trucks.

The truck-driving instruction was under the general charge of a sergeant, first class; and the immediate charge of the truck drivers for each company was placed with the company truckmaster or transportation sergeant. The transportation officers of companies saw that the details reported promptly. They also endeavored to become acquainted with the transportation of their units and the qualifications of the men detailed for this work.

Ambulance-repair department.—This school was placed under the immediate charge of a corporal. The students were two men from each ambulance company and evacuation ambulance company selected by the company commander. One of the men so selected was the company mechanic. These men were known in the company as the two repair men, and were to be instructed so that they would be able to disassemble an ambulance, locate damage, and replace broken parts from the spare parts equipment of the company.

By arrangement with the Motor Transport Corps, one ambulance was available for the instruction of the class daily. An ambulance having broken parts was selected, and it was the problem of the class to locate the damage and replace the broken parts with serviceable ones. The broken parts were turned in to the motor property officer and new spare parts received, so that at the conclusion of the class the ambulance would have been rendered serviceable. The purpose of the class was to train every man so that he would be able to take out a broken part and put in the new one.

The truck-repair department.—This department was conducted, under the immediate charge of a corporal, in the same manner as was the ambulance-repair unit. Arrangements were made with the Motor Transport Corps and the motor property officer so that a truck needing replacement of broken parts might be used for class instruction. Broken parts were taken out and serviceable ones substituted from the supplies on hand, or from the trucks out of service. When no trucks were available for instruction in the foregoing manner, a truck was disassembled by the class and then put together.

The pupils in this class were one repair man from each ambulance company and two from each field hospital.¹⁹¹ Each ambulance and field hospital company detailed to the school a quota of students necessary to keep 40 trucks and 20 ambulances in daily operation for the necessary camp service, hauling wood, supplies, and food; also road building, sanitation, hospital, and incidental quartermaster work, including a quota of company mechanic students to work with qualified mechanics as understudies. This particular quota of drivers was composed of men who had been taught to handle a vehicle or who

had this ability from practice or vocation. With each student driver was placed an understudy or orderly who accompanied the vehicle on its daily road work to observe the manipulation, operation of mechanical parts, rules of road, methods of getting out of bad and rough places loaded and unloaded, etc. This duty the understudy performed for 14 days, during which period, at intervals of every few days, an instructor took him out to teach him actual manipulation, so that at the end of his understudy period he had proved his aptitude to be advanced to drive on light detail work, now being determined whether or not he was material for a field driver, and a report sent to his company commander. After completing this course of two weeks as understudy and followed by two more weeks of road driving, the student was returned to his company for the regular company work during the morning; in the afternoon small classes made up of drivers were detailed from the units to the motor school for advanced work on overhauling, adjustments, and replacement of parts, with individual staff mechanics and instructors who acted as foremen, and thus the work done on the unserviceable vehicles finally placed them in working order for the service of transportation. The aim was to let the student use only the ordinary equipment to keep his vehicle in condition, such as would be supplied in campaign service, and to thoroughly acquaint him with a method of attack for all possible troubles he might encounter in routine field work. The school was using and maintaining some 72 trucks, 40 ambulances, 3 automobiles, and 7 motor cycles, 80 per cent of which were old and worn, a large portion having seen service on the Mexican border. It maintained a spare parts supply department, which was well stocked with all the necessary equipment, tools, etc.

Special instruction was given in assembling motors for the students.¹⁹ Special demonstrations of the make-up of storage batteries, their care and operation; carburetors, their working parts, adjustments, and uses; methods of ignition, generators, and magnetos; wiring adjustments and systems; in short, the advanced classes dissected and replaced all parts of a motor vehicle, which had to pass the final inspection and test before credit was given for the work done. This work was augmented by lectures under the immediate charge of the school director and his assistants.

During the six weeks in operation, the school had in its entirety 175 students on the roll; 75 of this number were advanced students and the remainder were in the driving classes, with 50 per cent of these drivers ready to pass into the advanced class in the course of a few more days on the road work.¹⁹⁰

In the early summer of 1918 the War Department sent three specialists (Sanitary Corps officers) to operate this school. Through their efforts the work of instruction was coordinated and improved so that a very excellent motor school was conducted. During the entire life of the school all officers assigned to motor units received the same instruction as the enlisted men.¹⁹²

The difficulties of pursuing a systematic course of instruction for recruits received in this camp, in view of the numerous calls upon the personnel and the entire uncertainty as to the length of stay of any body of men, caused the adoption of two schedules of instruction, designated "A" and "B," for the first four weeks training.¹⁹³ Recruits received were put through two weeks' training

under Schedule A and then passed to Schedule B. If they remained longer than four weeks they passed on to special training, either in the regular organization to which assigned or in the motor department. The first two weeks of motor instruction was devoted to the classification of mechanics and drivers in order to determine the knowledge they actually possessed. The second two weeks was devoted to training men who were shown to be good mechanics or drivers in the special requirements for handling the motor transportation furnished the Medical Department. Subsequent time was devoted to raising men by instruction to a higher rating. During the first four weeks this instruction was carried on hand in hand with general instruction in the duties of a soldier.

From this school highly trained mechanics and specialists in every phase of motor equipment were graduated. Large classes of trained chauffeurs and motor-cycle drivers were also graduated.¹⁹²

The students who had completed the course of instruction and were awaiting assignment were utilized to handle the motor transportation of the camp, which was concentrated in the motor group.¹⁹⁰ This part was quite a large one, having, in the fall of 1918, 50 motor cycles, 12 touring cars, 60 ambulances, and 100 trucks.¹⁹²

The success of the school can well be judged by the condition of this transportation when inspected by an inspector of the Motor Transport Corps in October, 1918, who reported that this equipment was in better condition than at any other camp he had visited, and at the time of his inspection less than 4 per cent of the motors were in need of repair.¹⁹²

VETERINARY SCHOOL

Enlisted men of the Veterinary Corps at Camp Greenleaf were organized into Enlisted Company A on May 2, 1918.¹⁹¹ The company had a regular company organization and functioned primarily to train men for the duties of veterinary soldiers. At the same time it took over and operated the stables of the medical officers' training camp, with about 400 horses and mules and 210 sets of horse equipment to care for. Although this was an instruction company, it acted as a service company as regards the animals.

The personnel of the company comprised graduate veterinarians and non-graduates. The nongraduates numbered 422, and were of the following vocations: Horsemen, teamsters, farmers, agricultural students, veterinary students, horseshoers, saddlers, farriers, clerks, stenographers, cooks, pharmacists, miscellaneous. From this group were derived a number of noncommissioned officers of long service in the mounted branches who were of the utmost value in training and instructing recruits.

The course of instruction for enlisted men included the subjects of the school of the soldier, foot drill, discipline, honors and customs of the service, sanitary and Infantry drill, tent pitching, gas drill, first-aid and stable management, and other veterinary subjects. All men received daily three hours of instruction in equitation, including fitting and care of equipment and care of the horse.

The care of the animals and equipment afforded much practical instruction in animal management, hygiene and sanitation, and care of equipment.

Additional instruction was provided for the enlisted men who were graduate veterinarians and who were expected to take examinations for commissions. Special attention was given to Army paper work and the rendition of reports. Mimeograph copies of correspondence forms and the most common and important reports were furnished to each man, as were the common War Department manuals. Lectures were given at least twice a week on Army paper work, and the men were also encouraged and detailed to prepare papers dealing with veterinary subjects, which they read before the company.

Company A was disbanded about December 20, 1918, by the discharge of all enlisted men. This included all the graduates and practically all the nongraduates.

SCHOOL FOR FARRIERS

This was a part of Stable Company No 1, in the animal-drawn group, and was organized in February, 1918.³³ Twenty selected enlisted men took this course, in addition to men who performed this duty in each mounted organization.

On May 13, 1918, this school was discontinued, as a separate entity, all men to be trained as farriers being instructed after that date in the veterinary school and transferred to the veterinary department.³⁵

SCHOOL FOR BLACKSMITHS, HORSESHOERS, AND SADDLERS

This school was established in the animal-drawn group in February, 1918.³³ Men rated in the different organizations as blacksmiths, horseshoers, and saddlers were sent to this school for training. The time allotted to this instruction was variable, depending upon the ability of the men. If a student became proficient in a short time, he was sent back to his organization and his place was taken by another man. Plenty of material for instruction was available, as the students not only received didactic instruction, but were required to shoe all the horses and keep the wheel transportation and horse equipment in proper condition.^{33 35}

SCHOOL FOR DENTAL ASSISTANTS

Enlisted graduate or undergraduate dentists were instructed in this school in the work pertaining to their department, and at the end of a specified course men who were found thoroughly qualified in a professional way were recommended for examination for commission in the Dental Corps.⁶

The course consisted of one month's intensive training in the school of the soldier, including gas instruction. As those men were all dental graduates, it was not deemed necessary to give them any professional training. However, they were given a course in Army paper work, and each day eight different men from this company worked in the dental infirmary, which gave them a working idea of the Army equipment. They were also instructed in the unpacking, setting up, and packing of the field equipment.¹⁹⁵

SCHOOL OF PSYCHOLOGY

In this school enlisted men who had had previous experience in this branch, and those who desired to undertake the work, were taught the use of psychology in the Army and the system of morale work.⁶ The work of this school is described under the head of "School of Military Psychology" (p. 100).

ORTHOPEDIC SCHOOL

At the school for care of feet, one of the orthopedic sections for instruction which was afterwards merged into the School of Military Orthopedics, a number of selected noncommissioned officers were instructed in the fitting of shoes and the care of minor injuries of the foot.⁹²

The capacity for the instruction of numbers of enlisted men in the School of Orthopedics was gradually increased, and in April, 1918, 70 enlisted men from 18 organizations were instructed.¹⁹⁶ This instruction was suspended in May, 1918, on account of the many changes and readjustments in the camp during that month.¹⁹⁷ It was recommended in June, 1918, and efforts were made to give basic instructions in minor foot ailments, shoe fitting, and splint application to 4 per cent of the enlisted men of the different organizations.¹⁹⁸ In July this instruction was given to this percentage of men in the motor group, animal-drawn group, and evacuation base hospital group, numbering 440 men.⁴⁷ More intensive instruction of small groups of enlisted men in massage, brace making, minor foot ailments and shoe fitting was begun.¹⁹⁹ During August the instruction of the 4 per cent of the enlisted strength was continued, and 523 men received instruction. It was quite difficult to get the full attendance on account of the large number of outgoing organizations during the month.²⁰⁰ During September 892 enlisted men received orthopedic instruction.

A number of chiropodists were assigned to the camp and received special instruction in the Orthopedic School and were then assigned to different hospital units and to the development battalion.^{201 202}

In October special instruction in shop and plaster work was given to nine selected enlisted men of Base Hospital No. 157 (orthopedic). General instruction was given to 974 enlisted men during that month.²⁰³

The number of students began to diminish in November, only 510 enlisted men being instructed during that period.^{204 205 206}

This school was formally closed December 24, 1918.²⁰⁷

SCHOOL FOR X-RAY TECHNICIANS

The work of this school is described in the discussion of the School of Military Roentgenology (p. 137 et seq.).

MISCELLANEOUS INSTRUCTION

In addition to the instruction given in the schools briefly described above, special instruction was given to enlisted men in the duties pertaining to the following activities: Laboratory helpers;⁹² animal-drawn units;^{3 19} hospital trains⁹² and evacuation group;⁵⁹ convalescent depot and convalescent camp;¹⁸² mobile operating units;¹⁸² sanitary squads.¹⁸²

When it is remembered that the great majority of enlisted men in the Medical Department must be specialists in one or more lines, the importance of these schools and courses will be recognized, and one of the sources of greatest disappointment to the command was that it was frequently not possible to keep enlisted men at the camp long enough to impart the instruction and training intended.⁶

FORT RILEY, KANS.

(June 1, 1917, to June 30, 1918)

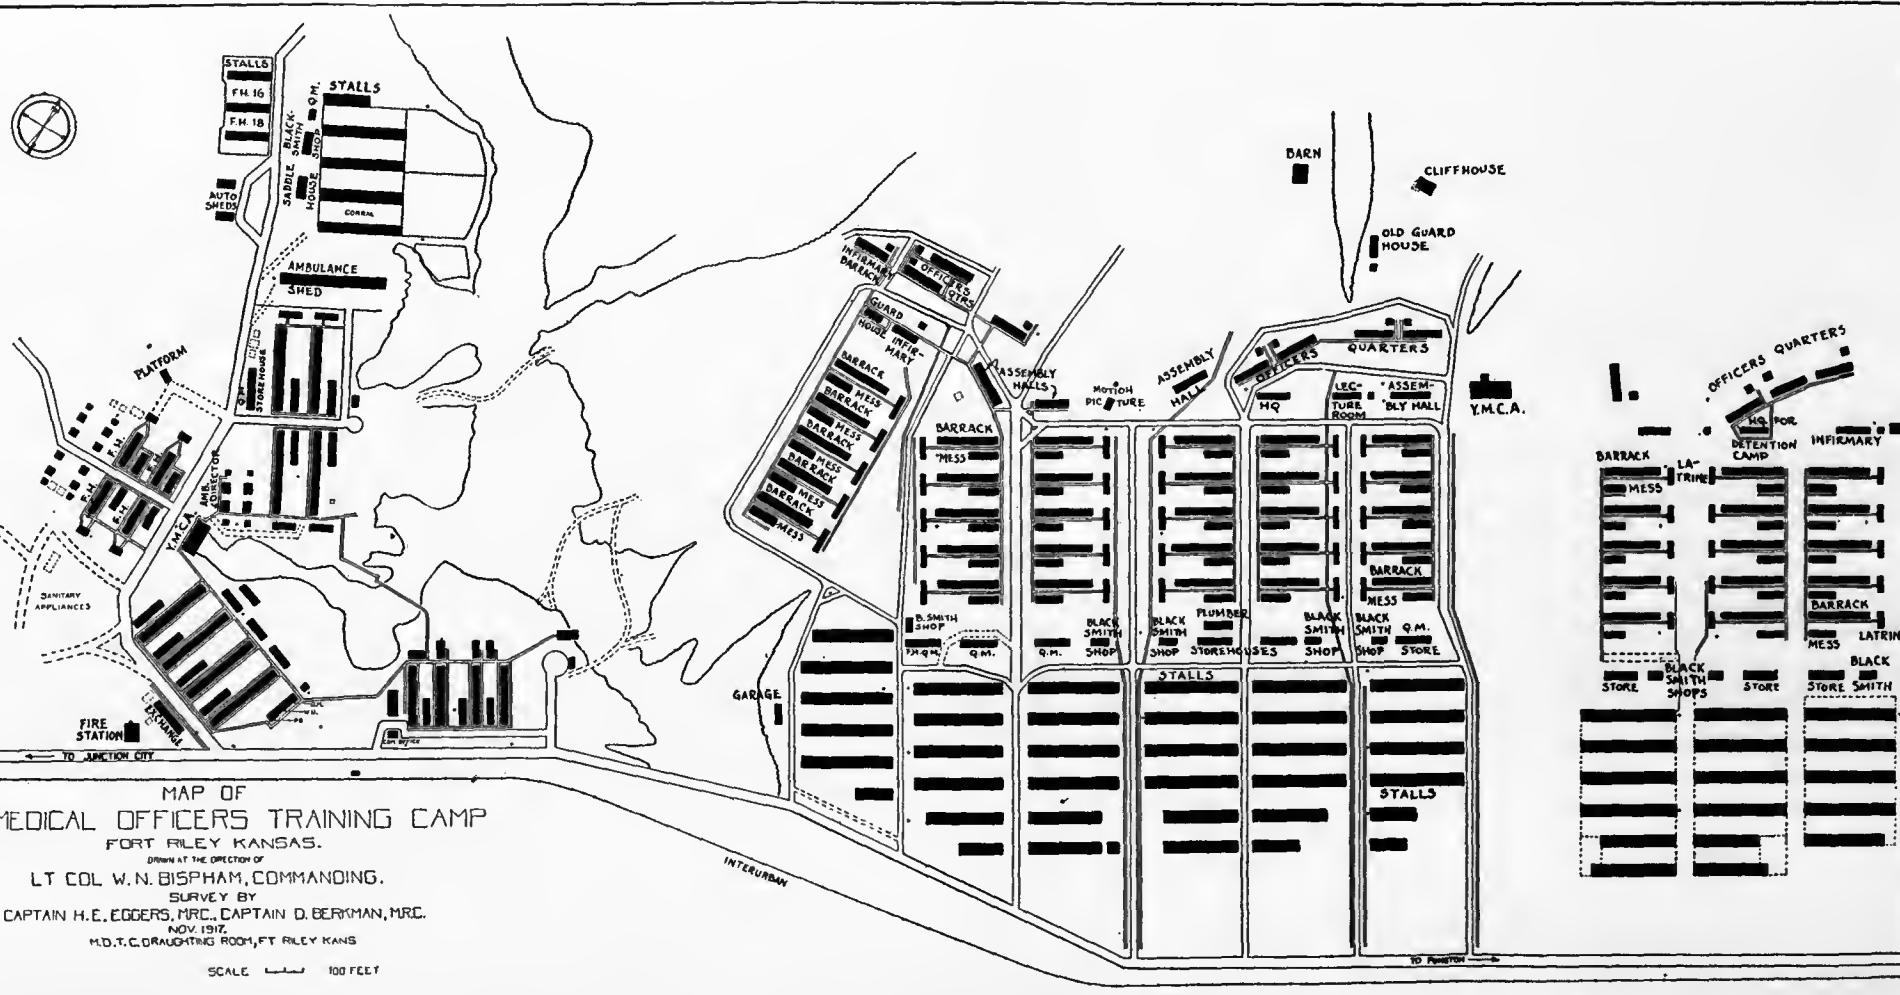

ORGANIZATION

This camp was organized in compliance with a letter from The Adjutant General of the Army to the commanding general, Central Department, dated May 11, 1917, and to the quartermaster general, of the same date.¹ It began to function June 1, 1917.²⁰⁸ On the date of the opening the personnel of the camp consisted of the commandant, nine Regular medical officers, and two enlisted men. The site for housing the camp consisted of a tract of land north-east of the post hospital and north of the main road leading through the reservation. This area extended a short distance up what is known as Magazine Canyon. The terrain rises gradually from the road up to an eminence known as Wireless Hill, upon which was situated the wireless tower. To the east is a ravine through which runs One Mile Creek. Running northeast from the main ravine is a smaller ravine which divides the area described into two parts. That to the south was the section occupied by the medical officers' barracks; that to the north and west was the location of the barracks of the ambulance companies and field hospital companies, with the sheds and stables for their transportation.

This site had been selected a few days prior to the date set for the opening of the camp, and a contract had been let for four barracks, with mess halls and toilets for medical officers, and two barracks, with attached mess halls and toilets for an ambulance company and field hospital company.²⁰⁸ When construction actually began, allotment was also made for barracks, etc., for three more ambulance companies and three more field hospital companies. This last allotment also included stables and sheds for the necessary animals and vehicles, which were completed July 1, 1917.²⁰⁸

Headquarters of the camp was first established in the old Cavalry headquarters at Fort Riley.²⁰⁸ As no barracks were as yet completed, the Artillery guardhouse and the first floor of the Artillery band quarters were also temporarily assigned to the camp for quarters and mess, respectively, for the first student officers reporting. Notice was received from the Surgeon General of the prospective arrival of student officers on June 1, and as accommodations had not been completed, an effort was made to have orders amended so as to have students arrive in time for instruction to begin on June 15. This effort, however, was not successful, and the student officers began to arrive on May 28. On June 1, Student Company No. 1, composed of 34 student officers, was organized.²⁰⁸

The original organization of the student companies provided for the detail of one of the Regular officers on duty at the camp as company commander, but when the number of the companies began to materially increase, company

commanders and other officers were selected from the members of the several companies. Each company averaged approximately 100 students, and was quartered in its own barracks, with mess hall adjacent.²⁰⁹ The companies were combined into battalions and each battalion was commanded by a Regular officer.

The medical officers' training camp was under the commanding officer of Fort Riley for purposes of administration and supply, only the training being in charge of the commandant of the camp, who was responsible directly to the Surgeon General for its accomplishment.²¹⁰

On June 4 regular instruction began, and classes were held in the Artillery guardhouse. Student Company No. 1, on that date, contained 74 student officers.²⁰⁸ On June 7 the camp headquarters was moved to the new cantonment then nearing completion, and on the next day the student officers were moved into the first barrack building to be completed.²⁰⁵ On June 9, 15 noncommissioned officers and 523 enlisted men reported for duty.

On June 12, as enlisted men were arriving in appreciable numbers, a casual detachment was organized to handle all the enlisted men on their arrival.²⁰⁵ In this detachment provisional companies lettered from A onward were formed and placed under command of trained medical officers, and these companies in turn were divided into sections which were placed under the charge of especially selected enlisted men who had been made lance corporals. The lance corporals were promoted or demoted accordingly as they succeeded or failed. Those who made good had the advantage of starting their education in discipline and control of men at the very outset of their military life. From this casual detachment the recruits were assigned to whatever regular units were to be formed, such as field hospitals, ambulance companies, and evacuation hospitals.

It was realized that a camp exchange was of very great value, not only in providing articles needed by the personnel of the camp, but also to retain the profits of such sales in the camp to be distributed among the units to be formed. An officer was detailed as exchange officer, and when the camp was ready for occupancy an exchange was established in the headquarters building. It opened for business on June 19, 1917.²¹¹ The business of the exchange increased enormously and finally a large building to house it was constructed from the funds of the exchange. In addition to the usual articles kept for sale in such stores, clothing and equipment for officers were handled, thus decreasing materially the necessary expenditures for these items made by officers entering the service. Each unit formed in the camp became a stockholder in the exchange, and on its departure from camp a settlement was always made. Frequently from this source alone a company would leave camp with a company fund of over \$1,000.

A number of officers and enlisted men of the National Guard were ordered to the camp for instruction, and they began to arrive June 20.²⁰⁸ The officers were combined into a company separate from the Reserve officers, and the enlisted men formed a detachment, which was placed under the command of one of the National Guard officers.

The first ambulance company (No. 18) and field hospital company (No. 18) to be formed completed their organization on June 24. A few days thereafter,

Ambulance Company No. 17 and Field Hospital Company No. 17 were organized.²⁰³ Officers for all of these units and for most of those subsequently formed were detailed for this duty from the student companies. If for any reason an officer did not perform satisfactory service on this duty, he was relieved and another detailed in his place.

At the end of June, 1917, 179 student officers had reported for instruction, and 60 noncommissioned officers and 1,626 enlisted men had reported for duty and instruction.²⁰⁸ The teaching staff of Regular medical officers at this time was 12, including the commandant.

On July 8 Ambulance Company No. 20 and Field Hospital Company No. 20 were organized, followed by the organization, on July 12, of Ambulance Company No. 19 and Field Hospital Company No. 19.²⁰⁸ During the month of July a special athletic department for the camp was started.²⁰⁸ An officer who had had a great deal of experience along this line was detailed as director. This department not only arranged athletic events and entertainments, but also superintended the physical instruction of the officers and enlisted men. An open-air theater accommodating from 2,000 to 3,000 men was designed and built. In this theater nightly entertainments of some sort were provided. An athletic field was laid out, and the outdoor physical instruction was so arranged that every man of the command got proper physical instruction daily. During this month 58 additional officers and 365 recruits reported for instruction.

In preparation for the early transfer of regimental detachments to the divisions to be formed, these detachments were organized in the provisional companies of the casual detachment and received very thorough instruction in regimental work.²⁰⁸

A Young Men's Christian Association building for the camp was opened formally on August 4. This building was in the center of the camp and its many aids for the welfare of the men were taken advantage of by a large majority of the camp personnel.²⁰⁸

On August 11 a Regular medical officer arrived in camp and gave approximately one week's course of lectures on military surgery, and the first review held by the camp was given him on August 16.²⁰⁸ On August 12, 12 assistant instructors were selected from the student officers who had been under training in the camp.²⁰⁸ On August 13 and 15 Provisional Ambulance Company No. 1 and Provisional Field Hospital Company No. 1 were organized.²⁰⁸ All of the companies for which authorization had been received had been formed, and these new units were organized to form a training unit for future companies, which might be ordered. These companies were kept filled to their capacity, and as soon as a new unit was started the major portion of the personnel was assigned from one of the provisional companies, and the provisional company in turn was filled by recruits from the casual detachment. On August 14 the first enlisted men were selected for service overseas.²⁰⁸ The detachment of officers and enlisted men to form the nucleus of the regimental services and sanitary trains of the 91st Division (Camp Lewis), 87th Division (Camp Pike), 88th Division (Camp Dodge), 90th Division (Camp Travis), and 89th Division (Camp Funston) left camp August 25.²⁰⁸ The number of officers sent to each

camp was 40. The last part of August saw the gradual withdrawal of a number of Regular officers from the camp to duty elsewhere and the detail in their places of reserve officers from the student companies which had just completed their three months' course of instruction. From that time on, all new instructors and assistant instructors were taken from the reserve officers on duty in the camp.

During the month of August, the first three companies of student officers completed their course of instruction as far as it was possible for them to go, and seven new companies were formed having at the end of the month, 1,028 officers under instruction. During the month 1,006 additional officers and 470 recruits reported to the camp for instruction.

A press bureau was established at the camp in August in order that helpful and proper advertising might be given this training.²⁰⁸

A complete system of trenches built according to the plans of those used on the Western Front, was started at this time, and their construction was continued by the labor of enlisted men who were afterwards to be detailed to regimental detachments. This method of construction was used so that there would be at least a few men in each detachment who were familiar with trench construction.²⁰⁸

On September 8 the officers and men of the National Guard who had been under instruction at the camp for two months were ordered back to their commands.²⁰⁸ During September 102 officers and 1,392 recruits reported to the camp for instruction, and Companies No. 11, No. 12, and No. 13 were organized.

Quite a number of dental officers had recently arrived in camp, and as they were all new men a course in Medical Department paper work was started and these officers were given instruction in all papers which concerned the Dental Corps.²⁰⁸

The first evacuation hospital which was formed in this country during the war, Evacuation Hospital No. 1, was organized October 10.²⁰⁸ The entire personnel, both officers and men, were selected from those on duty at the camp and the unit received very careful training along military lines. During October only 14 officers and no enlisted men reported for instruction. On the other hand 332 officers were ordered to other stations for duty.²⁰⁸

In spite of repeated requests no allotment was made to prepare the barracks and other buildings for winter occupancy.²¹² The buildings as originally constructed were built with a single sheathing of partially cured lumber and the walls of the barracks had shrunk to such an extent that many cracks were visible, and it was realized that during the winter they would be uninhabitable. As the camp was left to its own resources, different expedients were made use of to make the buildings comfortable. Permission was obtained to haul from Camp Funston scrap lumber left from the construction of that cantonment. Altogether 100 truck loads of this material were obtained. All the carpenters found among the enlisted men were organized into a separate detachment and put to work lining the inside of the buildings with this lumber. The walls were first covered with newspaper and some tar paper purchased locally from

company funds, and then wainscoted to the height of the windows. By this method the wind was kept out and the barracks were made very comfortable and tight for winter without the expenditure of Government funds. By the end of November a large number of the barracks had been completed in this fashion.

In November the first hospital trains were organized.²¹² As their training was of a rather special character, a building was remodeled in such a way as to simulate the interior of a hospital car. A number of these units were formed in this camp and sent overseas.

Most of the work of training heretofore had been confined to sanitary trains and regimental sanitary detachments, but during this month orders were received to organize a number of evacuation hospitals. In these units all of the enlisted personnel was furnished by the camp, but the officers were detailed to them by the War Department.²¹²

During the month of November, 16 officers and 85 recruits reported to the camp for instruction.²¹² Seventy-nine officers were ordered to other stations for duty, including eight officers ordered to Deming, N. Mex., for duty, five to the 34th Division and nine officers ordered to Washington University, St. Louis, for a course of instruction in head surgery. Four hundred and eighty-six enlisted men were ordered to duty at other stations.

The gas house, which provided for gas instruction, was completed on November 16.²¹² Evacuation Hospital No. 7 was organized during this month, but no additional training companies were formed.²¹²

During the life of the camp (June 1, 1917, to February 4, 1919) the following units were organized:²¹³ Evacuation Hospitals 1, 7, 9, 10, 11, 12, 15, 16, 17, 19, 20, 21; Base Hospitals 70, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90.

The cantonment previously occupied by the 13th and 20th Cavalry Regiments and the gun sheds and artillery stables in the post of Fort Riley were turned over to the camp during the month of December. These additional buildings were to be used to accommodate the expected expansion of the camp.²¹⁴ An allotment of \$80,000 was made to remodel and to fit the gun sheds and artillery stables for barracks and the temporary buildings in the cantonment for winter occupancy.²¹⁴ When the material purchased for this work was received, a construction company of 100 men was formed from the enlisted men in the camp. This company furnished all the labor, both skilled and otherwise, and the work was brought to a rapid and successful conclusion.²¹⁴ The remodeling of the permanent buildings consisted of building large stairways to the second floors of the gun sheds, of flooring the stalls in the stables, of installing baths and toilets, and of arranging one gun shed as a mess hall and kitchen.²¹⁴

During the month of December, 387 Medical Department officers and 885 enlisted men reported to the camp for instruction.²¹⁴ Twenty-one officers and 79 enlisted men were ordered to other stations for duty. The department of current literature and Student Companies Nos. 15, 16, and 17, were organized during the month. Orders were received for the establishment, in connection with the basic course, of the schools of military Roentgenology and military orthopedics. The unassigned officers in the camp who had not been recommended for any particular line of duty were placed under observation and

carefully examined with a view of eliminating the unfit and assigning the qualified to duties for which they were best fitted.²¹⁴

During January, 1918, 274 officers reported to the camp for instruction. No enlisted men were received during this month. Orders were received during this month for sending large numbers of enlisted men to various base hospitals and other stations for duty in the United States and for overseas service. It therefore became difficult to fill the many requisitions received, and the training of both enlisted men and officers was somewhat hampered through this shortage.²¹⁵

The weather during the month of February being very mild a good deal of work was done in the sanitary laboratory, and all of the different types of incinerators were tried out under strictly scientific conditions.²¹⁶ It was determined by experiments that the amount of wood necessary as fuel in wood incinerators was excessive. As a result of these experiments a new incinerator was invented and used successfully throughout the remainder of the life of the camp. One hundred and seven officers reported for instruction during this month, but no enlisted men arrived. One hundred and fifteen officers were ordered to other stations for duty, eight were discharged from the service and ordered to their homes. Four hundred and sixty-four enlisted men were ordered to other stations for duty. Weather conditions made possible the more satisfactory drilling of companies and physical instruction of the command. The work in the map-drawing department was also made more satisfactory during this month. The personnel of field hospitals was cut down to such an extent in order to furnish details for base hospitals throughout the country that lectures and recitations only could be given these organizations.

On March 2 the first men to be received from the draft reported to the camp for induction into the service.²¹⁷ Prior to this all increments of enlisted men were either from recruit depots or transfers from other camps. Two hundred and sixty-three had reported to the camp on this date for voluntary enlistment.²¹⁷ About 4,000 men were received during the following week, but the rejections totaled 8 per cent of the whole.²¹⁷

During the month of March, 14th, 15th, 16th, 17th, and 18th Companies completed their courses.²¹⁷ Unfortunately, on account of the exigencies of the service, the number of men remaining to the end in the basic courses of these companies was a comparatively small percentage of those who started. Two hundred and one student officers reported to the camp for instruction and 377 were ordered to duty elsewhere, 22 officers were honorably discharged from the service during this month and 2 officers resigned.

A large replacement detachment, consisting of 52 medical officers and 700 enlisted men for overseas service, was sent out April 1.²¹⁸ Four hundred and twenty student officers reported for instruction during the month and 130 were ordered to duty at other stations. Officers and enlisted men had previously been sent to camps and stations all over the country, but apart from a few individual officers and a small number of enlisted men none of the personnel had heretofore gone directly overseas. Later, continuous drafts for overseas service were made on this camp.

The second increment from the draft received at the camp began to arrive May 24.²¹⁹ It consisted of 3,000 men. In May the thirty-third, and last, student company to be formed in the first camp was organized. One hundred and five officers and 604 enlisted men were ordered to other stations for duty, and on June 1 a replacement draft for overseas service, consisting of 200 officers and 1,040 enlisted men was ordered out.

The third increment began to arrive June 25 and this also consisted of 3,000 men.²²⁰ *

The meeting of the American Medical Association in Chicago in June was attended by a large number of officers from the camp, and an exhibit of models of field sanitary appliances made in the sanitary laboratory received the gold medal. At the special request of the association, the band from the camp was sent to Chicago and gave concerts the week in which the sessions were held. This band was the first 50-piece band to be organized in the Army, and as it was not officially authorized, the instruments had to be bought from private funds. These funds were provided by the publication of a camp yearbook.²¹¹

The general training of officers began to diminish from the 1st of June as the officers in training were gradually ordered away and very few officers reported at the camp for instruction.²²⁰ This was due to the decision to stop all general training at the camp after July 1.²²⁰ After that date the camp was used as a replacement and training camp for regimental detachments and sanitary trains.

As plans for training Medical Department personnel progressed, it appeared advisable, early in 1918, to consolidate the efforts of the Medical Department along these lines by combining the Medical Officers' Training Camp at Fort Riley with that in operation at Fort Oglethorpe, Ga., and by the expansion of the training camp at Fort Oglethorpe to conduct instruction of all Medical Department personnel there. An endeavor was made to secure the authority of the War Department for this movement, but The Adjutant General of the Army disapproved of such action, and ordered a continuance of the training camp at Fort Riley.²²¹ It was apparently considered that the maintenance of a training camp for the Medical Department was required in the central west to curtail the amount of travel of personnel called into service from a territory nearer that area. The Surgeon General, however, was able to secure authority for the transfer of a large number of medical officers, both Regular and reserve, and 300 enlisted men from Fort Riley to Camp Greenleaf, and thus a partial merger was effected. These officers and men left for Camp Greenleaf early in July, and what might be called the first Medical Officers' Training Camp at Fort Riley closed July 1, 1918.²²⁰

From June 1, 1917, to June 1, 1918, 2,094 officers and 9,228 enlisted men arrived at this camp for training, after which they were assigned to other stations.²²² On May 31, 1918, there remained in camp, under training, 986 officers and 6,809 enlisted men. During June approximately 450 medical officers were ordered out to various stations in the United States and to service overseas, in addition to those composing the organized units.²²⁰

GENERAL INSTRUCTION FOR OFFICERS

Instruction was followed according to the outline prepared in the office of the Surgeon General and later published as Special Regulations 49a, 1917. Schedules were made covering the hours specified, and instruction was begun on June 4, 1917.²²³ The method pursued was to detail instructors to certain specific subjects and to place all instruction in these subjects under their charge. At first only Regular officers were detailed as instructors, but as the camp increased in size and the reserve officers became more conversant with the work, some of the best qualified among these were detailed to the instruction force. Each training company, consisting approximately of 100 officers, had a separate schedule. It was necessary for each company to have a separate schedule because officers reported for duty irregularly, a few at a time, and the number 100 was taken as a basis for the formation of companies, as each barrack held approximately that number. These schedules were identical in subjects and number of hours for each subject, but naturally varied as to the time of any specified instruction. They were carefully made out, so that the time for the instruction of the several companies in any one subject did not conflict. This method had the redeeming feature, that the classes to be handled by one instructor were of convenient size, and permitted a more personal contact with the student officer. In giving this instruction, lectures were eliminated as much as possible and were only used to outline some important military or professional principle. Practical demonstrations, recitations, and the actual performance of the duties taught, comprised the major part of this instruction, and the final results showed that this method was successful.

Physical and military drills were conducted by companies under carefully selected instructors, and always under the supervision of a well-qualified Regular officer.²²³ Shortly after each company was organized, members of this company were detailed by roster for one week's duty with either an ambulance company or a field hospital company, and during the drill period they were on duty with these companies, and also received other instruction when practicable, though they were not excused from the instruction outlined in the regular course. By this means the suitability of officers for this type of work was readily determined.

Army Regulations, Manual for the Medical Department, and Manual for Courts-Martial, were taught the student not with the idea that he would thoroughly digest these works and be able to make decisions without reference to the text, but to thoroughly ground him in the principles underlying these regulations.²²³ They were also taught the use of these manuals, so that on occasion they would know where to look for the correct information. The instruction in the examination of recruits was entirely practical. Each officer was given personal instruction by the instructor, and was then given recruits to examine. Their errors were shown them, and every effort was made to perfect them in this work before they left camp. In handling paper work every officer was required to complete an entire set of the regular Medical Department forms from data furnished him, and the principles underlying the use of these papers were thoroughly explained to him. When field equipment of any kind was studied, the student officer was required to handle it himself. This method gave him an actual personal knowledge of the equipment.

As the student officers were direct from civil life, the field equipment of the Medical Department was naturally strange to them, differing in so many ways from that which they were accustomed to use in their practice. All of this equipment was carefully explained to them, and they were given the reasons for its use and also the reasons why the equipment they had used in civil life could not be used in the field.²²³

As many of these officers were being trained for front-line work, their instruction in map reading and sketching, while elementary was extremely thorough, so that they could readily read a map and on occasion send back an accurate description of where their dressing station or other unit was located.²²³

In the beginning no horses were furnished the camp, so equitation, though scheduled, could not be given.²²³ This period, therefore, was used by giving the class a short march of from 3 to 5 miles. No attempt at grading these marches was made at first, but later a new class was taken a very short distance at the beginning, to be increased as the officers became more hardened to the work. This was found to be an excellent method of rounding out the day and most officers felt much better for it. The equitation instruction itself was not conducted with the idea that these officers would be made finished horsemen, but their instruction was limited to the most elementary principles, teaching primarily the correct seat and how to control and handle a horse.

It was impossible to give a complete course in mess management in such a limited time, but a certain number of officers were detailed as assistants to the mess officer for one week at a time, and these officers were made familiar with the most approved methods used in this work.²²³

During the periods of the basic course allotted to hygiene and sanitation, the classes were given practical demonstrations as to how sanitary inspections should be made, and in the laboratory of field sanitary appliances they were not only shown the actual working of approved methods but were required to make drawings of appliances which they were most likely to find useful to them in the future.²²³

The salient aspects from a medical officer's standpoint of the following professional subjects as developed during the war were taught by instructors thoroughly familiar with the subjects: Military surgery, cardiovascular and pulmonary diseases, orthopedics, war psychoses, and neuroses.²²³

Instruction in sanitary tactics was confined to the principles of this science, and after a thorough grounding in them, these principles were put into effect, first, on the map in map maneuvers and later in actual maneuvers held on the reservation.²²³ Every effort was made to have the latter as realistic as possible, using the actual number of sanitary troops with their equipment that the strength of the command engaged called for. Details of men to act as wounded were made and these men were distributed about the battle field, properly tagged. The actual dressing of these men and their removal from the field was performed by the student officers and troops furnished for the purpose. The commands used in these maneuvers were never larger than a regiment. Complete maneuvers of a division in both offense and defense, with the proper allotment of sanitary troops, were held for the first four companies, but later companies remained so short a time that their instruction could not be brought to this point.

Only the first three companies as a whole completed the three months' course as outlined.²²³ Later companies gradually disintegrated on account of the pressing need of medical officers. As officers were required to fill details to divisions, etc., the average men in the companies were sent out first, leaving the best and the poorest. The best men were kept to be trained more thoroughly for important details and the poorest to give them the benefit of as much instruction as possible so as to raise their general efficiency.

As the camp progressed it was found that the original plan of instruction did not include certain important parts of the work, and special departments were instituted to cover these deficiencies.²²³ The first of these was a department for the inspection of communicable diseases, which afterwards became the School of Epidemiology. This was started October 13, 1917.²⁰⁸ Officers specially qualified for this work were given instruction in this department, consisting of lectures and detailed instruction combined with the actual inspection and handling of communicable diseases at this camp and at Camp Funston.²²³ The course was indefinite in length, and as the demand for officers qualified to do this work arose, the best instructed men were detailed.

The physical instruction of the officers at first was uniform, but on account of the decided range in age of these men, two classes for physical instruction were started, one division for all officers under 40 years of age, and the other for all those over 40.²²³ The former were given the regular course, but the latter received carefully graded instruction, so that no strain would be put upon an older and potentially weaker heart. This was done with the knowledge that officers of the second age group who have lived sedentary lives are easily injured if they are permitted to perform exercises of a more or less strenuous character, though later on, after a thorough and gradual development, they would possibly stand the same amount of strain as the younger men. This special physical instruction was under the direct supervision of officers specially qualified for this work. The older officers were watched closely, and when, in the judgment of the instructor, an officer was found who could not stand the hardships of any kind of Army work he was reported to the regular physical examining board of the camp, and if they agreed that any service would probably prove dangerous to him he was recommended for discharge. Some difficulty was experienced, at first, in getting the personal cooperation of these older officers, for naturally it was trying for them to start the course of exercise after years of a sedentary occupation. But after the results were seen the officers themselves were anxious to take advantage of the instruction. This class averaged 100 daily, and by steady training became able to do work which they were physically unable to accomplish a short time before. The exercises given were of a graded nature, beginning with gentle resistance exercises. These were gradually increased in degree, and breathing and boxing exercises were added as the class progressed.

Instruction in gas defense was carried out at first theoretically with naturally little success, but on November 16, 1917, a gas house was completed, after which the course was conducted in a very thorough manner.²²³ This course was the same as that outlined for the divisional camps (q. v.).

As medical officers at a training camp were decidedly separated from professional work it was thought that they should be kept abreast of the progress in medical science, particularly that of the military service. To accomplish this a department of current literature was organized and an editorial board selected from the best qualified officers in the camp.²²³ This board abstracted the current literature and once a week the entire student body was assembled and given the results of the labors of the board. The material was afterwards mimeographed for general distribution. It was not considered practical to include all branches at one session, so one week was devoted to surgery, another to internal medicine, etc.

SYLLABUS OF GENERAL INSTRUCTION

To carry out the instruction outlined above in a uniform manner, a syllabus covering all the important subjects was prepared.²²³ It might be considered that such a method would cause criticism, in that it limited the initiative of the individual instructor. This criticism in times of peace would be justified, but in the rapid training of officers for war service, uniformity of instruction was very necessary.

This syllabus is given in detail:²²⁴

DRILL INSTRUCTION

Drill Regulations and Service Manual for Sanitary Troops.

General instruction in forming company.

General principles, articles 1-24, inclusive.

Instruction in company formation for retreat.

School of the soldier, articles 27-38, inclusive, and 40-54, inclusive.

Instruction in formation for Saturday a. m. inspection, articles 220-221, inclusive.

School of the detachment:

Articles 55-73, inclusive.

Articles 74-79, inclusive.

Articles 80-89, inclusive.

Special attention to column of platoons and line of platoons:

Articles 90-92, inclusive.

Article 25, arm signals.

School of the battalion.

Mass formations.

Parades and reviews.

Litter and ambulance—litter drill.

General instructions, articles 93-97, inclusive:

(a) Manual for closed litter.

(b) Manual for open litter.

(c) Manual for ambulance litter drill.

(d) Manual for marching with litter.

(a), (b), and (c) at ambulance sheds; (d) on drill grounds.

Remarks.—Progressive instruction given as outlined.

Litter and ambulance drill began for each student company when they had progressed to article 74.

Instruction and exercise in giving commands.

Grading drill, giving every student an opportunity to exercise command.

On days when outdoor instruction was inadvisable, indoor quizzes and blackboard work were substituted.

No arbitrary number of hours were scheduled for each lesson, as each company progressed as rapidly as they became proficient and all completed the course in the prescribed number of hours.

SYNOPSIS OF COURSE ON PHYSICAL TRAINING

The following abstract on physical training gives commands only. Methods of execution were learned from Koehler's Manual of Physical Training, from attending physical drill, or from the instructor in physical drills.¹¹⁶

FORMATIONS

FALL IN; count FOURS. Take physical exercise interval; MARCH. Company, HALT. Company assemble on No. 1 (or 4); MARCH.

STARTING POSITIONS

Arms forward, RAISE. Arms, DOWN. Arms upward, RAISE. Arms sideward RAISE. Arms across back, PLACE. Arms to thrust, RAISE. Arms across chest, PLACE. Hands in rear of head, PLACE. Hands on shoulders, PLACE. Arms upward, thumbs locked, RAISE. Side straddle position, PLACE. Leaning rest position, PLACE. Squatting, hands on ground position, PLACE. Side straddle, arms upward, thumbs locked position, PLACE.

EXERCISES

The preparatory command and command of execution for all exercises not starting positions, are "Ready, EXERCISE." Exercises should alternate between arms, trunk, and legs to avoid monotony and fatigue. "Company, HALT." Discontinue any exercise. "Company, ATTENTION" brings from any position to attention.

First series

Eleven sets of three each.

1. Finger: Forward, backward, close, open, circular.
2. Right ankle: Hands on hips, PLACE. Down, up, in, out, circular.
3. Wrist: Forward, back, up, down, circular.
4. Left ankle: Hands on hips, PLACE. Down, up, in, out, circular.
5. Arms: Arms sideward, RAISE. Forward, backward, up, down, circular.
6. Right leg: Hands on hips, PLACE. Forward, backward, out, in, circular.
7. Shoulders: Arms to thrust, RAISE. Forward, backward, upward, downward, circular.
8. Left leg: Hands on hips, PLACE. Forward, backward, out, in, circular.
9. Neck: Hands on hips, PLACE. Forward, backward, right, left, circular. (Eyes closed in neck exercises.)
10. Trunk: Hands on hips, PLACE. Forward, backward, right, left, circular.
11. Arms: Forward, backward, upward, sideward, downward, sideward, circular.

Second series

1. Side straddle exercises: Ready, EXERCISE (two counts).
2. Side straddle triplet: Side straddle position, arms upward, thumbs locked (or fingers laced), PLACE. Downward, upward, right, left, circular.
3. Side straddle full bend: Side straddle position, arms upward, fingers laced, PLACE. Downward, upward, touch knuckles to ground, knees extended.

Third series

1. Leaning rest leg exercises: Leaning rest position, PLACE (two counts). Flex, right knee (two counts). Flex, left knee (two counts). Right leg position, PLACE. Alternate flexing knees (two counts). Company, ATTENTION.
2. Leaning rest arm exercise: Leaning rest position, PLACE. Flex arms (two counts). Company, ATTENTION.
3. Leaning rest leg sideward exercise: Right (two counts), left (two counts), both (two counts).

Fourth series

1. Squatting hopping circle-arm exercise: Squatting position, PLACE. Arms sideward, RAISE. Hop and circle arms (one count).

2. Squatting hands on ground leg exercise: Squatting hands on ground position, PLACE. Right, left, both. Company, ATTENTION.

3. Squatting—leaning rest exercise: Squatting hands on ground position, PLACE. Extend and flex both legs (two counts).

Always concluded with lung exercise: Inhale (raise arms upward slowly, inhaling through nose); exhale (return arms rapidly, mouth open to let air escape rapidly).

After any strenuous exercise give a few lung exercises.

Other series and groups of exercises were prescribed as the proficiency of the class permitted.

THE FIELD HOSPITAL

A. History.

1. Earliest knowledge.
2. Uses in previous wars.
3. Early uses in wars—this country.
4. Progress—in the transportation and personnel as well as material up to the present day.

B. Authorization and organization.

1. Paragraphs 157 to 167, M. M. D., pertaining to animal-drawn vehicles—later motorized companies.
2. Personnel (officers, Medical Department and Quartermaster Department. Enlisted men, Medical Department and Quartermaster Department).
3. Equipment—
 - Medical Department.
 - Quartermaster Department.
 - Ordnance Department.
4. Transportation—
 - Medical Department.
 - Quartermaster Department.
 - Civilian.
5. Instruction: Brief outline, including discipline—officers and enlisted men.

C. Administration.

1. Assignment of personnel—exact manner of acquiring full quota of officers and enlisted men, commanding officer, adjutant, etc.
2. Paper work.
 - a. Reports—daily, weekly, monthly, quarterly, emergency, semiannual, and annual.
 - b. Requisitions—form number. Quadruplicate.
 - I. Authority for same.
 - II. Disposition of same.
 - c. Property (complete).
 - I. Acquisition and replenishing of field supplies.
 - II. Accounting for same.
 - III. Responsibility and accountability.
 - IV. Inspection and condemnation—public animals and other property.
 - V. Survey of: (a) Purpose. (b) Relief from responsibility and accountability. (c) "Dropping" of property. (d) Durable property.
 - d. Company fund—hospital fund.
 - I. Mess officers and supervision of mess.
 - II. Mess sergeant and purchase of supplies.
 - III. Sources of revenue.
 - IV. Expenditure authorized and monthly statement of fund.
 - V. Manner of returning mess: (a) Keeping on daily slip absolute cost per meal for each article used. (b) Auditing purchases daily from all sources and initialing of vouchers by mess sergeant and mess officer. (c) Durable property.

D. Transportation.

1. Care of animals, wagons, harness, motors, etc.
2. Equitation, hippology, study of motors (internal parts, fuel—consumption of).
3. Motors, etc.

E. Duties of field hospital.—Duties acting in conjunction with ambulance companies—with evacuation hospitals—with evacuation ambulance companies. Their relations to regimental officers.*F. Duties and responsibilities of the commanding officer, field hospital company.*

1. Care of his personnel and transportation.
2. Care of troops on march—each night.
3. Selection of proper site for pitching field hospital company.
 1. Shelter—artillery fire.
 2. Marking with guidon to show approach.
 3. Proximity to roads and water—drinking, cooking, watering of animals.
4. Efficiency for prompt treatment and evacuation.
5. Records.
6. Orders.
7. Contact with directors.
8. Dead—identified—recorded and evacuated.
9. Detail of personnel so that a few men will always be available for immediate special duty.
10. Proper pitching of field hospital in one-half hour and ready to take care of patients.
11. Having all equipment on hand originally and keeping of such as is lost, broken, or used replaced.

G. Practical demonstration of field hospital (one afternoon).

ARMY REGULATIONS

CHAPTER I (FIRST 6 DAYS)

First lecture: Military discipline, general organization of the Army:

- a. Company, battalion, regiment, brigade, division.
- b. Staff departments, General Staff Corps, Territorial departments, etc.
- c. Honors, courtesies, and ceremonies.

Second lecture: Fifteen-minute quiz on last lecture.

- a. Leaves of absence.
- b. Officers traveling on duty.
- c. Retirement of officers.
- d. Resignation of officers.
- e. Deceased officers. New insurance act.

Third lecture: Fifteen-minute quiz on last lecture.

- a. Detached soldiers.
- b. Service records.
- c. Furloughs.

NOTE.—Service record and furlough blanks were given the class to be drawn and filled in as directed by instructor.

Fourth lecture: Fifteen-minute quiz on previous lecture. Papers of the day before turned in.

- a. Transfer of enlisted men to the Medical Department.
- b. Deserters.
- c. Discharges.
- d. Final statements.

NOTE.—Five discharge blanks and final statements were properly filled out by the class as directed by the instructor.

Fifth lecture: Fifteen-minute quiz on previous lecture. Papers of the day before turned in.

- a. Certificate of disability.
- b. Proceedings of disability boards.

NOTE.—Five certificates of disability blanks were properly filled out by the class as directed by the instructor.

Sixth lecture: Written quiz on previous lectures. Papers of the day before turned in.

CHAPTER II

Seventh lecture: Fifteen-minute review on common errors noted in written quiz.

- a.* Deceased soldiers. Letter made out notifying commanding officer of death of man in the detachment. Explanation of the new insurance act.
- b.* Extra and special duty.
- c.* Soldiers' Home.
- d.* Troops, batteries and companies (pars. 275, 276, 277, 281).

Eighth lecture: Fifteen-minute quiz.

- a.* Interior economy of companies.
- b.* Messing and cooking.
- c.* Company and mess funds (par. 327).

Ninth lecture: Fifteen-minute quiz.

- a.* Government Hospital for the Insane.
- b.* Public property and accountability.

Tenth lecture: Fifteen-minute quiz.

- a.* Surveys.
- b.* Inventory and inspection reports. Inspector General's Department.
- c.* Destruction of property.

NOTE.—Five survey blanks and inventory and inspection reports were properly filled in by students as directed by instructor.

Eleventh lecture: Fifteen-minute quiz. Papers of the day before taken up.

- a.* Adjutant General's Department.
- b.* Military correspondence. A letter with two indorsements was written.
- c.* Orders.

Twelfth lecture: Written quiz on previous five lectures.

CHAPTER III

Thirteenth lecture: Review of common errors noted on written quiz.

- a.* Muster roll.
- b.* Pay roll.

NOTE.—Five copies of each were turned over to the company to be completed by students.

Fourteenth lecture: Fifteen-minute quiz. Papers of previous lecture taken up.

- a.* Judge Advocate General's Department.
- b.* Quartermaster Department (papers made in course on quartermaster papers).

Fifteenth lecture: Fifteen-minute quiz.

- a.* Quartermaster Department continued.
- b.* Ordnance Department (papers made out in course on Ordnance papers).
- c.* Medical Department.
- d.* Engineer Corps—Signal Corps.

Sixteenth lecture: Oral quiz on the entire course.

Seventeenth lecture: Oral quiz on the entire course.

Eighteenth lecture: Written quiz on the entire course.

MANUAL FOR COURTS-MARTIAL

First lecture:

- a.* Source and kinds of military jurisdiction.
- b.* Classification of courts-martial.
- c.* Composition.

Second lecture: Fifteen-minute quiz.

- a.* General courts-martial.
- b.* Special courts-martial.
- c.* Summary courts-martial.

Third lecture: Fifteen-minute quiz.

- a.* Courts-martial jurisdiction.
- b.* Arrest and confinement.

Fourth lecture: Fifteen-minute quiz.

- a. Preparation of charge (specimen charges, p. 335).
- b. Action upon charges.
- c. Charges to be made out.

Fifth lecture: Fifteen-minute quiz.

- a. Courts-martial organization.
- b. Challenges.
- c. Arraignment.

Sixth lecture: Fifteen-minute quiz.

- a. Witnesses and depositions.
- b. Evidence.

Seventh lecture: Fifteen-minute quiz.

- a. Evidence continued.
- b. Charges to be made out.
- c. Maximum limits (p. 161).
- d. Forms for sentence (p. 369).

Eighth lecture: Written quiz.

EXAMINATION OF RECRUITS

1. Lecture:

- Army surgeon's responsibility to Government.
- Place for examination.
- Supplies for examination.
- Rules for examination—Tripler's Manual—Circulars, W. D., etc.

2. Lecture:

- Physical examination—head, chest, abdomen, etc.
- Rules for rejection of recruits.

3. Lecture: Physical examination continued.

4. Lecture and oral quiz: Papers—enlistment papers, service records, examination blanks, surgeon's certificate of disability, identification card, etc. Practice in filling out blanks.

5. Shoe fitting:

- Lecture and demonstration.
- The foot and the Army shoe (Munson).
- Practical methods of shoe fitting.

6. Shoe fitting:

- Lecture and demonstration.
- Practical shoe fitting.

7. Finger prints:

- Lecture and demonstration.
- Value of finger prints for identification.
- Demonstration of method.

8. Finger prints: Practice in taking finger prints.

9. Quiz: Written quiz on entire course.

PREVENTION OF CONTAGIOUS DISEASES

1. Demonstration of inspection, methods of handling active cases of exposed men, Schick test, etc. To sections of class—each one period—7 to 9 a. m.

2. Practical work in inspection, etc., for a period of one week. To sections of class—two periods daily, 7 to 9 a. m. and 3 to 5 p. m.

REGIMENTAL MEDICAL SUPPLIES

1. (a) Position of regimental sanitary troops in relation to other units, ambulance companies, field hospital companies, etc.

(b) Personnel: Officers—enlisted men—bandsmen.

(c) Duties of regimental detachments:

- 1. Officers—in camp—on the march—in combat.
- 2. Enlisted men.
- 3. Bandsmen.

4. General: Maintenance of fighting units. Difference from civil practice.

2. Explanation of tables: Expendable and nonexpendable (A. B. and C.).
3. First-aid packet—carried by every officer and enlisted man.
4. Officers' belts, contents of:
 - (a) Practical demonstration of belt and contents.
 - (b) Diagnosis tag. Proper method of making out.
5. Belt, hospital corps. Practical demonstration.
6. Regimental combat equipment:
 - (a) Practical demonstration, packing and unpacking mule.
 Setting up of regimental aid station.
 Showing contents of chest.
 Demonstration of Lyster bag.
 Hypochlorite from quartermaster.
 - (b) Explanation of—when and where set up, and class of work done there.
 - (c) Litters and where obtained. How carried.
 - (d) Nine boxes of dressings. How carried.
 - (e) How replenished—
 1. In camp.
 2. In combat.
7. Camp infirmaries:
 - (a) Equipment weight:
 - (b) Purposes when used—in camp—in combat.
 - (c) How transferred.
 - (d) Personnel attached.
 - (e) Notification as to location when serving other units. Camp infirmary reserve.
 Division of equipment for two or more parties of regimental or camp infirmaries.
8. Regimental hospital:
 - (a) Purposes.
 - (b) When used.
9. Accountability and responsibility for supplies of detached battalions.

DEMONSTRATION OF TRENCH SYSTEM

First Day: Lecture with blackboard demonstration

1. General outline of trench system:
 - (a) Firing trenches.
 - (b) Support trenches.
 - (c) Reserve trenches.
2. Location of system:
 - (a) Chosen.
 - (b) Forced position.
3. Trace of trenches:
 - (a) Enfilade.
 - (b) Defilade.
4. Wire:
 - (a) Types.
 - (b) Positions—
 1. In front of trenches.
 2. At sides.
 - (c) Lanes.
 - (d) Repair.
5. Depth and contour of trenches.
6. Brief description of difference between French and British systems.
7. Location of sanitary formations:
 - (a) Local dressing stations.
 - (b) Regimental aid stations.
8. Location of sanitary appliances:
 - (a) Latrines.
 - (b) Kitchens.
 - (c) Water shelters.

9. How water and food are carried to trenches; waste is carried out.
10. Gas alarms.
11. Electric lights and telephones.

Second day

1. Description of position. Location of enemy line of firing and reserve trenches.
2. Different steps in building a trench:
 - (a) Laying out trace.
 - (b) Posts in position.
 - (c) Wire laid.
 - (d) Trench dug.
 - (e) Trench sloped.
 - (f) Ditch for revetting poles.
 - (g) Woven revetment placed.
 - (h) Revetment braced back and tied.
 - (i) Ends of poles cut off.
 - (j) Central drainage ditch dug.
 - (k) Miniature piles driven.
 - (l) Walk laid.
3. Approach trench described and shown.
4. Sniper's pit:
 - (a) Size.
 - (b) Sand-bag revetment.
 - (c) Overhead cover.
 - (d) Loop holes.
 - (e) Field of fire.
 - (f) Camouflage.
5. British trench:
 - (a) Firing banquette.
 - (b) Slopes of wall.
 - (c) Sand bags—how laid.
 - (d) Head cover.
 - (e) Loop holes.
 - (f) Thickness of parapet.
 - (g) Field of fire.
6. French trench:
 - (a) Firing banquette.
 - (b) Amount of exposure of troops on firing step.
 - (c) Field of fire.
 - (d) Camouflage on British trench.
7. Exit of first drainage system:
 - (a) Built up paredos.
 - (b) Size of drainage ditch.
 - (c) Use of concrete.
 - (d) Thickness of concrete used.
8. Traverse protecting entrance to covered trench.
9. Covered trench:
 - (a) Height.
 - (b) Width.
 - (c) Lighting.
 - (d) Knife gate.
 - (e) Depth of overhead cover.
10. Surface drainage:
 - (a) Chute.
 - (b) Use of concrete.
11. Firing trench:
 - (a) Depth.
 - (b) Width.
 - (c) Height of concrete.

12. Traverse:
 - (a) Thickness.
 - (b) Depth of trench back of traverse.
 - (c) Width.
 - (d) Brush revetting.
13. Trace of trench with perpendicular walls.
14. Winding course of trench:
 - (a) Difficulty in litter transportation.
 - (b) Confusion in estimating distance and direction.
15. Exit on surface:
 - (a) Contour of lines.
 - (b) Disposal of surface water.
 - (c) Contour of parapets with view to concealment.
16. Approach trench to second line support.
17. Board revetment.
18. Small dressing station:
 - (a) Approach.
 - (b) Head cover over door—
 1. Against shell burst.
 2. For water shed.
 - (c) Roof of dressing station—
 1. Logs.
 2. Dirt.
 3. Logs.
 4. Dirt.
 5. Rock.
 6. Dirt.
 - (d) Timber support.
 - (e) Sump for drainage.
 - (f) Capacity.
 - (g) Type of cases handled.
19. Dugout dressing station:
 - (a) Traverse protecting door.
 - (b) Shaft—
 1. Depth.
 2. Revetment.
 3. Overhead cover.
 4. To shed water.
To protect from fire.
For concealment.
 - (c) Gallery—
 1. Gas curtains.
 2. Length.
 3. Timbering.
 4. Pitch.
 5. Construction of steps.
 6. Arrangement of electric lighting.
 - (d) Dressing station—
 1. Thickness of rood (25 feet).
 2. Timbering.
 3. Overhead planking.
 4. Side wall protection.
 5. Ventilation. How driven.
 6. Stove and stove pipe.
 7. Capacity.
 8. Drainage.

19. Dugout dressing station—Continued.
 - (d) Dressing station—Continued.
 9. Grenade trap.
 10. How extended.
 11. Lighting.
 - (e) Exit—
 1. Same as entrance.
 2. Necessity for both entrance and exit.
 3. Masked by curve in trench instead of traverse.
 4. Heavy log revetment.
20. Winding trench:
 - (a) Comparison with angular type.
 - Advantages.
 - Easier to pass.
 - Facility for better transport.
 - Difficulty to take in bombing attack.
21. Rabbit wire revetment:
 - (a) Combined rabbit wire and brush.
22. Latrine:
 - (a) Local trench—
 1. Raised 1 foot.
 2. Entrance concreted to prevent wearing down.
 - (b) "T" head construction.
 - (c) Width of trench to latrine.
 - (d) Roof of latrine—
 1. Open to provide access of light, sun, and air.
 2. Layer construction.
 - (e) Cubicles for seats—
 1. Concreted on bottom.
 2. Raised 3 inches from floor of trench.
 - (f) Type of seats—
 1. Seat on top of oil tin.
 2. Double boxed.
 3. For bucket.
 4. With legs.
 5. Single completely closed.
 - (g) Preparation of empty oil can for containers. Rope handles.
 - (h) Covers for filled cans.
 - (i) Urine tub with pole handle.
 - (j) How waste is carried out.
 - (k) Hints on sanitary care of latrine.
23. Water and wash room shelter:
 - (a) Overhead shelter.
 - (b) Walls.
 - (c) Floor concreted.
 - (d) Advantage of location.
 - (e) Water barrels.
 - (f) Wash-basin rack.
 - (g) Camouflage.
24. Electric wiring:
 - (a) When carried on trench wall.
 - (b) Conduits on trench crossings.
25. Flume over trench for surface water:
 - (a) Great necessity for disposing of surface water.
 - (b) Review of different systems of drainage used.
 - (c) Brief description of trench foot.

Third day at trenches

1. Questions: Review and added demonstration of parts of trenches not understood.
2. Brief talk on where men live and sleep.
3. Demonstration by a regimental detachment (enlisted):
 - (a) Five methods of taking a wounded man over the top.
 - (b) Handling litters around traverses.
 - (c) Difficulty in passing a litter through an occupied trench. How it may be avoided.
 - (d) Carrying a litter into and out of dressing stations of both types.
 - (e) Relative ease of transport through winding trench (circular).

REGIMENTAL DETACHMENT

First day. Use and internal administration

1. Size:
 - (a) Infantry.
 - (b) Cavalry.
 - (c) Field Artillery.
2. Duties in permanent camp:
 - (a) Care of infirmary—
 1. Description of infirmary building found in cantonments.
 2. Dressing room attendants.
 3. Dispensary attendant.
 4. Medical officer of the day.
 5. Kitchen.
 6. Ward—attendants.
 7. Squad room—
 - Alignment of cots.
 - Arrangement of cots.
 - Arrangement of equipment on Saturday.
 - Inspection.
 - Cuspidors.
 - Cleanliness.
 - Airing bedding.
 - (b) Sick call—
 1. Noncommissioned officer in charge of blotter.
 2. Clerk posting sick books.
 3. Attendant to take temperature.
 4. Two attendants. Dressings.
 5. Noncommissioned officer dispensing.
 6. Orderly to arrange sick incoming.
 7. Orderly to send out sick attended to.
 - (c) Typhoid prophylaxis—
 1. Attendant to arrange men in line as they appear on record.
 2. Attendant to spot arms with iodine.
 3. Noncommissioned officer clerk to check names on record.
 4. Attendant to boil needles.
 5. Attendant to fill syringes.
 6. Medical officer to give prophylaxis.
 7. Attendant to spot arms with iodine.
 8. Attendant to hasten orderly departure of men completed.
 - (d) Sanitary inspection—
 1. Noncommissioned officer of kitchens and latrines.
 2. Privates first class of latrines.
 3. Instructed carefully to report, not criticize.
 - (e) Duties of noncommissioned officer in charge of quarters.
 - (f) Instruction as per schedule. Importance of being earnest in all instruction.

Second day

3. Duties on the march:

(a) Before march begins—

1. Check supplies. Diagnosis tags.
2. Review duties to insure smooth performance.
3. Check carts, wagons, and all mule shoes.

(b) At start—

1. Absolute and correct promptness.
2. Be at detachment 20 minutes before time.
3. Verify watch with adjutant.

(c) During march—

1. Position in column—

- (a) Noncommissioned officer to each battalion.
- (b) One private to each company.
- (c) Balance in reserve at rear.

2. Position of medical officers—

- (a) Surgeon with commanding officer.
- (b) Two medical officers with each battalion.

3. Care of sick—

- (a) Must be seen by medical officer.
- (b) Must be cared for by Hospital Corps men.
- (c) Care to avoid overloading transportation.

4. Care of footsore—

- (a) Everybody's feet are sore.
- (b) Utilize halts.
- (c) Privates, Medical Department, must act as instructors to men.

5. Restrict passes to transportation—

- (a) Use utmost care that no sick man is forced to walk.

6. Care of water—

- (a) Allow use of no water from local sources unless known.
- (b) Post one private, Medical Department, at water to inform all company commanders that water is not safe.

7. Care during halts—

- (a) Allow no straying.
- (b) Loosen clothing.
- (c) Sit down and elevate feet when possible.
- (d) Drink water sparingly.

8. Save your men every needless fatigue. Utilize every moment of rest.

(d) At conclusion of march—

1. One junior medical officer and one private supervise water from local sources.
2. One junior medical officer supervises care of regimental water carts.
3. Two noncommissioned officers supervise digging of straddle trenches after site is selected.
4. Regimental surgeon obtains information as to hour when infirmary is available for his regiment.
5. Hold sick call rapidly, using 5 medical officers, 2 noncommissioned officers, and 10 privates.
6. Care of feet. Men must act as advisers, rather than attempt to care for every sore foot. All serious cases to be seen by medical officer.
7. Litter no cases unless absolutely necessary. Carry no litters by hand.
8. Before nightfall put out such dressings as may be necessary for morning, and pack remainder.
9. See that your men get plenty to eat, plenty of rest, and a good night's sleep.

Third day

4. During combat, open fighting:

NOTE.—To be taken up in detail on the actual terrain on maneuvers.

(a) Position during combat—

1. Noncommissioned officer to each battalion.
2. One private to each company.
3. Balance in reserve—

a. To get part of line worst punished.

b. To act as stretcher bearers.

(b) Position of aid station (brief, covered in other courses).

(c) Labor involved in litter transportation.

(d) Do not spare your men. Drive to limit of their strength.

5. During trench warfare:

NOTE.—To be taken up in detail in trenches during demonstration of trench system.

(a) Position—

1. Small dressing station.
2. Local dugouts.
3. Regimental aid station.

(b) Wounded evacuated on litter—

1. Never removed from litter from time they are laid on it.

(c) Evacuated after nightfall.

(d) No corps men in trenches until called from dugout.

(e) Practice in work with gas masks on.

(f) Absolute training for care of gassed cases.

Fourth day

6. Company punishment:

- (a) Reprimand.
- (b) Restriction.
- (c) Kitchen police.
- (d) Unpleasant fatigue.
- (e) Extra and special form of fatigue.
- (f) Courts-martial.

7. Reward the worthy.

8. Study each individual soldier and know every peculiarity and weakness before combat begins.

9. Keep your men constantly occupied.

10. Amusements and athletics.

11. Allow no officer from another organization to reprimand your own men.

12. Allow no dereliction of duty to go unpunished.

13. Punish every failure to salute any officer or any discourtesy shown to a sick man.

14. Allow no sloppy dress or behavior. Keep your men smart and alert.

15. Back your noncommissioned officers to the limit.

16. Allow no noncommissioned officer to abuse, hector, or tyrannize over the men.

17. Never raise the voice when reprimanding a man. Never show temper.

18. Set your men an example of what they should do:

1. In deportment.
2. Dress.
3. Punctilious performance of every duty.
4. Exact performance of duty.
5. Promptness.

EQUITATION

The ultimate aim of the course was that each officer should have a strong seat, be able to correctly apply the aids, be capable of covering distance with the least fatigue to himself and horse, and be able to ride broken country.

First month

First week:

- To fold the saddle blanket.
- To put on the blanket and sureingle.
- To put on and take off the watering bridle.
- To saddle.
- To unsaddle.
- To put on and take off the bit and bridoon bridle.
- Stand to horse.
- To lead out.
- Stirrups.
- To mount.
- To dismount.
- To take the reins in the hand and separate them.
- Position of the trooper mounted.
- Supplying exercises.
- To rest.
- Dismiss.
- Stand to heel.
- Mounted exercises at the walk.

Second week:

- Repetition of the first week and added—

- To gather the horse.
- To move forward.
- To halt.
- The trot.

Third week:

- Repetition of the first and second week and added—

- By the right and left flank.
- The oblique by trooper.
- General provisions regarding work on the track.
- Marching upon fixed points and a designated objective.
- Circling.

Fourth week:

- Repetition of the first, second, and third weeks and added—

- The gallop.
- The gallop depart.
- Changes of gait.
- To change hands.
- Supplying exercises, mounted.
- Posting.
- Care of horses and saddlery.

Second month

Repetition of the work of the first month, increasing the severity and difficulty of all exercises, and added—

- Points of the horse.
- Rules for the care of horses.
- Stables and stable management.
- Stable duty.
- Grooming.
- Watering.
- Feeding.
- Exercising.
- Sick horses.
- Shoeing.

Third month

Repetition of the work of the first and second months, requiring proficiency in all exercises, and added—Jumping.

SYNOPSIS OF COURSE OF INSTRUCTION IN MILITARY HYGIENE AND SANITATION, SANITARY INSPECTION, CIVIL FUNCTION OF MEDICAL DEPARTMENT IN OCCUPIED TERRITORY

CHAPTER I

Hygiene and sanitation, 20 hours; lectures and recitations on subject matter on the following heads:

1. Introduction.
 - Importance of subject.
 - Definitions.
 - Responsibility of medical officers and authority for actions.
 - Morbidity and mortality rates in civil communities, in military service, past and present, in peace and in war.
 - Influence affecting mortality rates in military service.
 - Common diseases in war, past and present.
 - Character of wounds in modern war.
2. The recruit.
 - Standards—physical, mental, and moral.
 - Training—effect, methods, objects to be attained, dangers of overtraining.
 - Personal hygiene.
3. Food.
 - Principles and constituents, nutritive function and value of each.
 - Rations; kind issued; nutritive value and use of each.
 - Field cooking.
4. Clothing and equipment.
 - Brief description of articles issued and used in the military service.
5. The march.
 - Distance, speed, duration, steps, and attitude.
 - Energy distribution and heat dissipation at rest, on march.
 - Water supply.
 - Regulation and discipline.
 - Sanitation on the march.
6. Quarters, barracks, cantonments.
 - Air—constituents and requirements, floor space, ventilation, heating.
 - Care of barracks, guardhouse, kitchens, mess room, etc.
 - Hospitals.
7. Camps.
 - Semipermanent, temporary, bivouac.
 - Location; sanitary survey of camp sites.
 - Soil—physical properties, purification, soil bacteria, etc.
 - Sanitation of camp—police, kitchens, latrines, bathing and washing, disposal of wastes, garbage, refuse, manure, etc.
 - Sanitary orders—form, purpose, scope.
 - Hygiene of the battle field.
 - Trench hygiene and sanitation, disposal of the dead, etc.
8. Water.
 - Amount required.
 - Occurrence in nature.
 - Examination of water—external qualities, chemical, microscopical, bacteriological
 - Purification—heat, chemical, mechanical, biological.

9. Sickness in the Army.

Cause—infective agencies, contact, carriers, etc.; agencies concerned in transmission.

Animals and insects concerned in transmission of disease:

Mosquitoes.....	} Classification, life cycle, habits. Rôle in transmission of disease. Methods of combating.
Flies.....	
Fleas.....	
Lice.....	
Bugs, etc.....	

Diseases transmitted by insects by direct inoculation—malaria, yellow fever, dengue, plague, typhus, filariasis, etc.

Diseases of infective intestinal type—typhoid, dysenteries, cholera, etc. Method of transmission, epidemiology, etc.

Diseases of infective respiratory type—the exanthemata, pneumonia, cerebrospinal fever, diphtheria. Method of transmission, epidemiology, etc.

Miscellaneous and deficiency diseases—scurvy, beri-beri, trench diseases, heart diseases, nervous diseases, alcoholism, etc.

CHAPTER II

Sanitary inspection, two hours; individual instruction.

Class divided into squads and given practical demonstration of matters to be investigated, and noted in making a sanitary inspection. Each individual then required to make a sanitary inspection and render a report thereof.

CHAPTER III

Civil function of Medical Department in occupied territory, one hour; subject covered in one lecture.

CHAPTER IV

Practical demonstration in laboratory of field sanitary appliances, six hours.

Class divided into squads, individuals given practical demonstration in construction and use of sanitary appliances. Individuals required to make and submit drawings of approved types of incinerators, latrines, field cooking apparatus, and sanitary appliances used in the field and in semipermanent and temporary camps, etc.

SYNOPSIS OF COURSE IN MILITARY SURGERY

LECTURE I

Projectiles and ballistics

Varieties of projectiles used in the belligerent armies:

Bullets—similarities and differences in structure, velocity, behavior, and effect of

German, French, English, Belgian, and American bullets at different ranges.

Shells—Construction, behavior, and effect of high explosives and shrapnel. Types of fuzes.

Miscellaneous projectiles—Bombs, grenades (hand and rifle), etc.

LECTURE 2

Wounds and wound treatment

Characteristics of injuries produced by bullets, shells, bombs, grenades, etc., upon various tissues:

Infection—

Prevalence and the factors responsible for it.

Pathologic and bacteriologic considerations.

Clinical features and manifestations.

Treatment—general principles; infection and the methods of dealing with it, based upon the experience of this war; discussion of different methods and their use.

LECTURE 3

Antisepsis and antiseptics

Chemistry and therapeutic employment of different antiseptic substances.

LECTURE 4

Gas infection—prevalence; factors involved in its production; pathologic and clinical manifestations; principles of treatment.

Tetanus: Prevalence; prophylactic and therapeutic measures employed; delayed tetanus.

Trench foot: Prevalence; factors involved in its production; pathology; principles of treatment; prophylaxis.

LECTURE 5

Wounds of the abdomen, chest, and head

Prevalence; characteristics; climatical manifestations; complications; principles of treatment.

Wounds of the buttocks

Principles of, and factors complicating treatment.

LECTURE 6

Fractures

Character of fractures encountered; prevalence of infection; complicating factors influencing treatment; principles of treatment; discussion of methods and splints used for transportation and treatment; after treatment.

LECTURE 7

Joint injuries

Characteristics (clinical appearance and manifestations).

Principles of, and factors complicating treatment; after treatment.

Amputation

Indications; types of amputations and discussion of their advantages; the "flapless amputation"; amputations in relation to the subsequent use of artificial limbs.

Resections

Indications; discussion of resections in relation to infected fractures.

LECTURE 8

Localization and extraction of projectiles

Methods of localization and their use. Extraction of projectiles; when to extract them and when to leave them.

Plastic surgery

Types of wounds requiring plastic repair; clinical and therapeutic considerations; Thiersch grafts; whole skin grafts; bone grafts in ununited fractures; transplantation of fat to fill in retracted scars; facial transplants in nerve suture, etc.

LECTURE 9

Evacuation of the wounded from the front

Problems involved in bringing in wounded from No Man's Land to dressing station; attention given at dressing station; conditions under which men are wounded and brought back as influencing their condition and the course and treatment of their injuries. The work of a field hospital; condition under which patients are received and the work done.

Evacuation hospitals; their function and factors influencing the work done. Evacuation of wounded from evacuation hospital to base; conditions at base. Convalescent hospitals; special hospitals for after treatment of fractures and joint cases; mechano-therapy; electro and hydro therapy; etc.

ORTHOPEDIC INSTRUCTION

LECTURE 1

The human foot: Its anatomy, physiology, examination, and the significance of its abnormalities. Symptoms and signs. Limitations of flexion. Abduction and pronation. Eversion, inversion. Low arches. Flat feet. Prominent scaphoid arthritis.

LECTURE 2

Quiz and recitations (Munson), one hour.

LECTURE 3

The disabilities of the soldier's foot and their treatment. Acute foot strain. Treatment, acute foot strain. Purpose, application. Further treatment. Ordinary foot strain. Flaccid feet. Rigid feet. Spastic feet. Flat feet. Treatment. Osseous flat foot. Affections of the anterior arch.

Callouses on sole over the metatarsal heads. Metatarsalgia treatment. Affections of the regions of the heel involving the tendo achillis. Involving os calcis. Treatment. Hallux rigidus, hammertoe, treatment. Deformities of the little toe.

Period 4: Quiz and recitations (Munson), one hour.

Period 5: Clinic, one hour.

Period 6: Shoe fitting for abnormal feet, one hour.

Period 7: Examination, one hour.

COURSE IN FIRST AID

Lecture (two hours)

1. Modern definition of first aid:
 - a. First aid in its relation to minor surgery.
 - b. Improvised minor surgery at aid and dressing stations.
2. The first-aid packets, application, results.
3. Cardinal conditions to be treated:
 - a. Hemorrhage—use of the tourniquet.
 - b. Shock—morphine and atropine, immobilization of patient.
 - c. Fatigue—hot drinks—rest—wounds (complicated with burns, etc., use antitetanic serum).
4. Effects heat and cold—treatment.
5. Dislocations and fractures—improvised dressings and splints as found in men's equipment and in the field.
6. Necessity for having trained assistants who know your personal ideas on treatment and handling of wounded.

MEDICAL DEPARTMENT IN CAMPAIGN

Eight hours were devoted to the study of the Medical Department in campaign, following the subject as outlined in the textbooks.²²⁴

A thorough knowledge of map reading was essential, and special emphasis was laid on the subject of orders, the student being impressed with paragraph 4, pertaining to the Medical Department.²²⁴

²²⁴ (1) Straub, Paul Frederiek, major, M.C.: *Medical Service in Campaign. A Handbook for Medical Officers in the Field*, Philadelphia. P. Blakiston's Son & Co., 1912, second edition.

(2) Munson, Edward Lyman, major, M.C.: *The Principles of Sanitary Tactics. A handbook on the Use of Medical Department Detachments and Organizations in Campaign*. Banta Publishing Co., Menasha, Wis., 1911.

A short course of instruction was given on the examination of lungs for tuberculosis, concerning which the details are outlined under special courses of instruction for officers.²²³

Profile making was well demonstrated, and the student was required to hand in a profile of some part of the map. The subject of overshots was dwelt upon and each student was required to hand in several problems to show that the subject was well understood.²²⁴

The next course included a study of each of the different stations established by the Medical Department, the internal administration, personnel and the conditions under which they are established; the line of communications with its different sections, the components of each section, and how the different zones related to each other.²²⁵ A chart was placed on the blackboard for each class, showing the zone of advance and the zone of the line of communications, and the component parts of each zone and how they operate.

Each student was quizzed on the lectures as given, and if the instructor thought necessary an examination was held at the end of the course, each man being graded accordingly.

PRINCIPLES OF SANITARY TACTICS

Twelve hours were devoted to the principles of sanitary tactics. In so far as visibility is concerned this subject was covered by means of projecting the line of sight and solving the problem by mathematics and by the profile method; each student was required to solve problems by both methods.²²⁶ The student was given enough instruction in tactics pertaining to the line to enable him to have an enlightened idea of what the commander of the forces was trying to do and to intelligently cooperate with him and give the proper instructions to his sanitary troops. The smallest unit (the battalion) was first studied both in advance, retreat, and defensive formations, explaining the use, position, and personnel of the sanitary troops. The regiment, the brigade, and the division were next studied, always laying particular stress upon the use of the sanitary personnel. The 12-inch map of Leavenworth was placed in front of the class and the position of the different units pinned on with the war game sets, and each student was required to show where he would establish his aid and dressing stations, the stations for the field hospitals, how the line of communications was brought in, how to trace a wounded man from the front to the rear, showing what organization he passed through and what records were made and the disposition made of him. Road space and the factor of time were emphasized. Students were quizzed upon each problem. A student was placed at the board, required to make a solution on the map and give his reasons. The rest of the class had their maps and followed his solution. When he finished each man in the class was asked to criticise his solution.

MAP PROBLEMS

Four hours were given to the study of map problems.²²⁷ A problem was given to the class, which was taken out and shown the terrain over which the problem was to be worked. Each man, individually, then worked his problem, wrote it out, and handed it in to the instructor.

WAR GAMES

Eight hours were devoted to this subject. The students had their maps, the large 12-inch map was put upon the wall, a problem was given to them, and students were designated to act as the chief surgeon, sanitary inspector, regimental surgeon, directors, and commanders of ambulance companies and field hospitals.²²⁴ Orders were written and given verbally and the students took sides, one side worked the problem and the other side criticized and vice versa.

BASIC COURSE

The following schedule of one week's work in the basic course shows the method of assignment of hours and instructors:²²⁵

HEADQUARTERS MEDICAL OFFICERS' TRAINING CAMP, FORT RILEY, KANS.

Schedule of instruction for the week ending May 25, 1918—Company No. 26

Monday, May 20:

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	War psychoses, neuroses, shell shock, etc.
10.30 to 11.30 a. m.	Orthopedics.
1 to 1.50 p. m.	Medical Department in Campaign (Assembly Hall C-4).
2 to 2.50 p. m.	Poison gases and liquid fire, etc.
3 to 3.50 p. m.	Ambulance company equipment, use and internal administration.
4 to 4.50 p. m.	Ambulance company equipment, use and internal administration.

Tuesday, May 21:

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Poison gases and liquid fire, etc.
10.30 to 11.30 a. m.	Orthopedics.
1 to 1.50 p. m.	Medical Department in Campaign (Assembly Hall C-4).
2 to 2.50 p. m.	Manual for Courts-Martial and Military Law.
3 to 3.50 p. m.	Ambulance company equipment, use and internal administration.
4 to 4.50 p. m.	Ambulance company equipment, use and internal administration.

Wednesday, May 22:

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Camp gymnasium.
9.30 to 10.20 a. m.	Manual for Courts-Martial and Military Law.
10.30 to 11.30 a. m.	Medical Department in Campaign (Assembly Hall C-4).
1 to 1.50 p. m.	Principles sanitary tactics (Assembly Hall C-4).
2 to 2.50 p. m.	Principles sanitary tactics (Assembly Hall C-4).
3 to 3.50 p. m.	Military surgery.
4 to 4.50 p. m.	Orthopedics.

Thursday, May 23:

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Manual for Courts-Martial and Military Law.
10.30 to 11.30 a. m.	Orthopedics.
1 to 1.50 p. m.	Military surgery.
2 to 2.50 p. m.	Civil sanitary function Medical Department in occupied territory.
3 to 3.50 p. m.	Principles sanitary tactics (Assembly Hall C-4).
4 to 4.50 p. m.	Principles sanitary tactics (Assembly Hall C-4).

Friday, May 24:

- 7.30 to 7.50 a. m.----- Physical drill.
- 8 to 9.20 a. m.----- Drill.
- 9.30 to 10.20 a. m.---- Manual for Courts-Martial and Military Law.
- 10.30 to 11.30 a. m.--- Orthopedies.
- 1 to 1.50 p. m.----- Military surgery.
- 2 to 2.50 p. m.----- Civil sanitary function Medical Department in occupied territory.
- 3 to 3.50 p. m.----- Principles sanitary tactics (Assembly Hall C-4).
- 4 to 4.50 p. m.----- Principles sanitary tactics (Assembly Hall C-4).

Saturday, May 25:

- 7.30 to 7.50 a. m.----- Physical drill.
- 8 to 9.20 a. m.----- Inspection, followed by drill.
- 9.30 to 10.20 a. m.---- Manual for Courts-Martial and Military Law.
- 10.30 to 11.20 a. m.--- Field hospital equipment, use and internal administration.

WEEKLY AIRDROME AND ASSEMBLY HALL ASSIGNMENT

Classroom work, Company 26, held at airdrome No. 3, except as noted above, unless otherwise directed by an instructor for his subject.

During inclement weather inside classroom work held at Assembly Hall C-1.

SPECIAL INSTRUCTION FOR OFFICERS

In December, 1917, instructions were received to establish schools in military roentgenology²²⁶ and military orthopedies.²²⁷ The officers ordered to take these courses were designated by the chiefs of these departments in the Office of the Surgeon General. Each course consisted of four weeks' basic training and four weeks' training in the special subject covered.

SCHOOL OF MILITARY ROENTGENOLOGY

The following letter of instructions from the Surgeon General gave the outline for the establishment of this school:²²⁶

WAR DEPARTMENT,
OFFICE OF THE SURGEON GENERAL,
Washington, December 6, 1917.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Riley, Kans.

Subject: School in military roentgenology.

1. A school in military roentgenology will be established as a special course for selected student officers, as part of the general scheme of instruction carried out in your medical officers' training camp.

2. The purpose of this school is to conduct training in roentgenology along military lines, from the military viewpoint, and in the military environment; and coincidently to develop its officers physically and train them in subjects which they should know under the conditions in which they would practice their specialty, including regulations, paper work, handling of men, and functions of medical officers other than those with fighting troops. By operating it as part of the training plan, much mileage can be saved and the presence of a large number of officers from whom to select will improve personnel.

3. About 60 roentgenologists will be required monthly. Classes should be arranged for on the following basis: At Medical Officers' Training Camp, Fort Oglethorpe, 35; at Medical Officers' Training Camp, Fort Riley, 25.

4. The instructor in roentgenology detailed by this office on the staff of instructors of the training camp will, under the supervision of the commandant thereof, be in direct charge of the course.

In addition to his educational duties, he will continuously investigate the qualifications and availability of medical officers under general training relative to detail for training as Roentgenologists.

5. The Roentgenologist on duty at the hospital will serve as assistant instructor, and his routine work at the hospital will as far as possible be arranged to that end. It is important that such routine duties should be demonstrated and utilized as part of the subjects of instruction.

6. To prevent duplication of apparatus, and to take full advantage of existing facilities and the many opportunities for clinical work, the course in military Roentgenology will be conducted in connection with the Roentgen laboratories of the base hospitals at Fort Oglethorpe, Ga., and Fort Riley, Kans.

7. The commanding officer of each of the above base hospitals will take measures to provide the necessary apparatus and equipment and will facilitate the work of training in every way.

8. The general instruction to be given will relate to the handling of apparatus, general methods of work, and normal X-ray anatomy.

Detailed information as to the general nature and scope of the work to be done will be furnished by the X-ray division of this office.

The course of instruction in Roentgenology, based thereon, will be prescribed by the commandant of the training camp after conference with the instructor in Roentgenology.

9. The course in general training and Roentgenology will cover a minimum of two months. In addition to instruction in other subjects, the course in Roentgenology comprises a total of 80 hours, covering 4 hours daily for 5 days each week of the second month.

10. No officer will be detailed for special training in Roentgenology until he shall have completed one month's course of general instruction in the training camp as prescribed in this letter.

Officers who qualify in this course, and are otherwise satisfactory, will be recommended for detail for the final course in New York City or elsewhere.

11. Student officers who, after one week's instruction, do not give evidence of proper aptitude for the work, will be returned to the general instruction in the training camps and other officers assigned in their places.

12. Officers under training as specialists in military Roentgenology will be quartered, and subsisted in the medical officers' training camp and subject to its discipline at all times.

13. Hours of instruction in Roentgenology will be arranged by agreement between the commandant of the training camp and the commanding officer, base hospital.

14. The schedule for the first month is as follows:^b

* * * * *

15. The schedule for the second month is as follows:^b

* * * * *

16. The receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. MUNSON, *Colonel, Medical Corps.*

The first course began January 28, 1918.²²⁸ All officers reserved by the Surgeon General's Office and all others desiring this type of work were first examined by the director of the school, and those qualified to take the course were detailed for instruction.²²⁸ At this examination, if any officers were found qualified to take the advanced course they were reported to the Surgeon General's Office. The first four weeks as contemplated by instructions issued by the Surgeon General consisted of essentially the same subjects as those taught in the basic course, but with the difference that fewer hours were devoted to some subjects and others of importance to these officers introduced. In the second month 100 hours, including drill periods, were devoted to more or less military instruction of a general nature, and the remaining time (80 hours) was

^b See pp. 78, 79.

taken up by special instruction in Roentgenology. This time for X-ray instruction was afterwards increased to 108 hours.

The training given consisted of instruction in the fundamental physics of the X-ray, normal and pathological anatomy, common injuries and dislocations, lesions of the lungs and heart, the common diseases of the gastrointestinal tract, the principles involved in the localization of foreign bodies, familiarity in the use of the base hospital equipment and dark-room technique.²²⁸

Some of the trained Roentgenologists who were qualified to take charge of a Roentgenology department, desired to have more training along diagnostic lines.²²⁹ To help these officers the director gave a series of three lectures a week, using evening hours. These lectures were well attended.

In this work the X-ray department at the base hospital, Fort Riley, was utilized and several adjoining rooms were used as classrooms.²²⁸

In addition to the regular classes in the school, 60 officers who were reported as trained Roentgenologists and assigned to this camp for military training were examined and those found not proficient were given further instruction in this branch.²²⁹

The school was closed May 9, 1918.²¹⁹

The following is a copy of the schedule provided for this school for one six-day period:²³⁰

Schedule of instruction for week ending March 16, 1918, fifth week.

THIRD SCHOOL FOR MILITARY ORTHOPEDICS AND ROENTGENOLOGY

(Designated Student Officers Companies Nos. 19 to 23, inclusive)

MONDAY, MARCH 11

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Military hygiene and sanitation.
10.30 to 11.30 a. m.	Military hygiene and sanitation.
1 to 4.50 p. m.	Orthopedics (School for Military Orthopedics, south end mess hall, F. H. 16).
1 to 4.50 p. m.	Roentgenology (School for Military Roentgenology, section E, base hospital).

TUESDAY, MARCH 12

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Military hygiene and sanitation.
10.30 to 11.30 a. m.	Principles sanitary tactics (assembly hall C-4).
1 to 4.50 p. m.	Orthopedics (School for Military Orthopedics, south end mess hall, F. H. 16).
1 to 4.50 p. m.	Roentgenology (School for Military Roentgenology, section E, base hospital).

WEDNESDAY, MARCH 13

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Military hygiene and sanitation.
10.30 to 11.30 a. m.	Principles sanitary tactics (assembly hall C-4).
1 to 4.50 p. m.	Orthopedics (School for Military Orthopedics, south end mess hall, F. H. 16).
1 to 4.50 p. m.	Roentgenology (School for Military Roentgenology, section E, base hospital).

THURSDAY, MARCH 14

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Military hygiene and sanitation.
10.30 to 11.30 a. m.	Principles sanitary tactics (assembly hall C-4).
1 to 4.50 p. m.	Orthopedics (School for Military Orthopedics, south end mess hall, F. H. 16).
1 to 4.50 p. m.	Roentgenology (School for Military Roentgenology, section E, base hospital).

FRIDAY, MARCH 15

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	Principles sanitary tactics (assembly hall C-4).
10.30 to 11.30 a. m.	Military hygiene and sanitation.
1 to 4.50 p. m.	Orthopedics (School for Military Orthopedics, south end mess hall, F. H. 16).
1 to 4.50 p. m.	Roentgenology (School for Military Roentgenology, section E, base hospital).

SATURDAY, MARCH 16

7.30 to 7.50 a. m.	Physical drill.
8 to 9.20 a. m.	Drill.
9.30 to 10.20 a. m.	War psychoses, neuroses, shell shock, etc.
10.30 to 11.30 a. m.	Military hygiene and sanitation.

WEEKLY ASSEMBLY HALL ASSIGNMENT

Inside classroom work held in north end of barracks No. 1, except as noted above, unless otherwise directed by an instructor for his subject.

SCHOOL OF MILITARY ORTHOPEDICS

The School of Military Orthopedics was established in accordance with instructions from the Surgeon General.²²⁷ The first course began in January, 1918.²³¹ When this course started, quarters for instruction were furnished at the base hospital, Fort Riley. A four weeks' course covering intensive instruction in this work was the basis for the school, but especially qualified men were kept on longer to round out such special lines of work for which they were best suited.²³¹

The letter from the Surgeon General which ordered the establishment of the school gave a clear outline of the instruction to be given it.²²⁷

DECEMBER 7, 1917.

From: The Surgeon General, United States Army.

To: Commandant, Medical Officers' Training Camp, Fort Riley, Kans.

Subject: School in military orthopedics.

1. A school in military orthopedic surgery will be established, as a special course for selected student officers, as part of the general scheme of instruction carried out in your medical officers' training camp.

2. The purpose of this school is to conduct training in orthopedic surgery along military lines, from the military viewpoint, and in the military environment; and coincidentally to develop its officers physically and train them in subjects which they should know under the conditions in which they would practice their specialty, including regulations, paper work, handling of men, and functions of medical officers other than those with fighting troops. By operating it as part of the training plan, much mileage can be saved, and the presence of a large number of officers from whom to select will improve personnel.

3. About 40 orthopedic surgeons will be required monthly. Classes should be arranged for on the following basis: At Medical Officers' Training Camp, Fort Oglethorpe, 25; at Medical Officers' Training Camp, Fort Riley, 15.

4. The instructor in orthopedic surgery detailed by this office on the staff of instructors of the training camp will, under the supervision of the commandant thereof, be in direct charge of the course.

In addition to his educational duties, he will continuously investigate the qualifications and availability of medical officers under general instructions relative to detail for training as orthopedic surgeons.

5. The orthopedic surgeon on duty at the hospital will serve as assistant instructor, and his routine work at the hospital will as far as possible be arranged to that end. It is important that such routine duties be demonstrated and utilized as part of the subjects of instruction.

6. To prevent duplication of apparatus and to take full advantage of existing facilities and the many opportunities for clinical work, the course in military orthopedic surgery will be conducted in connection with the orthopedic work of the base hospital at Fort Riley, Kans.

7. The commanding officer of the above base hospital will take measures to provide the necessary apparatus and equipment, and will facilitate the work of training in every way.

8. The general instruction to be given will relate to the principles of orthopedic surgery, the mechanics and fitting of apparatus, and the diagnosis and treatment of foot conditions.

Detailed information as to the general nature and scope of the work to be done will be furnished by the orthopedic division of this office.

The course of instruction in orthopedic surgery, based thereon, will be prescribed by the commandant of the training camp, after conference with the instructor in orthopedic surgery.

9. The course in general training and orthopedic surgery will cover a minimum of two months. In addition to instruction in other subjects, the course in orthopedics will comprise a total of 80 hours, covering 4 hours daily for 5 days each week of the second month.

10. No officer will be detailed for special training in orthopedic surgery until he shall have completed one month's course of general instruction in the training camp as prescribed in this letter.

Officers who qualify in this course, and are otherwise satisfactory, will be recommended for detail for the final course in New York City or elsewhere.

11. Student officers who, after one week's instruction, do not give evidence of the proper aptitude for the work, will be returned to general instruction in the training camps and other officers assigned in their places.

12. Officers under training as specialists in military orthopedics will be quartered and subsisted in the medical officers' training camp and subject to its discipline at all times.

13. Hours of instruction in orthopedic surgery will be arranged by agreement between the commandant of the training camp and the commanding officer, base hospital.

14. The schedule for the first month is as follows:^b

* * * * *

15. The schedule for the second month is as follows:^b

* * * * *

16. Receipt of this letter to be acknowledged.

By direction of the Surgeon General:

E. L. Munson, *Colonel, Medical Corps.*

The practical orthopedic work was taught at the base hospital, Fort Riley, where quarters were furnished this school.²³¹ A ward for 32 patients was set aside for orthopedic cases. One-half of one of the temporary two-ward buildings was assigned for the out-patient clinics and for classrooms for the school. A small room for cobblers was also provided. In addition to the patients in the hospital itself, an out-patient clinic, with an attendance of from 30 to 90 patients daily, was conducted. Several dissected upper and lower extremities were procured from the University of Nebraska for the use of the school.²³²

^b See pp. 78, 79.

The subject of orthopedic surgery was tabulated by the senior instructor, and from this tabulation the instruction was conducted, available clinical material being used to illustrate the different pathological lesions studied.²³³ The students were required, as far as possible, to make the necessary examinations, prepare and adjust splints, etc. After the course was completed student officers who were not immediately ordered away were used as assistants in the orthopedic department of the hospital.

In addition to the intensive course for the orthopedic specialists, the instructors attached to this school gave a short course in military orthopedics in the general basic course of the camp.²⁷

The following is an outline of the instruction:²⁷

Lecture 1 (one hour): The human foot—its anatomy, physiology, examination, and the significance of its abnormalities; symptoms and signs; limitations of flexion; abduction and pronation; eversion, inversion, low arches. Flat feet. Prominent scaphoid arthritis.

Quiz and recitations, Munson (one hour).

Lecture 2: The soldier's foot and the military shoe.

Lecture 3 (one hour): The disabilities of the soldier's foot and their treatment; acute foot strain; treatment, acute foot strain; purpose, application; further treatment; ordinary foot strain; flaccid feet; rigid feet; spastic feet; flat feet; treatment; osseous flat foot. Affections of the anterior arch. Callouses on sole over the metatarsal heads; metatarsalgia, treatment. Affections of the region of the heel involving the tendo achilles; involving the os calcis, treatment. Hallux rigidus, hammer toe, treatment. Deformities of little toe.

Quiz and recitations from Munson (one hour).

Clinic (one hour).

Shoe fitting (one hour).

Shoe alterations (one hour).

Lecture 4: Acute sprains, treatment; sequelæ of acute sprains; chronic sprains; peripheral nerve injuries; fractures and dislocations.

Lecture 5: Fractures and dislocations; their treatment; malunited and ununited; fractures and their treatment; transplantation of the bone and some uses of the bone graft.

Lecture 6: Disabilities of the knee joint. The mechanical treatment of fractures under war conditions.

Lecture 7: Orthopedic surgery in general: Necessity for the early application of the principles of orthopedic surgery to conserve function; preventing of deformities and obtaining best final result.

Lecture 8: War orthopedic surgery: Reconstruction, braces, prosthesis; positions of election ankylosis following gunshot injuries of joints.

Lecture 9: Suture of nerves and alternative methods of treatment by transplantation of tendons.

Lecture 10: The rehabilitation of the soldier mentally, physically, and occupationally.

SANITARY SCHOOL

In addition to the regular instruction in hygiene and sanitation given the training companies, a special course was conducted in order to train officers for the duty of sanitary inspectors, commanders of sanitary squads, etc.²⁰³ After two months' instruction in the basic course, officers were detailed to this school and given six weeks' instruction in practical sanitation. These officers were detailed as assistant sanitary inspectors in this camp and Camp Funston. They were required to make both general and special inspections and to turn in carefully written reports. All of their work was under the thorough super-

vision of well-qualified instructors, and after the reports of inspections were made the student was required to go over his own report and defend its recommendations.

Special demonstrations in practical sanitation, including inspections of dumps, water chlorination plant, excreta disposal systems, sanitary appliances, etc., were also given.²³⁴ Officers found qualified were reported to the Surgeon General's Office for assignment.

Early in August, 1917, the need of a sanitary laboratory for teaching and experimental purposes was clearly realized. Every known field sanitary appliance was constructed on a level area in the center of the camp.²³⁵ All officers were required to study these appliances and make drawings of the approved types, so that they would be thoroughly familiar with them when assigned to duty with troops.²³⁶ In addition to this, scientific experiments were carried out to determine the relative value of all such appliances. Interesting data were obtained and embodied in reports to the Surgeon General's Office. Every appliance which was built was constructed according to the plans given and, after construction, was given a thorough scientific trial under field conditions. In these experiments not only was the result obtained thoroughly analyzed, but every factor entering into the operation of the appliance was studied.

The fuel consumption of the different types of incinerators was studied with a view of determining which was the most economical under different conditions.²³⁶ Several new incinerators were invented and given practical trials. Among these was a multiple shelf incinerator which, on account of the great economy in fuel, was a great advance on the incinerators now in use. This incinerator was tested as to its capacity under varying conditions of temperature and wetness or dryness of the garbage.²³⁷ Careful experimentation was also conducted to determine what degree of heat could be developed with safety to the shelves and shelf supports. In April an exhaustive test of this incinerator was made. The entire daily output of garbage from Camp Funston (18,023 pounds) was completely incinerated with a total amount of 200 pounds of wood.²³⁸

Carefully drawn working plans were made of all appliances which were found satisfactory in any way and these plans were furnished the Surgeon General's Office.²³³ Models of all approved appliances were constructed and exhibited at the American Medical Association in Chicago in June, 1918.²²⁰ These models were afterwards sent to the Army Medical Museum, Washington.

Plates and descriptions of the sanitary appliances which were found to be most satisfactory were afterwards published by the War Department.²³⁸

During the winter of 1917-18 the severity of the weather prevented much outside work, so a complete workshop was fitted up indoors where experiments were made with models to determine whether modification of existing appliances would tend to greater efficiency or economy of time and material.²³⁷

Special instruction was given by this school to a large number of selected enlisted men.

The Sanitary School was closed July 1, 1918.²²⁰

FIG. 1.—This and Figure 2 show general views of the sanitary field appliances constructed at Medical Officers' Training Camp, Fort Riley, Kans.

FIG. 9

FIG. 10

By special arrangement with the authorities at Camp Funston, and under their supervision, the epidemiological work at that camp was handled by the School of Epidemiology, as there was a much larger field for instruction work at the larger camp.²⁰⁸

FIG. 11

The epidemic of meningitis at Camp Funston, which started on October 16, 1917, was handled and later controlled by this school, though they did not start on the work until November, 1917.²⁴⁰

An isolation camp was established at Camp Funston, and by special arrangement was put under the direction of this school, and one of the instructors was placed in charge of it.²³⁹ All contacts were sent to this camp and were carefully inspected twice daily by students of the School of Epidemiology. From 900 to 1,200 men were constantly interned in this camp.²³⁹

SCHOOL FOR TUBERCULOSIS AND CARDIOVASCULAR EXAMINERS

In order to meet the need of trained men for cardiovascular and tuberculosis examinations, qualified instructors were sent to the training camp and officers with some experience in this work were given a thorough course of indefinite length along practical lines. When an officer was found qualified by the instructors he was reported by name to the Surgeon General and held for special detail from his office. If, after one or two weeks of instruction, an officer was found inapt in this particular line he was returned to the general course to be used otherwise.²¹⁰

FIG. 18

TUBERCULOSIS EXAMINERS

The following is a syllabus of instruction given tuberculosis examiners:²⁴¹

EXAMINATION OF LUNGS FOR TUBERCULOSIS

I. History:

- Family.
- Intercurrent disease.
- Repeated colds, pneumonia, pleurisy.
- Story of frequent pains in shoulder tips, abdomen, and backache.
- Social condition.

II. Present history:

- Cough.
- Night sweats.
- Chills and fever.
- Loss in weight.

FIG. 19

FIG. 20

FIG. 21

III. Inspection of chest:

Shape of chest.

Developmental defects of body.

Lung excursion; how to obtain, value.

Retractions; supraclavicular or apical; intercostal.

Heart, apex impulse, rate, relation to tuberculosis examination.

IV. Methods of percussion; direct; indirect; location; proper stroke; relation to respiration.

Tuning of individual chest and procedure of percussion.

FIG. 22

Land marks:

Liver dullness; mobility of lower border of lung.

Heart area.

Traube space, liver; spleen; stomach; heart.

Kernig isthmus.

Relation to lungs.

Difference in pitch over right and left apex normally.

Value of percussion in lung examination:

Cavities.

Areas of dullness.

Areas of higher pitched percussion note.

FIG. 23

V. Auscultation:

Methods of auscultation—

Proper stethoscope.

Position of the patient.

Explanation to the patient how to breathe during examination and when to cough.

Obstacles interfering with proper breathing.

Starting point for examination.

Breath tones:

Bronchial.

Bronchovesicular.

FIG. 24.—Drying platform for horse-manure, before incineration

Vesicular.

Amphoric.

Râles:

Subcrepitant.

Crepitant.

Large crepitant.

Mucus.

Fine shower of crepitant râles.

Constancy.

Diagnostic value of râles.

False râles:

Marginal, sternal, sterno-clavicular.

Muscular sound simulating râles.

FIG. 25

V. Auscultation—Continued.

Vocal resonance and fremitus:

Demonstration by bony contacts.

How produced.

Normal differences.

Value in diagnosis.

VI. Sputum examination:

How specimen should be obtained.

Findings.

Value of findings; positive; negative.

VII. X-ray examination:

Methods—

Single plate.

Stereoscopic.

Fluoroscopic.

What X ray will show—

Massive consolidations.

Calcified glands.

Shadows of the hilus or helix.

Radiations (thickening along bronchial trunks).

Cavities.

Acute inflammations; hazy outline of acute inflammatory processes as contrasted with sharper outline of older processes.

Chest deformity; drooping of ribs on side of old tuberculosis lesion.

Diagnostic value.

VIII. Résumé:

Pathology of lung tuberculosis; usual point of beginning of tuberculosis process and its dissemination.

Border-line cases.

Observation for a time may be necessary or advisable.

Degree of immunity to the tuberculosis process—differing in various patients and in the same patient at various times.

Tuberculin test.

Viewpoint of the Army surgeon or examiner—

1. Nonadvancing chronic tuberculous focus.

2. Advancing chronic tuberculous focus.

3. Deep active peribronchial focus.

4. Chronic healed peribronchial focus.

5. Tuberculous pneumonic process.

CARDIOVASCULAR EXAMINERS

The intensive course in physical diagnosis as applied to cardiovascular disease was conducted along the lines suggested in the following synopsis of lectures:²⁴²

LECTURE I

Diseases producing highest rates of mortality and discharge among soldiers; causes, prevention.

The heart: Heart sounds; effect of exercise; blood pressure; hypertrophy; dilatation. Effect on heart and body of strenuous campaign; proneness to infectious diseases and complications. Valvular disease: Variation from the older stated symptoms on young healthy soldiers; recognition; murmurs (using graphic charts of lesions from Greene's Medical Diagnosis); functional; systolic; diastolic; weight of rheumatic and infectious history. Valvular disease and its importance in recruiting service.

Examination of candidates: Methods; necessity of a personal stethoscope; scant pressure with bell; quiet room essential; couch; candidate stripped to waist, standing in front, general observation rapidly as to general condition, color, cyanosis, pulsation at cardiac region,

veins of neck; note hands as to venous stasis, clubbed fingers. Capillary pulse; count pulse; observe condition of arteries; quality and tension of pulse. Location of apex; proper method of percussion; outline outer border at fifth interspace and right border third interspace, right edge of sternum, noting, in centimeters, distance in or out from nipple line and right border of sternum. Auscultation: Heart sounds as observed (1) over apex; (2) third interspace, left sternum; (3) second interspace, right sternum; (4) lower left sternum; also transmission of sounds from these areas, then place in left lateral position and observe same; the difference from dorsal position; the accentuations and murmurs; count pulse in dorsal position. Exercise test: Hopping 100 times on one foot; count pulse immediately over apex with stethoscope; note accentuations and murmurs "1 to 4"; in two minutes recount pulse; then observe, in dorsal position, areas "1 to 4"; again in left lateral position. Systolic murmurs at apex are common (letter, Surgeon General, October 25, 1917 "Accept without hypertrophy"); the most difficult murmur to diagnose early and causing the greatest trouble in service; the mitral stenosis, early increase of dullness to right of sternum; accentuation of P_2 , becomes split sound after exercise; accentuation or drumming of systolic sound at apex; a presystolic thrill is found at times, a presystolic murmur; crescendo obliterating the sharp beginning of the systole, blending with the systole; then an early diminishing diastole, this increasing gradually, then comes fibrillation; subjective symptoms; resultant hypertrophy.

Aortic insufficiency next in importance, the only pure diastolic murmur that may be transmitted over the cardiac area heard best in the aortic area (3), transmitted to vessels of neck, difference in symptoms from young men and old hospital cases, blood pressure generally low in these cases. Corrigan pulse only marked with high blood pressure; capillary pulse evident; pistol shot femorals, resulting hypertrophy. Triuspid insufficiency not common, symptoms; systolic murmur at (3) right hypertrophy. Triuspid stenosis rare; symptoms, diastolic murmur, venous stasis. Pulmonary insufficiency and stenosis rare, usually congenital; murmurs transmitted to left shoulder hypertrophy. One or more valves may be involved at the same time; results. Questions.

LECTURE II

Compensation, fatigue, tachycardia; causes; types, hyperthyroidism, localities of exophthalmic goiter; tuberculosis; fevers. Arrhythmia, premature beats, sinus arrhythmia, fibrillation, rare in recruits. Bradycardia, block, arteriosclerosis, hypertension, aneurism and dilated arch.

Duties of examiner: To hold in service; to exclude the afflicted or undesirables; to determine fitness for special service of those otherwise to be rejected. Men desiring to serve will conceal lesions, men feign symptoms to obtain exemption; use drugs, as digitalis and glonoin, or chew cordite.

Examining boards, unless properly prepared, may overlook important cases; they are certain to turn up again, as a loss to the Government; the importance of previous history in questionable cases; nomenclature of disabilities (Manual of the Medical Department, 1916, p. 455) standard for acceptance, rejection, or discharge, waiver of disability for special service.

Report of examinations: Forward to Surgeon General, through division surgeon, report required. Lists form: (1) Name; (2) abnormal signs for which case was referred; (3) diagnosis; (4) recommendation, accept, reject, or waiver of disability for restricted service.

When organization examination completed; totaled officers and men; strength obtained from regimental adjutant; those examined; percentage constitutes regiment totals; the disposition percentage constitutes total examined; sheets signed. Entire camps totaled same manner, final totals summarizing work of examiner, sent to Surgeon General through camp surgeon. Special significant factors are entered under remarks; other examinations on special request of commanding officers. Special boards and their functions. Questions.

Clinical demonstration of method of cardiovascular examinations.

SCHOOL FOR LINE OF COMMUNICATIONS SERVICE^k

This school was organized in accordance with instructions from the Surgeon General. The first course commenced January 1, 1918. Officers who were especially assigned to this duty by the Surgeon General's Office, and all others who for various reasons were not considered suitable for first-line work, were required to take this course instead of the regular basic course of instruction. Six courses were given, extending to the last of June, 1918. The schedule prepared for this course was identical in character with that used for the basic course, with the difference that the hours given to certain subjects were fewer in number, and also some of the subjects treated in the longer course were omitted.

SCHOOL FOR ADJUTANTS

A special course for the instruction of officers for duty as adjutants of evacuation and base hospitals was begun November 20, 1917.²¹² Specially qualified men were selected and given thorough instruction in the details of an adjutant's work. They were then sent to the base hospital at Fort Riley to serve as assistants to the adjutant. After one month's duty in this capacity they were returned to camp and a special report on their efficiency was made by the hospital authorities. If found qualified they were assigned to such duty, but if not they were returned to a training company and assigned as considered best. This instruction was discontinued in the spring of 1918 on account of the detailing of Sanitary Corps officers to this duty.

GENERAL COURSE OF INSTRUCTION FOR ENLISTED MEN

The recruits arriving at camp were met at the train by officers and non-commissioned officers and brought immediately to camp.²⁴³ After they were checked at headquarters they were issued blankets and cots and divided into sections of from 48 to 68 men each, depending on whether they were to be quartered in pyramidal or hospital ward tents (for some months all recruits received at camp were quartered in tents). They were then instructed in several of the most important Articles of War.

They were next carded.²⁴³ Each card showed the man's name, age, occupation, how long employed, pay received, education, and previous service, if any. The section number was entered on each card. These cards were then checked against the list at headquarters. The cards were then examined carefully and from them a list of men who appeared to be good material for noncommissioned officers was made. In such selection preference was shown to those who had received at least one year in college work, who had been foremen or who had occupied positions in civil life which entailed responsibility. The men selected were then given a personal examination and finally those considered favorable material were detailed as lance corporals in the proportion of 1 lance corporal to each 8 privates. If the number of men who were well educated and well qualified was great, the proportion was increased. This rapid selection of lance corporals of course eliminated from consideration for the time being a large number of steady, worthy, reliable men who, in time, would make excellent non-

^k For substance of instructions, see Camp Greenleaf School for Line of Communications Service, p. 78.

commissioned officers, but a standard for rapid selection had to be formulated, and if those selected did not make good, they were reduced and others who were showing rapid advance in discipline, leadership, etc., were detailed in their places.

All sections were sent out to drill at 7.30 a. m., and were drilled from that time to 9.30 a. m. by a detail of medical officers selected from those in the training companies who had shown most ability in the work.²⁴³ For the first half hour they received physical instruction from Koehler's Manual and for the remaining time squad drill, school of the soldier, and school of the squad. The rule laid down was 10 minutes drill followed by 5 minutes rest. During the drill period the work of the officers was supervised by an assistant instructor who checked carefully the character of the drill given by the various instructors and made notes of officers who were satisfactory or unsatisfactory. Those found unsatisfactory were immediately relieved and others detailed in their places. The number that had to be relieved was fortunately very small. In addition to the assistant instructor, four inspectors were detailed from the best qualified officers and these assisted the instructors in the minor points and technicalities of the work. From 9.30 to 10 a. m. the recruits were drilled as sections by their section leaders, and from 10 to 10.30 a. m. there was customarily a competitive drill by sections.

Throughout this instruction in foot drill the aim was to inculcate alertness, soldierly bearing, and prompt response to the word of command.²⁴³ Great stress was laid upon the point that all movements must be carried out strictly in accordance with cadence. It was intended that this drill should serve fully as much to inculcate obedience and respect to superiors as it did to teach smartness in formation.

At 10.30 a. m. a medical officer lectured to the lance corporals on anatomy, physiology, or some allied subject.²⁴³ This lecture was short, and at 11.15 the corporals returned to their squads and imparted to them the instruction just received. This increased the standing of the lance corporal with his squad by stamping him as a man who knew a little more than his comrades and made the enforcement of obedience to his commands somewhat easier. It was recognized that the instruction that these lance corporals gave might be in some particulars incorrect. Experience showed, however, that the practical knowledge the men got of the elements of anatomy and physiology was very real and served as a useful foundation for the more detailed instruction which they received upon being assigned to permanent organizations.

At 1.30 p. m. the lance corporals received a lecture on the customs of the service, the salute, how to recognize an officer, the proper respect enlisted must show to officers and noncommissioned officers, their duties, and their privileges.²⁴³ This instruction they likewise transmitted to their squads. At 3.30 p. m. the lance corporals received instruction in giving commands at drill, etc.

This instruction was varied and advanced after two weeks by the substitution of first-aid instruction in the morning period and in the afternoon first aid and the care of animals were taken up at 1 p. m. in the lecture periods.²⁴³

The following is the list of calls prescribed:²⁴³

5.30 a. m.-----	Reveille.
5.50 a. m.-----	Mess.
6.20 a. m.-----	Sick call.
6.30 to 7.25 a. m.-----	Stables—police of camp.
7.30 to 8.25 a. m.-----	Drill.
8.30 to 9.25 a. m.-----	Drill.
9.30 to 10.30 a. m.-----	Drill.
10.30 to 11.30 a. m.-----	Lecture and quiz (first two weeks). First aid (second two weeks).
11.30 to 1.20 p. m.-----	Dinner.
1.20 to 2.45 p. m.-----	First aid.
2.50 to 3.40 p. m.-----	Care of horses and corrals for student officers (before daily equitation).
3.45 to 4.50 p. m.-----	Rest period.
4.50 to 5.30 p. m.-----	Stables.
5.45 p. m.-----	Retreat.
5.50 p. m.-----	Supper.

Physical instruction of the recruit was begun shortly after his arrival in camp and was carried out in a most thorough manner.²⁰⁸ An officer who was an expert physical instructor was detailed in charge of this work. A well-laid-out athletic field was provided, and each organization in camp spent at least two hours a week on this field in addition to the special exercises prescribed in their section and company drills.²⁴⁴ During the winter months a large barrack building was converted into a gymnasium, and special gymnastic instruction was conducted there throughout the winter.

In the gymnasium the work consisted of playing handball and basket ball, bag punching, boxing, calisthenics, apparatus and bar work, and resistance exercises. Special instruction in boxing was given to a number of men from the companies who had received previous training.²⁴⁵ This was given by an expert boxing instructor.²⁴⁶ As soon as they were found qualified they were required to instruct their companies during the physical instruction period. On the athletic field the exercises consisted of athletic games, running, jumping, wall scaling, bank climbing, hand grenade throwing, etc.²⁴⁶

To facilitate control, the sections were combined into groups of from 150 to 500 men each. Each morning at mess call the sections were marched to the mess halls.²⁴³ After breakfast the sick were taken to the infirmary by a lance corporal, with their names entered upon a separate sick book for each section. The sick of the various sections were further supervised by a noncommissioned officer from each group. After the sick had left for sick call and during the interval between breakfast and the first drill hour each section was carefully examined by a medical officer for the detection of any infectious diseases. During the day section leaders were required to send to the infirmary every man who stated that he was unable to drill or who appeared ill.

Fatigue was furnished by sections; that is to say, if the casual detachment was called on for 30 men for fatigue the section designated would furnish the entire number and would send them out in charge of their own lance corporals.²⁴³

Section leaders were constantly on the alert for good substantial men in their sections. These men, when recommended by the section leaders, were

assigned as assistant section leaders to some other section where the men did not know them and where they were given the opportunity to make good. If they made a favorable impression, they were given a section of their own and a further tryout. If one of these men did not make good, he was put back into the ranks of a section, care being taken to place him in neither the one he originally came from nor the one in which he served as section leader.²⁴³

The time spent in the recruit sections varied according to the demand for men and the stock on hand. It was desired, in so far as was possible, to hold a substantial number of recruits in training in the casual detachment. An arbitrary limit of 10 days was taken as the briefest time prescribed that a man should remain under observation in the detachment before being assigned to a company. No man was assigned out of the detachment who was a mental defective, insane, had criminal tendencies, or who would later become a subject for disability discharge.²⁴³

When a call came for recruits to be assigned to some organization, they were selected carefully according to their progress in general soldierly deportment and according to the special duty they would have to perform.²⁴³ The section was formed, each man's name was called from his card, and when he stepped forward a rapid survey was made of him as to his carriage, general appearance, physique, and alertness. If his previous occupation suited the particular assignment, his card was laid aside; but if neither the man nor his occupation came up to what was required, his card was placed again in the files. For example: If men were being selected for a motorized ambulance company, men were selected who had had previous training as chaffeurs, machinists, etc. If the call was for animal-drawn company, the farmer class was selected. In both instances men of robust physique were only considered. If the call was for a base hospital, a search was made for chemists, clerks, hospital orderlies, etc. After the cards were selected in this manner they were rechecked and examined to be sure that the number of lance corporals corresponding to the noncommissioned officers to which the organization was entitled were assigned, and also that the unit was furnished with an artificer and, in case of an animal-drawn company, with a blacksmith and, if possible, a farrier, should these men be available. The cards were then gone over to see if any man had a brother or cousin in the detachment, as a great effort was made to keep relatives together wherever that could be done without injury to the service.

After an organization had been formed, particularly if the period of observation had been brief, if it was found that a few unfit men had been assigned, these men were returned to the casual detachment for further study.²⁴³ Many times these men, after a stay of from a month to six weeks longer in the casual detachment, were sent out again to other companies, where they made good.

From 75 to 100 men who were selected from those who had previously received training in the handling of animals were placed together in two sections.²⁴³ These sections did little drilling and no fatigue. They took care of the quartermaster stables and the horses used by the student officers. In this detachment if a man was not satisfactory he was immediately transferred out and replaced by another. From these selections detachments for service with Cavalry regiments were formed, and they also furnished the mounted orderlies

required with every regimental detachment. Owing to the impossibility of adequately training more than 100 men at a time, the number of mounted orderlies supplied did not exceed 2 to each detachment.

There were constantly about 25 to 30 men in the detachment who could not speak, read, or write English. An effort was made to have these transferred to the line, but this was disapproved, and a separate section to provide for their proper instruction in English was formed.²⁴³ The section leader had been a college professor and all of the lance corporals had been school-teachers. Books on elementary English were bought by the camp exchange and sold to each man in the section. Instruction in English was given intensively and the men were excused from all other duties except drill.

Every department in camp was encouraged to use as many men as possible in clerical work in order to train a large number of men in Army paper work. When clerks were required in a company or detachment being formed, they were taken from the best qualified among these men.²⁴³

An observation section was established for the study of the insubordinates, the training of the awkward and unfit, and the teaching of discipline to the unruly.²⁴³ All individuals who were hard to handle, habitually committed minor offenses, or set bad examples in lack of discipline and soldierly qualities were removed from the regular recruit sections and assigned to the observation section. The men were selected for this section in two ways:²⁴³ First, the assistant instructors, at drill, observed all recruits closely and recommended for transfer to the section those men who were awkward, and especially those who showed retarded mental development. These cases were selected especially during physical drill, as that drill required an average standard of coordination. Second, the section leaders observed their men in the intervals between drills and recommended for transfer the insubordinate, surly, quarrelsome, and excessively profane men in their sections.

The section was in charge of a sergeant, first class, of long service, especially selected on account of his proficiency in handling and controlling men.²⁴³ Assigned to him as assistants were noncommissioned officers who had shown exceptional ability in the handling of recruits, who were quiet and self-reliant, and above all highly intelligent. These were all under the command of a carefully selected officer. This officer observed the progress of each individual day by day and examined them personally at frequent intervals and made a careful estimate of their mentality. If this officer considered a man mentally defective in any way, he was carefully examined by a psychiatrist, who recommended his disposition.

During their stay in this section the men received every day three hours of foot drill, one hour's physical drill, and lectures on anatomy and physiology.²⁴³ Company punishment in the nature of extra fatigue for those who needed it was carried out more rigidly and with better observation than was possible in the average company. It was rarely found necessary to try any of these men by court-martial.

After a man had demonstrated that he had overcome his awkwardness and had learned his drill or that he had learned military discipline and would not again be guilty of insubordination, he was transferred to one of the regular

sections.²⁴³ The more difficult cases were always under careful observation, particularly in reference to their mental condition. There were instances where men became good soldiers after a period of from one to two months in this section, and some apparently hopeless individuals made excellent progress.

The number constantly under observation averaged 60. It occasionally went up to 80 and sometimes fell as low as 40. The number of men going in and coming out remained fairly constant. Many men who ordinarily might have remained in a company for a year or more, giving constant trouble, were found to be insane or mentally defective.²⁴³

As an indication of the time required to bring the men up to standard the following is a table prepared for the three-month period ending September 1, 1917:²⁴³

Transferred after a period of—

One week.....	11
Two weeks.....	12
Three weeks.....	29
Four weeks.....	21
Five weeks.....	9
Six weeks.....	2
Seven weeks.....	4
Eight weeks.....	3
Nine weeks.....	2
Two have remained for more than 10 weeks.	

From this table it can be seen that the average stay was less than three weeks.

The advantages of the system were as follows: ²⁴³ (1) It provided facility for the careful study of border-line insanity cases: (2) It eliminated from the other units of the command the men who habitually committed military offenses and acted as a detriment to the instruction of the average recruit. (3) It acted as a support and relief to the untrained noncommissioned officer. (4) It afforded an opportunity for the training of men who had not had the advantages of education or who, for various reasons, were backward in their development, and saved for the service an appreciable number of men who otherwise would have been worthless.

After the men were assigned to ambulance companies, field hospital companies or other units, the primary instruction in the school of the soldier was continued until each individual was trained to such a degree that he could proceed with the more specialized instruction. This instruction will be outlined under the heading of "Special instruction for enlisted men" (p. 244).

This system of handling recruits was not changed materially when inductants from the draft were received at camp.²⁴⁶ In the latter case their physical examination preceded everything else, and no mental examination or carding of individuals was started until they had been definitely accepted into the service. The physical examination methods were similar to those used in the larger camps.

SPECIAL INSTRUCTION OF ENLISTED MEN

As it was necessary to train a large number of enlisted men of the Medical Department to be specialists, courses for the training for these men were started very early in the history of the camp and every effort was made to include in each unit formed at the camp its proper quota of well-trained specialists.

COOKS

Men who stated that their occupation was cooking, or who had previously received training in cooking, or who desired to learn to be cooks, were assigned to a school for cooks and bakers conducted in conjunction with the general messes of the camp.²⁴³ After a thorough course, those qualified as cooks were assigned to all units organized at this camp. In the early part of 1918 a complete bakery was established at the camp, and each student in this school was given a definite period of training in baking.

WARD ATTENDANTS

A course of training for ward attendants was given to all male nurses and also to a large number of other men who were well qualified for this work. By a special arrangement with the commanding officer of the base hospital, Fort Riley, these men were placed on duty in the wards of the hospital and acted as assistants to the ward masters.²⁴³ In addition to their work at the hospital they received one hour's lecture daily. The course was continued for four weeks and on its completion men who were found qualified were assigned to evacuation and base hospitals with a recommendation for the rating of ward attendant. The following is a syllabus of the instruction received in this course:²⁴³

NURSES

Assigned to wards at post hospital. Lecture at camp one hour daily.

First week:

- Admission of patient.
- Care of patient's personal property, money, and clothing.
- Sweeping and cleaning ward without raising dust.
- Temperature, pulse, respiration.
- Baths.

Second week:

- Review, especially in temperature, pulse, and respiration.
- Bed making, simple, surgical, fracture.
- Changing linen on occupied bed.
- Enemata.
- Continuous drips—soaks.

Third week:

- Lifting and handling patients.
- Fowler's position, Murphy drip.
- Use of catheter.
- Hypodermic.
- Signs of collapse, impending death, death.

Fourth week:

- Care of property—property check, drawing property, exchange of property.
- Linen—care, exchange, credit slips.
- Ward morning reports. Report of death. Chart.

SURGICAL ASSISTANTS

The same arrangement was made with the commanding officer of the base hospital, Fort Riley, for the instruction of ward attendants.²⁴³

First week: The course consisted for the first week of lectures and recitations on bacteria, pyogenic bacteria, wounds (clean and infected), asepsis, antiseptics, sterilizing, chemical antiseptics, bandaging.

After the first week they were assigned to duty in the various operating rooms of the base hospital, but were also given instruction, mostly practical.

Second week:

Preparation of aseptic dressings—sponges, wipers, pads, strip drains of all kinds, threaded needles.

Preparation of T bandages, swathes, laparotomy sheets, splints.

Care of instruments and rubber goods.

Third week:

Sterilizing, practical; reasons for different methods.

Sharpening knives and other instruments.

Fourth week:

Preparation of patient for different operations.

Care of anesthetized patient on table.

Lifting patient from table.

Arranging anesthetist's table.

Laying out instruments.

Opening sterile packages.

Throughout the course students were given opportunity to watch actual operations when practicable.

DISPENSARY ASSISTANTS

A limited number of men were given training for work as dispensary assistants, but men selected for this training were taken from those who had previous knowledge, for it was well understood that a short course could not prepare even a very intelligent man to carry out the duties of the position unless he had had previous experience.²⁴³ The course was so arranged that students were on duty at the post hospital dispensary during the morning, and had lectures and recitations on pharmacy and materia medica during the afternoon. Candidates were required to have absolute familiarity with doses of drugs and their antidotes. Morning instruction was by practical demonstration and actual work done by candidates.

First week: Compounding and dispensing simple formulæ.

Second week: Preparation of ointments and percentage formulæ.

Third week: Infusions and tinctures.

Fourth week: Suspensions; incompatibility.

SANITARY SQUADS

Men assigned to the sanitary squads organized at the camp were attached to the sanitary laboratory.²⁴⁷ They were given extensive instruction in the practical application and construction of the various forms of apparatus provided there. They were also required to conduct the fly-prevention campaign during the spring of 1918. This campaign resulted in an almost complete absence of flies during the following summer.

X-RAY TECHNICIANS

The course for X-ray technicians was conducted in conjunction with the School of Military Roentgenology and provided instruction for a limited number of specially qualified enlisted men, most of whom were from the evacuation hospitals.²⁴⁸ The course covered the following subjects: Dark-room technique; physics of the X ray; handling of apparatus, and a limited amount of anatomy. A small manual for the instruction of enlisted technicians was prepared by the instructors in this school and was printed and distributed to the students.²⁴⁹ A complete portable field X-ray outfit was provided for the practical instruction of the class.

ORTHOPEDIC ASSISTANTS

A short course to prepare enlisted men as orthopedic assistants was conducted during the winter and spring of 1918.²⁴³ This instruction was given to provide each regimental detachment with a man having practical knowledge of the common ailments of the foot and sufficient ability to treat corns, etc., and to fit shoes properly to somewhat deformed feet. The following is an outline of the course taught:²⁴³

Lecture 1 (one hour): The human foot—Its anatomy, physiology, examination, and the significance of its abnormalities; symptoms and signs; limitations of flexion; abduction and pronation; eversion, inversion, low arches; flat feet; prominent scaphoid arthritis.

Quiz and recitation, Munson.

Lecture 2 (one hour): The soldier's foot and the military shoe.

Lecture 3 (one hour): The disabilities of the soldier's foot and their treatment. Acute foot strain; treatment; purpose, application; further treatment; ordinary foot strain; flaccid feet; rigid feet; spastic feet; flat feet; treatment; osseous flat feet; affections of the anterior arch; calluses on sole over the metatarsal heads; metatarsalgia, treatment; affections of the regions of the heel involving the tendo Achillis; involving the os calcis, treatment; hallux rigidus, hammertoe, treatment; deformities of little toe.

Quiz and recitation from Munson (one hour).

Clinic (one hour).

Shoe fitting (one hour).

Shoe alterations (one hour).

Special instructions in basic orthopedics was also given to 4 per cent of the enlisted men of the entire command.²⁴³

AMBULANCE COMPANIES AND FIELD HOSPITAL COMPANIES

When ambulance and field hospital companies were organized men were assigned to them from the casual detachment, and their training then came under the supervision of the officers in charge of these sections.²⁵⁰ The training was continued along the general lines laid down for the casual detachment, and as rapidly as possible they were given special training to fit them for the duties they would be called upon to perform.

The instruction in the ambulance companies was carried out according to the following memorandum:²⁵⁰

INSTRUCTION MEMORANDUM

First week:

- 7 to 9.20 a. m.----- Drill, foot, 1 hour; litter, 1 hour.
- 9.30 to 10.20 a. m.--- Motor companies only, mechanism of automobile.
- 10.30 to 11.30 a. m.--- Anatomy and physiology (Mason, pp. 37-38).
- 1.30 to 2.20 p. m.---- First aid (Mason, pp. 89-107).
- 2.30 to 3.20 p. m.---- Messages, signals, general orders, etc.
- 3.30 to 4.20 p. m.---- Nursing (Mason, pp. 169-178 and 185-199).

Second week:

- 7 to 9.20 a. m.----- Drill, litter, 1 hour; ambulance, 1 hour.
- 9.30 to 10.20 a. m.--- Motor companies only, mechanism of automobile.
- 10.30 to 11.30 a. m.--- Bandaging.
- 1.30 to 2.20 p. m.---- First aid, (Mason, pp. 108-140).
- 2.30 to 3.20 p. m.---- Messages, signals, general orders, etc.
- 3.30 to 4.20 p. m.---- Nursing (continued as in program of first week).

Third week:

- 7 to 9.20 a. m.----- Drills, tent. During the ensuing weeks in such exercises as the commanding officer may deem necessary to promote the efficiency of his company.
- 9.30 to 10.20 a. m.--- Motor companies only, mechanism of automobile.
- 10.30 to 11.30 a. m.--- Bandaging.
- 1.30 to 2.30 p. m.---- Entire week—review work of previous two weeks from Mason.
- 2.30 to 3.20 p. m.---- Classes for specially selected privates.
- 3.30 to 4.20 p. m.---- Entire week—review work of previous two weeks from Mason.

Fourth week:

- 7 to 9.20 a. m.----- Drill as prescribed by the commanding officer.
- 9.30 to 11.30 a. m.--- Classes for specialists.
- 1.20 to 4.30 p. m.---- Instruction of company as a unit.

The instruction of the field hospital companies was similar to that carried out by the ambulance companies.²⁵⁰

NONCOMMISSIONED OFFICERS' SCHOOL

A special school for the training of noncommissioned officers was organized in a small way from the establishment of the camp, and all lance corporals who showed adaptability for this promotion were given instruction in this school in addition to their other duties.²⁴³ Whenever men detailed to this work showed that they were not suited they were immediately relieved and returned to the ranks of the detachment. The full course consisted of six weeks' instruction.

First week:

- Morning—Cooking and mess management, in camp and field; setting up field range; daily menus.
- Afternoon—Arithmetic; hospital fund papers; daily report of mess.

Second week:

- Morning—Care of medical, ordnance, and quartermaster property; property books or cards; checking property; names of medical appliances and their component parts.
- Afternoon—Medical, ordnance, and quartermaster property papers. (Returns, requisitions, invoices, receipts.)

Third week:

- Detachment papers.
- Army Regulations.

Fourth week:

- Morning—Sick and wounded.
- Afternoon—Materia medica and pharmacy

Fifth week: Minor surgery and first aid.

Sixth week:

- Elementary hygiene.
- Review.

VETERINARY SECTION

A special section for the training of Veterinary Corps enlisted men was started February 25, 1918.²⁵¹ At first the training consisted mostly of drills and marching to get the men in proper physical condition. As soon as they received their equipment the men were assigned to recruit squads until proficient, when they were put into the regular squads for further instruction. Lectures on hygiene and military discipline, including honors and ceremonies, were given recruits as soon after joining as possible. All men were given one week's work and instruction at the corrals, where they were taught the use and care of Cavalry horse equipment and stable management, including grooming, feeding, tying in, care of feet, and care of stalls.

Men with some previous experience were also assigned to the School of Hippology, Fort Riley, for a three weeks' course.²⁵¹ Later, when there were no men with some training in this work, green men were assigned to the school for instruction, but the time required to make them qualified horseshoers had to be extended to two months.²⁵² Difficulty was experienced in obtaining pistols with which to equip these men, and finally pistols were borrowed from the ambulance companies so as to give a certain amount of target practice to all enlisted men before they were ordered from the camp.²⁵²

In May a noncommissioned officers' school was started with 18 selected men under instruction.²⁵³

The training work in the veterinary section practically ceased in September, 1918, on account of shortage of veterinary recruits.²⁵⁴

Copies of schedules followed in the instruction of these men are given below:²⁵¹

Schedule of instruction for week March 24 to 30, 1918

7.30 to 8.15 a. m.	Calisthenics; everybody except stable detail.
8.20 to 10.30 a. m.	Equitation; second squad second week.
8.20 to 10.30 a. m.	Equitation (Monday, Tuesday); tent pitching (Wednesday, Thursday, Friday); squad who completes 20 hours' equitation.
8.20 to 10.30 a. m.	Foot drill; old stable squad, recruit squad.
10.30 to 11.30 a. m.	First aid; second equitation squad, first equitation squad, old stable squad, recruit squad.
1.30 to 2.45 p. m.	Gas drill (Monday, Tuesday, Wednesday, Thursday, Friday); all men in first-aid drill and every other man available.
2.45 to 3.45 p. m.	Gas lecture (Thursday and Friday only).
2.55 to 4 p. m.	Foot drill; first equitation squad, stable squad, recruit squad.
2.55 to 4 p. m.	Stable sergeant's manual (lectures and recitations); second week for second equitation squad.
2.50 to 4 p. m.	Veterinary regulations and requisitions; selected men.
8 a. m.	Inspection (Saturday).
9.30 to 10.30 a. m.	Gas exposure (Saturday); gas house.
8.20 to 10.30 a. m.	New recruits and awkward squad, foot drill.
10.30 to 11.30 a. m.	Hygiene, Articles of War, military courtesy, and salute.
1.30 to 2.15 p. m.	Calisthenics.
2.20 to 4 p. m.	Drill.
4 to 4.50 p. m.	Hike; for entire command.
7.30 a. m. to 4.25 p. m.	Stable detail; 20 men.

Schedule of special classes, May 26 to June 1, 1918

7.30 a. m. to 4.30 p. m.----	Horseshoers' school; M. S. S.; 43 new men, 14 old men.
7.30 a. m. to 4.30 p. m.----	For police and guard duty at medical officers' training school corrals; 1 sergeant, 2 corporals, 4 farriers, 66 privates, daily.
7.30 a. m. to 4.30 p. m.----	Manual of small arms; pistol target practice; all available men.
7.30 a. m. to 4.30 p. m.----	Noncommissioned officers' school; 18 specially selected men. Instruction in special foot drill, training and commanding, paper work in connection with office.

FORT RILEY, KANS.(July 1, 1918, to February 4, 1919)¹

The partial merger of the Medical Officers' Training Camp at Fort Riley with that at Fort Oglethorpe, Ga. (see p. 25), was made during the month of July, 1918.²²⁰ With the change there was a sharp curtailment in the scope of training prescribed for the Fort Riley camp.

The decision regarding the Reserve Corps instructors to be left at Fort Riley was based on the needs connected with the training of regimental detachments, ambulance companies, and field hospitals. This limitation in the extent of training was a material change from that previously effected by the camp. The new work was to be confined to the training of officers and enlisted men for service with front-line units, leaving for Camp Greenleaf the far more pretentious training for special services connected with units of the line of communications and base. The transfer of trained instructors removed from Fort Riley the majority of the Regular officers and a large number of Reserve Corps officers who had been developed into trained teachers along special lines. Certain excess property, including saddle horses and riding equipment, was sent to Camp Greenleaf, where it was greatly needed. The movement was almost entirely effected during July. There were left at Fort Riley five Regular medical officers. About 20 Reserve Corps officers remained who, by virtue of their prior service at the old camp as instructors or assistant instructors, could be utilized as instructors for the new camp.

One of the first important changes made in camp administration immediately after the establishment of the new camp was the creation of the office of camp personnel adjutant, as directed by Special Regulations 57 and 57A. Because of the necessity of the work of this office being closely associated with headquarters, it was decided to move camp headquarters into one of the large barracks formerly occupied by one of the student companies. This building gave room not only for headquarters but for the desks, files, and personnel of the office of the camp personnel adjutant. The office of the officer in charge of the casual detachment was also moved from its former location in the camp to an adjoining building. These measures added to camp efficiency by having all administrative officers, including the quartermaster and mess officer, located close to headquarters.

New medical officers for the course of instruction began to arrive during the transformation of the camp. They were assigned to barracks in company

¹ Unless otherwise indicated, the statements herein are based on History of Medical Officers' Training Camp, Fort Riley, Kans., from July 1, 1918, to its close, Feb. 4, 1919, by Lieut. Col. H. F. Pipes, M. C., Sept. 9, 1921. On file, Record Room, S. G. O., 3516 (M. O. T. C., Fort Riley, Kans.).

organizations. The size of each company was not fixed numerically, being determined by the capacity of each building. From July 15 until the signing of the armistice 1,620 reported for training, and from the time of the organization of the camp until its close more than 4,500 officers and 25,470 enlisted men reported for training. Student Companies Nos. 36 to 54, inclusive, were created; 54 student companies in all were organized at Fort Riley.

Officers who, in the opinion of the camp surgeon, were not physically fit for field service were acted upon by a board of medical officers, which rendered its report and recommendation as to whether or not the officer should be continued in the service. These reports were forwarded to the War Department. Some of these officers reported as physically unfit for field service were assigned to stations in the United States and some were discharged from the service.

One of the important functions of the camp was the organization of units for overseas service. Orders were received for the organization of hospital trains, replacement units, evacuation ambulance companies, one corps sanitary train, and one Army sanitary train. Hospital Trains Nos. 38 and 39 were organized at the camp. Replacement Units Nos. 60 and 61, under orders dated August 9 and August 15, respectively, consisting of 250 men and 1 medical officer each, were reported ready for overseas service on August 16, 1918, and left Fort Riley, Kans., for Camp Merritt, N. J., August 24, 1918. Replacement Units Nos. 47 to 53, inclusive, consisting of 250 men each, were ordered to be organized by instructions, dated August 19, 1918, which were subsequently rescinded under instructions of September 7, 1918. Evacuation Ambulance Companies Nos. 21 to 49, inclusive, consisting of 1 officer and 37 enlisted men were ordered to be organized under instructions of September 7, 1918. Evacuation Ambulance Companies Nos. 27 and 28 and 36 to 41, inclusive, were reported ready for overseas service on October 22; and Evacuation Ambulance Companies Nos. 42 to 45, inclusive, were reported as ready under date of November 7. Evacuation Ambulance Companies 82 to 101, inclusive, were ordered organized under telegraphic instructions from the Surgeon General dated October 7, 1918, but these instructions were modified later by the Surgeon General under date of November 13 to the effect that they would not be sent overseas. Replacement Units Nos. 74 to 77, inclusive, consisting of 275 enlisted men and 2 officers each, were ordered to be organized under date of September 20, 1918, which was rescinded by telegram from the Surgeon General on October 19. Corps Sanitary Train No. 1 and Army Sanitary Train No. 1 were reported ready for overseas service on November 7, 1918. On November 21, 1918, instructions were received canceling all shipments of troops because of the signing of the armistice.

The organization of these overseas units was placed in the hands of the officer in charge of the casual detachment and the commanding officer of the sanitary train. As far as possible men were assigned to the units in accordance with their vocational qualifications, as prescribed by tables of organization. In several instances it was impossible to find men trained along specific lines to make a unit complete. This was due primarily to the shortage of enlisted men that developed in the camp.

Troop shipments and all the details relative thereto were performed by an entraining officer. Immediately upon receipt of orders from The Adjutant General directing a troop shipment, the entraining officer would be notified by headquarters. He immediately interviewed a railroad administration representative at Camp Funston, and arrangements were made for placing the necessary number of coaches and baggage cars on the medical officers' training camp siding of the Union Pacific Railroad.

The camp quartermaster was a member of the Quartermaster Corps in the first Fort Riley camp. He was succeeded by a medical officer, detailed as camp quartermaster. The medical officers' training camp was under the commanding officer at Fort Riley for purposes of administration and supply only. The source of supply of all Quartermaster Corps articles was, therefore, Fort Riley. The Medical Department property was obtained from the medical supply depot at Camp Funston. Rations were procured from the quartermaster at Fort Riley or purchased in open market. Articles of uniform and camp equipment issued to the enlisted men were obtained by the camp quartermaster from Fort Riley, and in turn reissued by him to the several organizations in the camp. This service was satisfactory. The training camp maintained a motor-repair shop which rendered the necessary service for ordinary motor repairs required in the camp. Toward the close of the camp orders were received transferring all motor vehicles to the Motor Transport Corps.

The messing of the student officers and the enlisted men in the camp was under the control of the camp mess officer. Formerly this work was done by a captain of the Quartermaster Corps, and upon his transfer to Camp Greenleaf, his responsible duties devolved upon a lieutenant in the Medical Corps who had previously seen very little service along that line. This officer assumed the duties of camp mess officer in an admirable fashion and rendered very efficient service. He was responsible for the student officers' messes and the messes maintained for the majority of the enlisted men. One, two, or three messes were maintained for the student officers according to the number present. Officers were charged a dollar a day for their food. The mess was satisfactory, but it required untiring vigilance to prevent complaints. Civilian cooks and waiters were employed in these messes. A large general mess was maintained for the enlisted men, located in the vacated artillery gun sheds at Fort Riley. Several messes were conducted in various locations throughout the camp for the enlisted men of the casual detachment. Other independent messes were maintained for such permanent camp organizations as the field hospital and ambulance companies.

The Medical Department service in the camp was efficiently handled by a medical officer designated as camp surgeon, assisted by a variable number of medical officers, determined by the amount of current work. The base hospital at Fort Riley was considered as the hospital for sick of the command. All medical detachment reports relative to the sick and wounded were rendered by the base hospital. The surgeon of the camp did not supervise the sanitation of the camp, which was placed in the hands of an officer designated as camp sanitary inspector. The camp surgeon held daily sick call and made all reports on the physical examination of officers and enlisted men. All venereal cases

were handled in the camp, except cases of syphilis requiring the administration of salvarsan, which was given at the base hospital. The health of the command was very good. During the influenza epidemic of October, 1918, an extemporized camp hospital was organized for the receipt of all influenza patients. From this camp hospital cases were promptly transferred to the base hospital when they presented severe symptoms. No Medical Department records were kept in the camp of cases requiring slight treatment. There was a small camp hospital, regularly established in connection with the camp infirmary, to which one or more medical officers were assigned for the purpose of treating minor cases of the sick of the command. No permanent Medical Department records were kept of this group of cases.

The camp exchange was centrally located in the training camp, but during the periods when the enlisted strength of the command varied between three and four thousand men one small subsidiary exchange was established. During the summer of 1918 the receipts of the exchange were heavy. A small improvised bakery was established, first by the mess officer, but subsequently it was taken over by the camp exchange in order to avoid the accumulation of unauthorized funds in the hands of that officer. Cakes, pies, and pastry, together with ice cream, were made by the bakery and considerable profit accrued from its operation. The exchange fulfilled a useful need in the camp, particularly in meeting the requirements of the enlisted men. Sales were much cheaper than those prevailing in the adjoining towns of Manhattan and Junction City, and yet the margin of profit was such as to permit of liberal dividends to those organizations participating in it. Upon the closure of the camp in February, 1919, the camp exchange officer, in pursuance of general instruction from The Adjutant General, transmitted to the War Department over \$40,000, which was obtained from cash on hand and money accruing from the sale of stock and fixtures.

The quarters occupied by officers and enlisted men were wooden cantonment buildings of the one-story type, of a capacity varying from 80 to 100 men. They were heated by coal stoves, from two to four stoves in each building. On account of the wooden construction of these barracks, although lined with beaver board, during the severe winters of 1917-18 and 1918-19 there was some discomfort from the cold. Lavatories were in the rear and detached from each barrack, one, as a rule, being provided for each building. There were not adequate quarters for the enlisted men at the medical officers' training camp at Fort Riley until the latter part of the summer of 1918, when the alteration and remodeling of 18 Cavalry stables had been completed in the casual area of the training camp. Lumber and other material were available for these alterations, and the labor was supplied by the enlisted men of the camp. From the Cavalry stable sheds fairly comfortable barracks were obtained by walling and flooring them. Adequate doors and windows were provided, together with stoves and iron bunks. Thus modified, the barracks were capable of holding from 80 to 120 enlisted men each, allowing each man the proper amount of floor space. In these areas there was some discomfort on account of the lack of lavatories. In some cases it was necessary to establish pit latrines, and constant vigilance was required to keep them in proper condition. It was

planned to construct camp lavatories connected with the water system of the camp in the area of these modified barracks, but this was not done because of the cessation of camp activities shortly after the signing of the armistice. During the fall of 1918, realizing that a large lecture hall must be provided for the officers' school during the winter, an auditorium with a seating capacity of 800 was erected by the enlisted men of the command. It met a great need of the camp, was centrally located, and was used as a lecture hall and a place for theatrical amusements for the benefit of the entire command.

GENERAL INSTRUCTION FOR OFFICERS

In the old order of things among the medical officers' training camps it had been ascertained that no more than 40 per cent of the Medical Reserve Corps officers called into active service during the war were sent to one of the several Medical Department training camps. The Surgeon General held that a shorter course of instruction would permit more medical officers to receive a course of medico-military instruction prior to their assignment to duty either in the United States or overseas. The officer then in charge of the training camp division of the Surgeon General's Office expressed the opinion that one month should prove adequate for this training, provided it was limited to only a few major subjects, with an entire elimination of all strictly professional instruction. With this idea in view, the following orders covering a course of instruction were issued:

General Order No. 37.

HEADQUARTERS MEDICAL OFFICERS' TRAINING CAMP, *Fort Riley, Kans., July 16, 1918.*

1. A course of instruction will be given to officers assigned to this camp for duty for preliminary instruction prior to their permanent assignment to units or other detail. As a rule the officers to take this instruction will be those recently called to active service from civil life or those officers previously called who have not had the benefit of training camp work.

The following subjects will be taken up and the hours allotted to them as follows:

	Hours
Customs of the service and duties of the soldier.....	1
Demonstration of personal equipment, sanitary soldier, and field and surplus kits.....	1
Tent pitching, shelter half (1 hour); tent pitching pyramidal tent (2 hours).....	3
Tent pitching, hospital tentage.....	2
Regimental detachment, its equipment, use, and internal administration.....	4
Demonstration of regimental combat equipment.....	2
First aid, using soldiers' equipment only.....	1
Army Regulations, general orders, bulletins, special regulations, War Department, essential elements of.....	15
Manual of the Medical Department, essential elements of.....	15
Paper work, Medical Department, Quartermaster Department, Ordnance Department..	15
Demonstration of field sanitary appliances (2 hours); sanitary inspections (2 hours)...	4
Ambulance companies, equipment, use, and internal administration.....	4
Field hospitals, use, and internal administration.....	4
Manual for Courts-Martial and Military Law.....	3
Poison gases and liquid fire (2 hours); gas mask drill (2 hours).....	4
Demonstration of trench system.....	2
Equitation, including care of animals, saddling, etc. (each Saturday afternoon).....	4

2. The senior instructors in Army Regulations, Manual for the Medical Department, paper work (Medical Department), and officers in charge of drills, at the end of their subject will hold an examination and submit their marks on the student officers' work. Instructors in the other subjects will not submit marks but will make report to the commanding officer if any student officer's work is not satisfactory.

3. The director ambulance companies, director field hospitals, and officer in charge regimental detachments (now casals) will submit marks on the general efficiency and adaptability demonstrated by the student officers assigned to them for temporary duty in their departments, respectively.

4. This school of instruction will be held for all student officers, whether assigned to ambulance companies, field hospital companies, or regimental detachments, and if practicable only one class will be held for the entire course. All student companies take the several classes and subjects at the same time, irrespective as to when they are organized.

5. The schedule of instruction consists of four weeks, called first, second, third, and fourth week course. By keeping a record at headquarters of the course of instruction and day of that week in which the officer began his course he will receive his entire course, provided he remains at the school for four weeks.

By direction of Lieutenant Colonel Pipes:

J. N. SHERMAN,

Captain, M. R. C., Assistant Adjutant.

General Order No. 38.

HEADQUARTERS MEDICAL OFFICERS' TRAINING CAMP,
Fort Riley, Kans., July 16, 1918.

1. In addition to their other duties, the following officers are detailed as instructors in connection with the School of Instruction, medical officers' training camp, as follows:

SENIOR INSTRUCTOR	SUBJECT
Captain Abraham.....	Customs of the service and duties of the soldier. Demonstration of personal equipment, sanitary soldiers, and field and surplus kits. Tent pitching, shelter half tent pitching, pyramidal tent pitching, hospital tentage.
Major Clark.....	Regimental detachment, its equipment, use, and internal administration. Demonstration, regimental combat equipment.
Lieutenant Baird.....	First aid, using soldier's equipment only.
Major Kinard.....	Army Regulations, general orders, bulletins, special regulations of War Department.
Lieut. Carl Davis.....	Essential elements of Manual for the Medical Department.
Major Morrill.....	Essential elements of paper work, medical quartermaster, Ordnance Department.
Lieutenant Bayer.....	Demonstration, field sanitary appliances, sanitary inspectors.
Lieutenant Colonel Cook..	Ambulance company, its equipment, use, and internal administration.
Major Wetherbee.....	Field hospital, its equipment, use, and internal administration.
Major Peters.....	Manual for Courts-Martial and Military Law.
Lieutenant Halley.....	Poison gases and liquid fire and gas-mask drill.
Captain Pickard.....	Demonstration of trench system.
Lieutenant Hennessey.....	Physical drill and sanitary drill.
Lieutenant Baird.....	Equitation, including care of animals, saddling, etc.

By direction of Lieutenant Colonel Pipes:

J. N. SHERMAN,

Captain, M. R. C., Assistant Adjutant.

Copies of these orders were sent to the Surgeon General, who decided that the new course of instruction should be extended from the period of one month to that of six weeks. This was accomplished by the following order:

General Order No. 39.

HEADQUARTERS MEDICAL OFFICERS' TRAINING CAMP,
Fort Riley, Kans. August 19, 1918.

1. Beginning September 1, 1918, the official course of instruction at this camp for student officers will extend over a period of six weeks.

2. A similar course of instruction for a like period will be begun on the 1st day of each succeeding month for such officers as shall have reported for same.

3. The officers who remain after the completion of their course of six weeks will continue to receive instruction until permanent assignment is made for them. This instruction will begin the 15th day of each month and will be for the most part practical and will be given under the supervision of the directors of field hospital companies and of ambulance companies. Future orders from headquarters will govern assignment of such officers as remain for this instruction.

4. In addition to their other duties the following officers will give a course of instruction in the subjects as herein specified in the School for Medical Officers to begin September 1, 1918:

	Hours
Army Regulations, essentials of (Maj. K. W. Kinard, M. C.)	18
Demonstration of field sanitary appliances (Capt. A. G. Byers, M. C.)	2
Demonstration of field combat equipment (Lieut. R. A. Hennessey, M. C.)	2
Demonstration of trench system (Lieut. R. A. Hennessey, M. C.)	2
Duties of personnel adjutant (Capt. W. L. Nelson, M. C.)	2
Examination of recruits with papers and finger prints (Maj. A. M. Farrell, M. C.)	8
Field Service Regulations, essentials of (Lieut. Carl Davis, M. C.)	5
Field and surplus kits; care and maintenance of soldier's equipment (Capt. E. H. Morgan, M. C.)	1
General organization of Medical Department for war (Lieut. Carl Davis, M. C.)	1
Handling of rations and mess management (Lieut. H. I. Conn, M. C.)	2
Manual for the Medical Department, essentials of (Maj. F. H. Dammasch, M. C.)	18
Manual for Courts-Martial and Military Law, essentials of (Maj. J. D. Peters, M. C.)	5
Map reading, use of compass, orientation, road sketching, etc. (Capt. F. E. Ellison, M. C.)	7
Military hygiene and sanitation, essentials of (Maj. H. C. Parker, M. C.)	9
British Medical Service at the front (Maj. W. B. McDermott, C. A. M. C.)	5
Paper work relating to Ordnance Department, essentials of (Maj. F. H. Dammasch, M. C.)	2
Paper work relating to Quartermaster Department, essentials of (Maj. F. H. Dammasch, M. C.)	4
Paper work relating to the Medical Department, essentials of (Maj. F. H. Dammasch, M. C.)	12
Poison gases, protection against, symptoms and treatment (demonstration); liquid fire (Capt. G. D. Halley, M. C.)	2
Practical demonstration of saddling, bridling, and grooming; care of leather (Capt. Robert J. Coffeen, V. C.)	4
Tent pitching, hospital tentage (Capt. H. C. Parsons, M. C.)	2
Tent pitching, shelter tent (Capt. H. C. Parsons, M. C.)	2
Tent pitching, pyramidal and wall tent (Capt. H. C. Parsons, M. C.)	2
Tent pitching, ward tent (Capt. H. C. Parsons, M. C.)	2
The ambulance company, its equipment, use, and internal administration (Capt. V. R. Abraham, M. C.)	6
The field hospital, its equipment, use, and internal administration (Maj. J. R. Wetherbee, M. C.)	7
The Medical Department in campaign and sanitary tactics (Maj. H. C. Parker, M. C.)	5
The regimental detachment, its use and internal administration (Lieut. R. A. Hennessey, M. C.)	4
The service and mechanism of supply in the field (Lieut. Donald J. Enfield, M. C.)	1
Tactical use of Infantry, Cavalry, and Field Artillery (Capt. E. H. Morgan, M. C.)	1

	Hours
Gas-mask drill (Capt. G. D. Halley, M. C.)	2
Equitation and hikes (hikes, Capt. A. E. Westervelt, M. C.; equitation, Lieut. B. A. Baird, M. C.)	38
Practical demonstration, medical service, zone of the advance, including regimental detachment and sanitary train, complete	12
Total hours for course	195

Because of the shortage of instructors, it was realized from the beginning that the only possible system of instruction that could be adopted was a rotary course, in which all of the student officers were in one large class. Immediately upon reporting to the camp, the new medical officer was assigned to this class where he took up the course of instruction then going on. As the class work was continuous and repeated, at the end of one month, and later six weeks, each officer covered the entire course of instruction. This method was not as efficient as that of the former system of instruction followed at Fort Riley, where instruction was given by companies, and, therefore, in comparatively small classes, which permitted not only lectures but recitations. When the course was of one month's duration, four schedules of instruction were issued one for each week as follows:

Schedule for the first week's instruction

1. Reveille. Hours designated by camp orders as to roll calls.
2. Setting-up exercises for 20 minutes, beginning immediately after reveille roll call. Daily except Sunday and holidays.
3. Breakfast, followed by police of barracks, etc.
4. 7 to 8 a. m. sanitary drill, daily except Friday, Sunday, and holidays; 7 to 8, camp gymnasium, Friday.
5. 8.15, Saturday, student company inspection by officer in charge of student companies.
6. 8.15 to 11.30, daily except Sunday, student officers will be reported to organizations to which they have been temporarily assigned to duty, namely, duty with ambulance company, field hospital, and regimental detachment (casuals at present). On Saturday student officers report immediately after Saturday morning inspection.
7. School for medical officers.

During the summer of 1918, on account of the heat, class instruction was given out of doors in one of the numerous natural amphitheaters created by deep, shady gullies in the camp. Later, when the weather grew cooler, class instruction was given in the large auditorium, close to headquarters. Supplementary to the theoretical course heretofore described, a practical course of instruction was given by the commanding officer of the Second Sanitary Train, to which organization student officers were assigned prior to their transfer from camp. This could not always be done because of the numerous orders received transferring medical officers away from the camp. In the sanitary train an intensive practical course of instruction was given in ambulance company and field hospital work. The ambulance companies and field hospitals of the Second Sanitary Train at Fort Riley were motorized.

It had formerly been the custom of the commanding officer to recommend to the Surgeon General the assignment of student medical officers. Orders were then requested from The Adjutant General of the Army and transfers effected, usually as recommended. After the establishment of the new camp,

this method was not followed out, and all orders were received direct from The Adjutant General ordering the transfer of medical officers by number and not by name. No information was given as to the character of the service required, other than that inferred from the place covered by the particular order. Each officer was interviewed by the commanding officer of the camp and an estimate made upon his fitness for service based upon his character, appearance, address, military bearing, and reported efficiency in class work. The officers were then sent to their designated places by camp orders, and telegrams were sent to The Adjutant General and the Surgeon General giving the name of each officer transferred and place to which transferred.

GENERAL COURSE OF INSTRUCTION FOR ENLISTED MEN

The source of enlisted personnel of the camp was mainly by draft from Kansas and States contiguous thereto. Toward the latter period of the life of the camp, orders were received for the transfer of 3,000 men from Camp Funston, Kans., for the organization of units for overseas service, but only a small portion of these men were transferred to Fort Riley.

Instruction of the enlisted men was placed in the hands of the officer in charge of the casual detachment. The work taken up was the school of the soldier, marching, tent pitching, individual cooking, and other training for field service. Full field equipment of the enlisted men of the Medical Department was not available at Fort Riley for issue to all enlisted men. This was due to the scarcity of equipment in the United States and its conservation for issue to troops upon arrival overseas. This shortage of essential articles of individual equipment was an impediment to the thorough instruction of troops.

Noncommissioned officers were appointed to all grades by the commanding officer in accordance with existing orders. On August 24, 1918, a school of instruction for noncommissioned officers, with a view to their training for commissions in the Sanitary Corps, was established. This course of instruction was covered by the following order:

General Order No. 41.

HEADQUARTERS MEDICAL OFFICERS' TRAINING CAMP, *Fort Riley, Kans., August 24, 1918.*

1. A school for noncommissioned officers, with a view of their training for commissions in the Sanitary Corps for special service with sanitary detachments, will be established at the camp and will commence Tuesday, August 27, 1918.

2. Old headquarters building is assigned as the assembly hall for this school.

3. The following officers and nonecommissioned officers, in addition to their other duties, are assigned as instructors in the subjects indicated after their names, together with the time allotted to each subject.

4. Maj. K. W. Kinard, M. C., in addition to his other duties, is detailed as officer in charge of this school.

Name	Subject	Hours
Capt. Carl H. Davis, M. C.	Army Regulations	9
Capt. A. G. Byers, M. C.	Clarification and purification of drinking water	1
	Cremation and disposal of animal remains	1
	Demonstration of field sanitary appliances	3
	Hygiene and sanitation, essentials of	12
Capt. F. E. Ellison, M. C.	Inspection of garbage dumps, Fort Riley and Pawnee	4
	Drafting room, sanitary appliances	27
	Map reading, use of compass, orientation, etc.	3
	Road sketching	3
Maj. H. C. Parker, M. C.	Field Service Regulations, essentials of	3
Capt. H. C. Parsons, M. C.	Service zone of advance	2
Lieut. J. W. Sellards, M. C.	Medical supplies, methods of obtaining same	1
Maj. J. D. Peters, M. C.	Manual for Courts-Martial, essentials of	4
Capt. G. D. Halley, M. C.	Poison gases and liquid fire	2
Capt. W. F. Speers, M. C.	Inspection of barracks	4
	Inspection of water carts	3
Lieut. W. S. Holmquist, M. C.	Inspection of storehouses	3
Lieut. J. L. Wooden, M. C.	Inspection of latrines	3
Lieut. E. L. Zimmerman, M. C.	Inspection of kitchens	4
Lieut. H. J. Barker, M. C.	Inspection of stables	4
Capt. E. A. Baker, M. C.	Camp inspection, with report	10
M. H. Sergt. E. Stevenson, M. D.	Paper work, Ordnance Department	2
	Paper work, Quartermaster Department	4
M. H. Sergt. Hugo Winkler, M. D.	Paper work, Medical Department	12
Sergt. (First Class) E. F. Crabb, M. D.	Manual for the Medical Department, essentials of	10
	Poisons, chemical tests for	1
	Poisons and antidotes	2

By order of Lieutenant Colonel Pipes:

J. D. ENFIELD,

First Lieutenant, M. C., Assistant Adjutant.

Thirty-eight noncommissioned officers and two privates took this course, Athletics and physical training of the enlisted men were placed in charge of one officer who had had considerable experience in such work. Baseball, football, and basket ball were taken up.

A letter was received from the Surgeon General under date of November 21, 1918, stating that orders had been issued by The Adjutant General of the Army that all shipping schedules designating troops for early service overseas had been revoked. Meanwhile orders were received directing the discharge of emergency officers and enlisted men. All such officers were examined physically prior to their discharge and sent to their homes. Orders were then received to transfer all property to Fort Riley, Kans., excepting Medical Department property, which was turned over to the medical supply depot at Camp Funston. During December, 1918, and January, 1919, there was a progressive reduction of the strength of the command. All enlisted men regularly enlisted in the Army and not eligible for discharge were transferred to places designated by The Adjutant General. Orders were requested for the Regular medical officers, and finally on February 4, 1919, the medical officers' training camp was formally closed. Prior to its final abandonment the entire camp was thoroughly policed, and after rigid inspection of all buildings and grounds the camp was turned over to the commanding officer, Fort Riley.

FORT BENJAMIN HARRISON, IND.^m

ORGANIZATION

The medical officer who had been detailed to act as commanding officer of the training camp²⁵⁵ arrived on May 23, 1917. The buildings, which had been ordered to be ready for occupancy on June 1, by 600 student officers,¹ were only partially completed, and the equipment was meager. The camp opened, however, on June 1, with 118 student officers, 9 Regular officers (who had been ordered to report as instructors), 150 recruits, and 1 female clerk.

SANITATION

The sanitation of the medical camp was at all times as good as general conditions would permit; the sanitation of the military reservation as a whole was unsatisfactory for some weeks. To a certain extent this was inevitable, as the rapid change of the place from a garrisoned post to a great camp of recruits entailed the presence not only of recruits, but also of thousands of civilian laborers and hundreds of hired teams of horses, with the result that soil pollution got far ahead of conservancy measures, and fly breeding was extensive. Up to August 10 these conditions were not within the control of the medical officers' training camp, but on that date the commander of Fort Benjamin Harrison issued an order placing sanitary control of the reservation in the hands of the commandant of the camp, and providing means for making the control effective. Thereafter the faulty conditions were rapidly corrected and the process of correction constituted valuable instruction in sanitation.

INSTRUCTION

OFFICERS

The course of instruction followed the outline prescribed by the War Department,²⁵⁶ which had been arranged to cover schedules of 10 hours' work per day for 13 weeks. Schedules for June, July, and August were prepared accordingly.

The plan was to divide the student officers into companies, each to be commanded and instructed, in accordance with the schedule, by an officer of the Regular service. Each of the Regular officers had assigned to him in addition a subject or subjects in which he was to act as specialist and supervisor of instruction in all companies; for example, one officer was to plan and supervise all instruction relating to courts-martial, another that of equitation, another that of field hospital work. This plan was very good fundamentally, but many obstacles arose to interfere with its execution, notably among them being the following: (a) The irregular arrival of new men, which necessitated the placing of some in classes which had gone over from a few days to some weeks of instruction; or, as an alternative, starting new classes with inexperienced reserve officers in charge. The former procedure was the more satisfactory for a while, but the increase in numbers and the progress of the course necessitated change to the latter; (b) frequent calls to send officers away from the camp for foreign

^m Unless otherwise indicated, the statements herein are based on: History of Medical Officers' Training Camp, Fort Benjamin Harrison, Ind., by Col. P. M. Ashburn, M. C., Nov. 30, 1917. On file, record room, Surgeon General's Office 354.6 (Fort Benjamin Harrison, M. O. T. C. (C)).

service or duty in other places; (c) frequent calls to give numbers of officers training for special work, to be taken up at early dates; (d) organization of units which demanded the whole time of officers assigned to them.

The broad outlines as given in the course of instruction prescribed by the War Department²⁵⁶ were followed as closely as possible. Every effort was made to have the instruction given by, or under the direct personal supervision of, Regular medical officers, to which end a Regular officer was assigned over as small a group of student officers as the supply of Regulars allowed. In general, each instructor had under him from 100 to 150 student officers. He could keep in touch with that number, learn their names, faces, and capacities, adapt instruction to individual needs, and answer the numerous questions which could be answered out of extensive experience, rather than out of books.

All student officers, despite their rank, on arrival were required to remove their insignia and to assume the rôle of cadets for a time under a company commander and two assistants. Each Regular officer instructor had reserve officers as assistants, who, in time, came to be valuable teachers. It was not to be expected, however, that they would be able to take the place of Regular officers. It was the unanimous opinion at the camp that the personal influence and teaching of the Regular officers was the most important part of the instruction scheme.

The lectures and quizzes were given in the company mess halls, except in very hot weather, when they were given in shaded groves in the camp. In addition to the routine class instruction, each Regular officer had assigned to him some subject or subjects which he was to prepare for or give to the entire camp, either in mass assemblage or by companies or sections. He was responsible for this instruction, whether he gave it in person or through assistants. These individual officers were responsible for instruction in map reading, road sketching, and field problems; hospital work and tent pitching; ambulance company work; regimental detachment work; equitation; and so on through the list. At first, they gave this instruction in person, and some of it was so given throughout the entire period; however, as assistants became sufficiently trained, their services were utilized for this purpose, under the supervision of the responsible officers. Later, certain reserve officers with special training in certain subjects assumed full charge of instruction in these subjects. For example, one officer taught the care of wounds in battle-front hospitals, another gas defense, and another examination for pulmonary tuberculosis, and as stated before, many reserve officers gave valuable lectures on special subjects.

By the beginning of July it was apparent that newly arriving officers were at a disadvantage if placed in companies which had already received a month of the course of instruction; the number of arrivals was also increasing so rapidly as to show the necessity for forming new companies. No additional Regular officers were obtainable as instructors, and it was intimated that some of those at the camp might be ordered away. So it was determined to put two understudies at work with each Regular, at the same time realizing the impossibility of developing them into capable instructors in all the duties of the Medical Department in a few months. It was pointed out to the Surgeon General that it was much easier to develop men into capable field officers and

send them out to the front in place of Regulars than to have them take the place of Regulars in a camp of instruction. Attention of the Surgeon General again later was called to the impracticability of using reserve officers as instructors, but it was not possible to furnish any more Regular officers, as the need for services elsewhere was too great.

As previously noted, one of the disadvantages of the plan of instruction was that it extended over a period sufficiently long to entail the calling away of men before the completion of the course. On such occasion, the question of the advisability of shortening the course arose. In view of the fact that more than half of the medical officers ordered to duty with troops went directly from their homes to that duty without any preliminary training, it appeared that it would have been preferable to plan for an intensive course of adaptation for all extending over a period of six weeks rather than the present plan of giving a minority of men a course lasting twice as long. No change in this direction was made, however, during the first three months' course. Later it became necessary to extend the use of reserve officers as teachers. This resulted in a lessening of interest on the part of the student officers and in a lowering of the efficiency of the work.

On July 30 the commandant received word from the Surgeon General that on August 24 personnel to form training cadres for the sanitary trains of the National Army would have to be sent out.

This made it necessary to bring about an almost complete rearrangement and reorganization of the units then in camp. The 4 field hospitals and 4 ambulance companies had to be split into 6, regimental detachments had to be split and rearranged, student officers had to be reassigned, and other changes made. It was apparent that at least 6 field hospitals and 6 ambulance companies would have to be made, 5 to be sent out and a skeleton one to be kept to look after the equipment of the departing companies. These contemplated withdrawals, and resulting changes again seriously interfered with the regular schedule, as it became necessary to concentrate upon the training and instruction of the new units of sanitary trains which were to go away. The plan then outlined and subsequently carried out in larger part was that one hospital company and one ambulance company should be sent to each of five National Army camps, where each was to expand into and form the training cadre of a battalion, the hospital company thus developing into a hospital battalion, the ambulance company into an ambulance battalion.

ENLISTED MEN

The instruction of the enlisted men was carried on intensively from the beginning, mainly under four experienced Regular officers. Noncommissioned officers were developed in fair numbers and the field work of the detachments and units was brought to and kept in a good state of efficiency. All enlisted men not belonging to the units formed were organized into and trained as regimental sanitary detachments.

SUMMARY

Supplies and men continued to come in until the end of September, but by that time it was definitely known that the camp was to close by the 1st of December (1917), and thereafter efforts were concentrated on giving as much training as possible to men who had arrived. This was mainly training in field work and administration, although some effort was also made to give instruction in special medical subjects, such as diagnosis of cardiovascular conditions and tuberculosis, Roentgenology, and orthopedies. Special classes were also trained for work as adjutants, registrars, and in other administrative positions.

The training in medical specialties was never carried to the extent in this camp to which it was later carried at Camp Greenleaf; it was not believed by the commandant that a training camp such as those established in 1917, operated under the conditions there obtaining, was a satisfactory place in which to give such training. Nevertheless good was accomplished by standardizing methods and technique and increasing the general effectiveness of the average of men doing special work.

The strength of the camp at 15-day intervals was as follows:

	Officers	Enlisted men		Officers	Enlisted men
June 1.....	12	150	Aug. 31.....	1,188	1,444
June 15.....	318	680	Sept. 15.....	1,148	1,589
June 30.....	494	1,491	Sept. 30.....	1,267	2,083
July 15.....	525	2,182	Oct. 15.....	1,207	2,083
July 31.....	578	2,495	Oct. 30.....	992	2,061
Aug. 15.....	1,089	2,703	Nov. 15.....	718	1,765

Altogether 2,141 officers and 4,211 enlisted men passed through the camp.

The units organized were 4 field hospitals, 4 ambulance companies, and 1 evacuation hospital. The field hospitals and ambulance companies were twice formed, as almost their entire personnel was ordered away in August to form units elsewhere. In addition to the units organized here, 1 field hospital and 1 ambulance company of the Indiana National Guard and 1 base hospital unit were sent to the camp for training.

The camp was closed on December 2, 1917.

FORT DES MOINES, IOWA *

(For Colored Officers and Enlisted Men)

ORGANIZATION AND ADMINISTRATION

The training camp for colored medical reserve officers and enlisted men of the Medical Department was organized July 26, 1917, at Fort Des Moines, Iowa. The course of instruction is outlined in the following letter:²⁵⁷

1. A training camp for colored medical officers has been authorized established at Fort Des Moines, Iowa, under first indorsement (354.1). The Adjutant General's Office,

* Unless otherwise indicated, the facts stated herein are based on: Report of Activities, Medical Officers' Training Camp, Fort Des Moines, Iowa, July 26 to Nov. 13, 1917. By Lieut. Col. E. G. Bingham, M. C., commandant. On file, Record Room, S. G. O., 354.6 (Fort Des Moines, Iowa, M. O. T. C.).

dated July 10, 1917. The capacity of this camp is 50 student officers, colored, and 10 regimental sanitary detachments, colored, for use in training colored medical officers and to meet the needs of colored troops as these are later organized.

2. This training camp will be under the immediate jurisdiction of the local commander for purposes of administration and supply. It is under the Surgeon General in respect to all matters relating to the work of instruction. For the latter purpose, the surgeon, Fort Des Moines, will direct and be responsible for all matters of instruction.

3. These instructions are intended to coordinate the work at the various medical camps of instruction so that it will be carried out on common lines.

Also so that the instruction given at these camps, and that which it is proposed to give the medical personnel necessarily serving with troops to meet their needs in the field and at posts, shall have similar basis and method.

To the end that the instruction to be given and the results to be secured shall be standardized, the general provisions of this letter will be strictly carried out. All details of execution are left to you, and you are held responsible for proper results.

4. The course at the medical officers' training camps is intended to give the student officers a general idea of the basic duties of a medical officer and prepare them for service with troops in the field. Training will be intensive and pushed as rapidly as possible.

5. The training to be given is intended to prepare these officers to conduct the service of the Medical Department without either the supervision of experienced medical officers or the aid of well-qualified noncommissioned officers. The limited number of these two classes in the Medical Department, and the necessity of assigning many of them to important administrative duties, renders it possible that few, if any, will be available for regimental duty.

For this reason, also, upon the reserve medical officers graduated from these training camps will fall the duty of themselves drilling and training the thousands of enlisted raw recruits which will be assigned to the Medical Department, and they must be put into a condition to carry out effectively this most important work.

6. Your camp will have accommodations for 50 student medical officers. They will be organized into a company, duly officered and noncommissioned officered from among themselves, and trained on a basis of medical cadets. It is desired to impress upon these new officers, by actual experience, what will later be required by them of their subordinates.

7. Your staff will be composed of all Regular medical officers at your post, who will be instructors in addition to their other duties. Due to the shortage of Regular officers, specially qualified militia or reserve medical officers may be assigned to such duty. Officers with regimental detachments will, in addition to their duties as such, serve as instructors.

You will make such assignments to instruction duty as you deem best, making due effort to assign to each subject officers known to you to have given special attention thereto and to possess ability to impart information.

You are authorized to use as instructors any student officers found specially qualified in any subject, and to give them special authority while so serving, irrespective of rank.

Your staff of instructors will, if desired, give the necessary instruction in hygiene and first aid to the line-officer candidates of the adjacent training camp. Conversely, you should ask the assistance of the line-officer instructors at line camps in teaching map reading, in special lectures, and in the tactical part of medicomilitary problems and maneuvers.

8. Instruction by lectures, except in special subjects, will, as far as possible, give place to recitations. Lectures are not considered as effective as recitations in imparting detailed information, nor do they afford opportunity to test the capacity and grade the student.

Lessons will, therefore, be assigned in the authorized textbooks, and quizzes held thereon, for the purpose of grounding them in theory and insuring that a competent knowledge of methods and principles has been acquired.

9. But coincident with the theoretical instruction, the student officers should as far as possible be made to visualize the organizations, apparatus, and methods concerned. In addition to study and lectures, it is most important that they should learn by seeing and doing. So far as possible, instruction will be made practical.

To this end, for example, specimens of all sanitary appliances and methods likely to be of use in field work will be procured or constructed, and continually kept in effective operation at the camp, and the officers will be shown their purpose and practical use.

Bombproofs for trench warfare and gas chambers for practical trial of protection against poison gases will be constructed.

In connection with paper work, all papers required by the medical and other departments will be actually made out until familiarity therewith and correctness of result is secured.

Mess management, taught in theory, will be actually demonstrated in the organization kitchens. Applied camp sanitation will be taught by sanitary inspections. Drill will be taught until every officer can himself effectively handle and instruct therein the units and detachments of the Medical Department.

The internal economy and administration of regimental detachments will be taught not only by books but by assignment to such organizations and quartering and subsistence therewith, and by actually handling them in marches and comprehensive field problems. To permit of the latter it is expected that 10 regimental sanitary detachments, all complete and kept recruited up to war strength, will be organized at your camp without delay. The regimental detachments will be organized as three provisional companies, to be split into their integral regimental parts for demonstration purposes.

10. You will assign student officers to duty with regimental detachments, as their officers and as supernumeraries, to familiarize them with these organizations, the handling of men, etc. Officers so assigned should be quartered and messed with these organizations, but will pursue the regular curriculum of training at the camp. Assignments as supernumeraries should be made in rotation, and ordinarily for 30 days with each organization.

11. The training course will be divided into three periods, of one month each. The first, while instructing the officer as such, is intended especially to familiarize him with the duties of his enlisted subordinates whom he must shortly train. The second takes up his training in his own special functions as an officer. The third carries on and completes the work of the second period.

New training classes should as far as possible be started at the conclusion of each month's training period. However, to meet immediate needs, officers needing training will be sent to camps at any time and will be organized at once into groups for instruction.

12. The following textbooks are authorized for the course of instruction: Army Regulations, Manual for the Medical Department, Field Service Regulations, Drill Regulations for Sanitary Troops, Manual for Courts-Martial.

These books will be invoiced to you without requisition. You will issue one copy of each to each student officer, who will take them with him when he leaves camp for duty elsewhere for reference and use in training his subordinates.

Maps and war-game sets will be sent without requisition.

You will procure maps of the maneuver grounds in the vicinity of your camp from the commanding general of your department. One map should be available to each student officer.

13. The following school textbooks will be sent you without requisition. They are for use in your training work and will not be taken away by officers.

Field Physical Training of Soldier, Koshler.

Special Regulations No. 23.

Manual of Physical Training, Koshler.

Technical Military Dictionary (English-French and French-English), Willcox.

Manual for Noncommissioned Officers and Privates of Infantry, 1917.

Handbook for Sanitary Troops, Mason.

Medical Service in Campaign, Straub.

Elements of Military Hygiene, Ashburn.

Principles of Sanitary Tactics, Munson.

Military Hygiene, Havard.

Sanitation in War, Lelean.

Gunshot Injuries, LaGarde.

Military Surgery, Penhallow.

Surgery in War, Hull.

Also Merton's life-size first-aid charts.

In addition, a miscellaneous assortment of reprints, bulletins, etc., will be sent you for reference and distribution. Also a series of current medical publications.

14. The daily instruction, except Saturday afternoon and Sunday, should approximate seven and one-half hours.

It is left to the commandant of each medical officers' training camp to prepare schedules for the hours available in each period of instruction among the subjects and time therefor required. This will enable the meeting of the needs of emergency, stormy weather, etc. Copies of the detailed schedules so prepared by you will be furnished this office as soon as practicable.

15. The following general scheme is suggested for the daily schedule for the first month:

* * * * * *

16. On this general plan, 180 hours of formal instruction will be given monthly. While the colored medical officers will be assigned to regiments, they should of course be instructed in the work of the Medical Department as a whole. No evening exercises are contemplated. Time will be needed for study. Saturday afternoon should be a rest period. Officers should be encouraged in equitation on Sunday, preferably in form of tactical ride. The schedule provided for a total course of 580 hours of instruction.

17. The following scheme shows the proposed scope and distribution of training of medical officers during the first period of one month of 30 days:^b

* * * * * *

18. Dental surgeons will be required to take the general course for medical officers, with the exception of the subjects which pertain more or less exclusively to the work of medical officers as such, and with the substitution therefor of subjects directly relating to the dental service. Pending instructions from this office, you will arrange tentatively for this special instruction.

19. If any reserve officer is found unfit for the service by reason of physical, mental, moral, or temperamental reasons, you will, on vote of your staff of instructors, recommend him to this office for separation from the service.

20. Attention is invited to the administrative as well as training problems presented by your camp. The medical officers under training must be sheltered, fed, supplied, and administered, their camp policed, wastes disposed of, mounts cared for, etc.

The personnel of the regimental detachments will, in addition to their other duties, be used by you as a service corps to carry out the above duties.

21. You will, without delay, secure definite accommodations and facilities for your medical training camp, in respect to the other training camp near by, so that there may be no later interruptions, modifications, or curtailment of the work of the Medical Department camp.

22. The medical officers' mess will not be supported from Government funds. Doubtless the quartermaster can furnish the necessary kitchen and mess equipment. Cost of mess will be charged on the officers' mess bills.

23. For the purpose of practice in equitation, you will make requisition at once for the necessary number of mounts and saddle equipment therefor, on the basis of 1 mount for each 4 student officers. Make requisition also for the pack mules necessary to your 10 regimental sanitary detachments.

24. The sick from your camp will receive infirmary treatment from a camp infirmary to be maintained by you. Hospital treatment will be given at the hospitals provided for the needs of the local coordinated training camps as a whole.

You will arrange to have the use of this hospital for the instruction of medical officers in the administration of such hospitals, and the training of enlisted men as nurses and as surgical and dispensary assistants.

25. In conjunction with the training camps for medical officers, it is proposed to establish training camps for enlisted men of the Medical Department. As soon as possible you will prepare a tentative plan for the training of these men in conjunction with the medical officers' training camp and forward it to this office for consideration. Your student medical officers will have to be the instructors of the enlisted personnel under training.

^b See pp. 78, 79.

Course should be based on a three months' period, having in mind that the needs of the service may require the detachment of some of these men after six weeks' or two months' training.

26. You will also prepare and submit a plan for the instruction of selected privates who have finished the basic course proposed in paragraph 24, with a view to their promotion as noncommissioned officers. This course should not exceed four weeks.

It is proposed to appoint men who, after satisfactorily finishing the basic course for enlisted men and the additional course for candidates as sergeants, are reported by you as qualified for such promotion.

27. Instruction as detachment cooks will also be given by you.

28. Receipt of this letter will be acknowledged.

For the Surgeon General:

_____,
Colonel, Medical Corps, United States Army.

The capacity of this camp as originally announced was changed later to accommodate 200 medical officers (colored) and 1,020 enlisted men (colored), Medical Department.

The commanding officer, Fort Des Moines, was in command for the purpose of administration and supply. The Surgeon General was in control of all matters relative to instruction. At first the post surgeon, Fort Des Moines, was placed immediately in charge of instruction. The staff of instructors at that time was composed of all medical officers at this post. On August 11, 1917, the organization of the camp was changed by the appointment of a commandant, who was to assume full control of all matters pertaining to instruction and administration. The commandant arrived at the training camp on August 20, 1917, and August 27 put into full operation a course of instruction for the medical officers and enlisted men. The course of instruction for the medical officers was maintained according to the outline quoted above, and will not be repeated here.

Upon the arrival of the commandant, three instructors were on duty with the camp. That this corps of instructors was inadequate was at once realized, and upon application to the Surgeon General additional instructors were furnished.

This camp was in operation 110 days, the entire period being divided as follows: (1) Preinstruction period, July 26-31, 1917; (2) part-time instruction period, August 1-26, 1917; (3) active and intensive instruction period, August 27, 1917, to date of closure, November 13, 1917.

During the first period the camp was getting ready to receive the student officers. During the second period the student officers had begun to arrive and continued to do so until the beginning of the third period. During this period, due to lack of instructors and the daily arrival of officers, only a limited amount of instruction was given. During the third period instruction was most intensive and was given up to the limit of assimilation. The progress made by the student officers and enlisted men during this period was very satisfactory to all concerned.

Of the 118 medical officers who received instruction, 8 failed to qualify, 4 were found incapacitated for physical reasons, 1 was disqualified for moral obliquity, and 1 was discharged for general unsuitability. The remaining 104 were assigned to various organizations of the 92d Division. Of the dental

surgeons who received instruction, all qualified. Of the 1,021 enlisted men, Medical Department, who received instruction, 68 were discharged for physical reasons, 1 for fraudulent enlistment, 1 on account of dependent relatives, and 1 to answer call of the selective draft; 2 deserted. The 948 remaining were sent to various organizations.

At no time, except during the last few weeks of its existence, did this camp have adequate or satisfactory quarters for the instruction or accommodation of the officers and enlisted men. A training camp for line officers (colored) was in operation here from June 12, to October 14, 1917, making it necessary to quarter many of our officers in Cavalry stables, as was done with all the enlisted men. Some of the officers were given quarters in a band barracks, and an officers' mess was maintained. However, only 48 officers could be accommodated there. This lack of proper and adequate quarters seriously interfered with the instruction and training, but was a condition not possible to remedy until about three weeks before the close of the camp. The stables were satisfactory as dormitories until cold weather, when they became very uncomfortable. Wooden floors were built in the stalls of four of these. Each stable accommodated 160 men and, although crowded, no real inconvenience arose from this condition, as ventilation was adequate at all times.

The messing and cooking were seriously defective, due to the fact that all barracks were occupied by the line officers' training camp, and no provisions could be made to take care of the one thousand and odd men of this camp. To remedy this defect an estimate was submitted for the erection of four fly-proof kitchens and mess halls and allotments to cover this were requested to be expedited. At the close of the camp no appropriation for these structures had been made. As a makeshift, enough material was secured from an abandoned National Guard camp to erect four screened kitchens, which served the purpose as well as could be expected. No provision in the nature of a screened mess hall could be secured, and the men were required to eat as if under field conditions. Cooking was done on the ordinary field ranges with the Alamo attachment; two such ranges to each cook shack. Food served was at all times good, well cooked, and adequate in quantity. The cooking was done by the enlisted men secured from the detachment. In this connection it was the aim to develop as many cooks as possible to fill this important place in the regimental detachments.

The same remarks as to messing and cooking apply in a measure to bathing. Four shower heads were all that were provided for a thousand men, which is not consistent with proper bathing facilities. By a mutual agreement between some of the company commanders of the line officers' training camp and the commandant of this camp, certain days were allotted to the medical camp for the use of the bathing facilities of those companies. This tided over an emergency that might have been a grave sanitary defect.

The total expenditure for this camp was but \$1,830, which was principally to cover the cost of flooring the stalls of the four stables used as sleeping quarters for the enlisted men.

All the men were adequately supplied with clothing, including woolen clothing and overcoats, when, on the advent of cold weather, the issue was warranted. The real defect in this connection, was the arrival at the camp of a large number

of men with ill-fitting shoes. Some men requiring a No. 7 shoe reported here wearing a No. 11. This was corrected as rapidly as detected.

A feature of the training camp much enjoyed by officers and men was a practice march and a three-day field encampment. The entire command was taken on a 10-mile march to the State fair grounds and lived under canvas (shelter tents) for three days, October 3-6, 1917. Practical instruction was given in camp-making sanitation, regimental detachment administration, camp-infirmatory work, packing, bearer work, and field work in general. There was no disorder or accident attending this march and encampment, which constituted a most valuable instruction period.

The Young Men's Christian Association maintained in this camp a branch which was a social and recreation center for the men. A well-equipped band was also organized from the enlisted men, which added much to the contentment and happiness of the men. A baseball team and a football team were organized from the enlisted men, and some games played with local teams. The enlisted men and officers generally attended in a body. With the camp band playing at the games, a goodly feeling of corps loyalty and union, not materially different from the college student spirit, was engendered to the noticeable and material gain in training efficiency. Boxing was encouraged, and one large boxing contest, which was attended by practically all of the instructors, officers, and enlisted men, was held in a large auditorium in Des Moines.

The total attendance of this camp was as follows: Medical Reserve Corps, 118; Dental Reserve Corps, 12; enlisted men, Medical Department, 1,021.

The health of the command remained uniformly good during the entire period of the camp. No epidemic of any disease appeared, though many cases of measles developed among the newly arrived men from the recruit depots. No outbreak of measles occurred, due largely to the rule established early in the camp of removing to the hospital all cases showing coryza and elevation of temperature immediately on discovery regardless of a diagnosis. A large contributing factor in the relative freedom from measles was the use of open Cavalry stables as barracks, for a variety of ventilation was obtained by necessity superior to that possible in a cantonment under canvas. No case of measles developed in any man who had been in camp more than two weeks. In all, 34 cases developed among 1,021 men and 130 officers, of 29.54 per thousand.

The discipline of the men and officers was uniformly very good. No difficulty presented itself in the camp. Passes to the city of Des Moines were freely granted and resulted in no abuse of the privilege or disorder in the city. Fewer of the men from this camp were arrested by the local police authorities than was normal among Regular troops.

INSTRUCTION

The general scheme of instruction issued by the Surgeon General was closely followed. However the camp naturally divided itself into three schools: (a) A school for officers; (b) a school for enlisted men; (c) a school for prospective noncommissioned officers.

The work of the several schools was closely coordinated, the officers in training serving as instructors in the school for noncommissioned officers and the school for privates in the more strictly professional topics.

Instructions from the Surgeon General directed the training of regimental sanitary detachments, and in practice this camp training was limited to this branch of the medical service. The other types of medical services were explained in lecture, only to familiarize the officers and men with the nature of such activities. It was found necessary because of the lack of adequate study halls and because of the fact that the officers did not grasp the subject readily, to give more hours of instruction in paper work and the Manual of the Medical Department than the outline from the Surgeon General prescribed. For a certain part of this instruction, three night periods of two hours each were added in practical paper work each week. Each officer was required to prepare the more commonly used forms and medical blanks, and these were carefully graded and criticized.

It is believed that the limitation put upon this camp to prepare regimental sanitary detachments only was a very happy decision, as more time could be given to regimental administration with associated larger consideration of the entire subject of Army Regulations, than would have been possible had it been necessary to give in detail the various phases of medical activity such as ambulance companies and field hospitals. The enlisted men were divided into detachments of 20 men each and placed under an officer in training. The squads were known as provisional sanitary detachments and were instructed as such. Two reserve officers were assigned to each provisional regimental detachment; eight such detachments were usually quartered together, and the whole known as a provisional company, and administered as such, one medical reserve officer being designated as company commander who was assisted by two sergeants out of the Regular Army detailed as assistant instructors and noncommissioned officers in charge of barracks.

The instruction was divided among the instructors detailed to this camp by subjects, each instructor being responsible for the instruction given in the entire camp in this particular subject; this worked very well in securing uniformity of instruction in each subject throughout the entire camp.

Most of the common field sanitary appliances were constructed and the officers and enlisted men were given daily a chance to see how each was constructed and operated. In the practice marches, the officers and men of each detachment were required to construct these appliances for the use of that march, using in this construction the knowledge they had gained in camp.

The instruction of each detachment was made the subject of criticism so that quite a bit of competition to excel the results of other detachments developed, which was believed to have been very beneficial in its results.

OFFICERS

The average age of all Medical Reserve Corps officers reporting to this camp was 32.79 years. Average age of all officers, Dental Reserve Corps, reporting to this camp was 29.83 years. The officers sent out from this camp were relatively young men, averaging 31.96 years. They were recently in practice from civil life, the average years of practice being 6.03 years. The older men were not found desirable. They could not grasp the situation, had

difficulty in studying the text, and were not as well educated as the younger men. The States and schools from which the officers come, with the numbers from each, follow:

Medical and dental reserve officers by States

Alabama	4	Massachusetts	1
Arizona	1	Mississippi	4
California	3	Missouri	6
Connecticut	1	Nebraska	1
District of Columbia	5	New Jersey	6
Florida	2	North Carolina	9

The following schedule for the first six days of training will give a fair idea of the way in which the time and subjects for the training of the medical officers were divided.

First day (Aug. 27, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	Drill and school of soldier.
8.30 to 9.25 a. m.	Litter drill.
9.30 to 10.25 a. m.	Lecture, personal equipment.
10.30 to 11.25 a. m.	First aid, using soldier equipment, lecture and demonstration.
1 to 2.25 p. m.	Practical first aid.
2.30 to 4.30 p. m.	Bearer work with and without litter.

Second day (Aug. 28, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	School of the soldier.
8.30 to 9.25 a. m.	Letter drill.
9.30 to 10.25 a. m.	Field and surplus kits, equipment, medical officers.
10.30 to 11.25 a. m.	First aid, using soldier equipment only; lecture and demonstration.
1 to 2.25 p. m.	Practical first aid.
2.30 to 4.30 p. m.	Bearer work with and without litter.
7 to 9 p. m.	Reports, returns etc., pertaining to regimental detachment.

Third day (Aug. 29, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	School of the soldier.
8.30 to 9.25 a. m.	Litter drill.
9.30 to 10.25 a. m.	Care and maintenance of soldier equipment.
10.30 to 11.25 a. m.	Duties of a soldier; lecture and quiz.
1 to 2.25 p. m.	Practical first aid.
2.30 to 4.30 p. m.	Bearer work, with and without litters.

Fourth day (Aug. 30, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	School of the soldier.
8.30 to 9.25 a. m.	Litter drill.
9.30 to 10.25 a. m.	Care and maintenance of soldier equipment.
10.30 to 11.25 a. m.	Duties of a soldier; lecture and quiz.
1 to 2.25 p. m.	Practical first aid.
2.30 to 4.30 p. m.	Litter-bearer work, with and without litter.

Fifth day (Aug. 31, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	School of the soldier.
8.30 to 9.25 a. m.	Litter drill.
9.30 to 10.25 a. m.	General organization of military forces.
10.30 to 11.25 a. m.	Duties of a soldier; lectures and quiz.
1 to 2.25 p. m.	Practical first aid.
2.30 to 4.30 p. m.	Bearer work, with and without litter.
7 to 9 p. m.	Reports, returns pertaining to regimental detachment.

Sixth day (Sept. 1, 1917):

5.45 to 6 a. m.	Setting-up exercises.
7.30 to 8.25 a. m.	Inspection.
8.30 to 9.25 a. m.	Demonstration and familiarization with Medical Department equipment.
9.30 to 10.25 a. m.	Duties of a soldier; lecture and quiz.

N. B.—In this period one 2-day practice march with one night bivouac will take place, actual field conditions prevailing. Two days of this period individual cooking will prevail.			
Sunday			No instruction		No instruction

NONCOMMISSIONED OFFICERS

On September 24, 1917, there was organized in this camp a school for prospective noncommissioned officers. The students for this school were selected from the enlisted men in the camp who had completed the basic course. It was the intention to develop the noncommissioned officers from the most suitable of these men and to appoint privates first class from the others. The basis for eligibility for this school was (a) general aptitude; (b) preliminary education—a minimum being the completion of eighth grade of public schools. Two hundred and ninety-one enlisted men were chosen to take this course. Six medical officers were assigned as instructors and the following course was inaugurated September 24, 1917.

AN ADVANCED COURSE OF INSTRUCTION FOR PROSPECTIVE NONCOMMISSIONED OFFICERS

	Hours
1. Organization and duties Medical Department, Sept. 24 to 26, 1917.....	6
2. Military hygiene and sanitation, Oct. 8 to 10, 1917.....	6
3. Hospital organization and ward management, Oct. 11 to 12, 1917.....	4
4. First aid and nursing, Oct. 15 to 18, 1917.....	8
5. Instruments and appliances, demonstration, Oct. 19 to 20, 1917.....	4
6. Materia medica and pharmacy, Oct. 20 to 21, 1917.....	6
7. Field equipment, Oct. 24, 1917.....	2
8. Army Regulations, Oct. 25 to 27, 1917.....	6
9. Articles of War interpolation and explanation, Oct. 30, 1917.....	2
10. Practical instruction in care of feet, Oct. 17 to 18, 1917.....	4
11. Care and accounting of public property and paper work, Medical Department, practical, Oct. 8 to 26, 1917.....	28
12. Cooking and mess management, Oct. 8 to 12, 1917.....	10
13. Field sanitation, practical construction of appliances, etc., Oct. 15 to 19, 1917.....	10
14. Equipment, field, combat and horse, practical use of, Oct. 24 to 25, 1917.....	4
15. Tent drills, special, Oct. 26, 1917.....	4
16. Equitation, care of animals, duties of orderlies, etc., Oct. 8 to 30, 1917.....	36
17. Bugle instruction, special for those selected for bulger's course.....	36
18. Minor surgery and nursing, practical (general anesthesia, disinfection, sterilization of instruments and dressings, catheterization, preparation and administration of enemata, gastric lavage, bed making, etc.).....	35

The early call (October 29, 1927) for privates and privates first class from this school for duty with the colored organizations elsewhere terminated the course before completion and before the men could become sufficiently well qualified to assume the duties of noncommissioned officers.

As a result of this 221 were appointed privates first class, but no noncommissioned officers were made from them.

FINAL DISPOSITION OF OFFICERS IN TRAINING

Medical Reserve Corps

I. Assigned to organizations, colored troops:	
(a) Camp Upton, Yaphank, N. Y.....	7
(b) Camp Meade, Annapolis Junction, Md.....	9
(c) Camp Sherman, Chillicothe, Ohio.....	3
(d) Camp Grant, Rockford, Ill.....	7
(e) Camp Dodge, Des Moines, Iowa.....	6
(f) Camp Dix, Wrightstown, N. J.....	6
(g) Camp Funston, Fort Riley, Kans.....	66
Total.....	104

2. Disqualified as unsuitable.....	9
3. Disqualified physically.....	4
4. Disqualified for moral obliquity.....	1
Total.....	14

Dental Reserve Corps

1. 77th Division, Camp Upton, Yaphank, N. Y.....	2
2. 78th Division, Camp Dix, Wrightstown, N. J.....	2
3. 79th Division, Camp Meade, Annapolis Junction, Md.....	2
4. 83d Division, Camp Sherman, Chillicothe, Ohio.....	2
5. 86th Division, Camp Grant, Rockford, Ill.....	2
6. 88th Division, Camp Dodge, Des Moines, Iowa.....	2
Total.....	12

Disposition of enlisted men in training at this camp

1. 301 Stevedore Regiment, Newport News, Va.....	28
2. 302 Stevedore Regiment, Newport News, Va.....	28
3. 303 Stevedore Regiment, Newport News, Va.....	28
4. 304 Stevedore Regiment, Newport News, Va.....	28
5. Engineer Service Battalion, Camp Taylor, Ky.....	12
6. Engineer Service Battalion, Camp Lee, Petersburg, Va.....	24

CHAPTER III

MOBILIZATION AND TRAINING CAMP FOR MEDICAL DEPARTMENT UNITS

CAMP CRANE, ALLENTOWN, PA.*

ORGANIZATION

Camp Crane was established in May, 1917, primarily to afford a mobilization place for recruits for the United States Army Ambulance Service, the recruiting center for which was located in Philadelphia; later it was used for the mobilization of Medical Department units of all kinds.

The officers who had been detailed to develop this service¹ were ordered to Philadelphia and were directed to recommend a site in the vicinity of that city for a mobilization camp. They were instructed to secure a camp site which afforded as much shelter already constructed as possible, as military necessity required the War Department to conserve the limited amount of canvas on hand, and it had no funds, at the time, available for the construction of buildings. The grounds of the Lehigh County Agricultural Society, at Allentown, which had a dozen or more permanent buildings of construction more substantial than is usually found on fair grounds, and which were easily accessible for troops and supplies, were secured for the purpose, and were formally turned over to the Government on June 1, 1917.

All of the buildings and some of the stables and sheds that had been used for fancy stock, were utilized for shelter for the men, and later additional space was provided by the erection of frames over which tarpaulins were stretched. The most useful building on the grounds was the grand stand which was modern in every particular, constructed of brick over a heavy steel frame. It seated 10,000 people. In one end of the building were spacious offices, an express office, telegraph office, and a small jail room. The greater part of the space under the grand stand seats was occupied by restaurant facilities, consisting of a dining room, which seated over 2,500 people, with large kitchens at either end, each equipped with eight gas ranges and some large cooking utensils, such as are usually found in hotels. The building also had large lavatories in which there were over 100 modern flush closets. Seats were torn out of the greater part of the grandstand and it then afforded the preferred assignments as section quarters.

The space inside the half-mile elliptical race track was utilized for parking cars and for the garage, while the track afforded space for practice in driving cars. All of the larger buildings were equipped with running water and with electric lights.

* Unless otherwise indicated, the facts herein given are based on: History of United States Army Ambulance Service. History of Camp Crane, Allentown, Pa., by Lieut. Col. E. E. Persons, M. C. Copy on file, Historical Division, S. G. O.

As soon as practicable the Government erected 12 two-story barrack buildings of the standard type adopted for cantonments, a camp infirmary, and 2 buildings for officers' quarters. A year later 4 more barrack buildings were erected. The Young Men's Christian Association built a small "hut," the Young Women's Christian Association a "hostess house," and the Knights of Columbus a house for recreation purposes.

A central steam heating plant, with a battery of three large boilers was installed, at a cost of about \$125,000, to heat all the occupied buildings except the officers' quarters, in which a small heating plant was included. One of the largest and best of the permanent buildings was fitted up as a machine shop and garage, and as soon as the congestion in the camp was relieved by the completion of the new barracks, the largest of the fair ground exhibition buildings was turned over to the entertainment committee for amusement purposes.

Early in July several of the best noncommissioned officers of the Medical Department of the Regular Army were detailed to the camp, assistant quartermasters were assigned, clothing and supplies began to arrive, individual mess kits were issued, and the camp settled down to a comparatively normal routine.

UNITED STATES ARMY AMBULANCE SERVICE

ORGANIZATION

The United States Army Ambulance Service was unique in the history of military organizations of our Government. It was the only unit ever assembled by the Government which was intended primarily for use as a part of a foreign army, organized and equipped in a manner indicated by another nation.

When the United States declared war, the several European powers then at war with Germany sent delegations to the United States for consultation concerning the conduct of the war. Before it had been determined that America should make immediate preparations to send troops to Europe, a conference was held in Washington between the representatives of our War Department and the French High Commission, led by Marshal Joffre, with a view to determining how the United States could best aid France in her prosecution of the war. At this conference, Marshal Joffre asked, among other things, that arrangements be made to furnish France with some ambulance service; and at the request of the American representatives at the conference, he outlined the organization and equipment of the French ambulance sections, a plan of organization which he considered best adapted for the ambulance work desired. To comply with this request of the French Government, it was directed that the United States Army Ambulance Service be organized as follows:²

II. (1) Under authority conferred by section 2 of the act of Congress "authorizing the President to increase temporarily the Military Establishment of the United States," approved May 18, 1917, the President directs that there be organized for the existing emergency, the enlisted strength being raised and maintained by voluntary enlistment or draft, as a part of the Medical Department, the United States Army Ambulance Service, consisting of the following personnel:

Commissioned: Colonel 1; lieutenant colonels, 2; majors, 8; captains, 32; first lieutenants, 160; total, 203.

Enlisted: 168 ambulance sections, each consisting of: Sergeants, first class, 1; sergeants, 2; corporals, 1; mechanics, 2; cooks, 2; privates, first class, 26; privates, 11; total, 45.

(2) The following transportation is authorized for each section: Motor ambulances, 20; motor truck (2-ton), 1; motor truck ($\frac{3}{4}$ -ton), 1; motor car (5-passenger), 1; motor cycle (with side car), 1.

* * * * * *

This was amended later as follows:³

1. Paragraph 1, Section II, General Orders, No. 75, War Department, 1917, organizing the United States Army Ambulance Service as a part of the Medical Department, is amended so as to provide for a total of 34 captains, 169 first lieutenants, and 169 ambulance sections.

The orders quoted above were based on the general plan that one of the sections would be assigned to a division of the French Army; that for each 5 of the sections a repair shop and general supply depot would be established in command of a captain; that for each group of 20 sections an inspector with the grade of major would be provided, and that the higher administrative work of the service would be conducted by 2 lieutenant colonels and 1 colonel. This general scheme, like many other preconceived plans for the operation of American troops abroad, was ultimately modified beyond recognition. The senior officers of the organization, with a few sections, went to Italy for duty with the Italian Army, while the larger number of sections in France operated under the command of an officer commissioned in the Medical Corps and not in the Ambulance Service.

Plans for securing personnel and equipment were begun several weeks before the first order above quoted was promulgated by the War Department. An officer of the Regular Army at the time inspector-instructor, sanitary troops, Pennsylvania National Guard, was directed to begin recruiting for the ambulance service in Philadelphia. Applicants were enlisted in the Medical Enlisted Reserve Corps. Two experienced officers of the Medical Corps were ordered to Philadelphia to take charge of the recruits for this service. The headquarters and chief recruiting center for the organization was temporarily located in Cooper Battalion Hall, at Twenty-third and Christian Streets, Philadelphia, a building placed at the disposal of the Government for the purpose by the Episcopal Church of the Holy Apostles. Here members of the Medical Enlisted Reserve Corps were first inducted into active service on May 22, 1917.

The rumor spread rapidly that an ambulance service would probably be among the first organizations to be sent abroad, and applications for enlistments by men who were impatient to get overseas immediately were received from all parts of the United States. Colleges asked to be permitted to form complete sections of their own men, and the War Department granted their request, making the organization unique in this particular. Over 40 colleges and universities furnished one or more sections of 55 men, who were sent to Camp Crane in charge of one of the party who had been selected as leader. In addition to the men recruited at the Ambulance Service recruiting station at Philadelphia, and the large number of men enlisted at the colleges and universities, a considerable portion of the personnel was derived from the American Red Cross ambulance companies, which desired immediate service. A number of cities and a few industrial corporations contributed complete sections to the service, and a very considerable number of men came from Army recruiting stations throughout

the country which were authorized to send applicants for this service to Camp Crane. Volunteer enlistments furnished personnel for all the sections of the Ambulance Service except a few which were organized just before the armistice from drafted men, and the enlisted personnel of the service as a whole was of a very high grade. With the exception of one or two instances, all enlistments were made in the grade of private, and promotions were made on the basis of ability demonstrated after arrival at camp.

MOBILIZATION AND EQUIPMENT

Headquarters of the Ambulance Service moved from Philadelphia to Camp Crane on June 9, 1917. The first organization to arrive was the Red Cross ambulance company from Washington, D. C. When Allentown had been definitely decided upon as the site for the mobilization camp of the Ambulance Service, 3 carloads of supplies, including blankets, cots, galvanized-iron cans, tools, etc., were sent there at once under convoy of a soldier from the Quartermaster Department depot in Philadelphia. Detachments of students who had been impatiently waiting at their colleges for the announcement of the location of the camp began to pour into the camp before clothing and individual mess equipment were available. Soon after the camp was opened the number of men who reported exceeded its capacity, and from the middle of July until the 1st of December, 1917, it was necessary to keep some organizations out on practice marches constantly to relieve the congestion. No organization retained its quarters in camp while on a practice march.

The commander of the camp and of the Ambulance Service took charge of general administration and procurement of camp supplies. The personnel for entire sections was furnished by individual colleges, cities, and in some instances by corporations. These groups of men usually arrived in charge of some man whose capacity for leadership and whose enthusiasm had placed him at the head of the party. On arrival at camp this man was usually designated as acting sergeant, first class, and he assisted in selecting the other non-commissioned officers for the section. Each section was required to furnish two cooks and one man for dining-room service in the mess. Sometimes two men were found in the section who confessed to having had some meager experience in cooking, and they were detailed as cooks; but as a rule two men had to be selected at random and designated as cooks. The section mechanics were selected in the same way.

Ordnance for equipping the individual soldier, including mess kits, web belts, and other accessories were among the last articles received at the camp. The difficulties encountered in securing clothing and other personal equipment were due to inability of the depots to get the required goods and to delays in transportation.

The organizational equipment was obtained without delay. As soon as it was definitely determined what the unit equipment was to be, the necessary orders for motor equipment for 120 sections were placed.

The French High Commission was insistent in its recommendations that Ford ambulances, touring cars, and light trucks be used, based on their experience during the first two years of the war. It was stated that the lightness of

the car, its durability, and the ease with which parts could be interchanged gave it great superiority for the work to be performed. Orders were therefore placed for approximately 2,400 Ford ambulances, 120 Ford trucks, and 120 Ford touring cars, 120 Packard trucks, and 120 motor cycles with side cars, with an allowance for replacement and a fair allowance of spare parts. By special effort on the part of the manufacturers, early delivery was secured. This large bulk of motor equipment arrived at the seaboard before cargo space was at a premium, was immediately sent across, and landed at St. Nazaire to await the personnel for which it was intended. Later, reports came from France that the spare parts which were urgently needed had not arrived with the shipment of cars, and the matter was investigated here, but it was finally found that the parts had been shipped but had been abstracted by the Quartermaster Department and used for their cars needing repairs.

INSTRUCTION

The purpose and scope of the activities of this camp are set forth in the following communication:⁴

1. These instructions are intended to coordinate the work at the various medical camps of instruction so that it will be carried out on common lines.

Also that the instruction given at these camps, and that which it is proposed to give the medical personnel necessarily serving with troops to meet their needs in the field and at posts, shall have similar basis and method.

To the end that the instruction to be given, and the results to be secured, shall be standardized, the general provisions of this letter will be carried out. You are authorized to modify the general outline of instruction given in paragraph 14, to meet limitations imposed by time and the technical nature of the ambulance service. All details of execution are left to you and you are held responsible for proper results.

2. The course is intended to give student officers a general idea of the basic duties of a medical officer and prepare them for service with troops in the field.

Training will be intensive and pushed as rapidly as possible. It will be borne in mind that the services of thousands of instructed medical officers must be available at an early date. Also that your officers, though now assigned to ambulance work, may be detailed to duty with troops or hospitals and should be grounded in the duties pertaining thereto.

3. The training to be given is intended to prepare these officers to conduct the service of the Medical Department without either the supervision of experienced medical officers or the aid of well qualified noncommissioned officers. The limited number of these two renders it probable that few, if any, will be available for regimental duty, or with ambulance companies and field hospitals.

For this reason, also, upon the reserve medical officers will fall the duty of themselves drilling and training the very many thousands of enlisted raw recruits which will be assigned to the Medical Department, and they must be put into a condition to carry out effectively this most important work.

4. Student officers will be assigned to sanitary units, and receive advanced systematic instruction coincident with the more elementary instruction they will be expected to give to their subordinates.

5. You will make such assignments to instruction duty as you deem best, making due effort to assign to each subject officers known to you to have given special attention thereto and to possess ability to impart information.

You are authorized to use as instructors any student officers found specially qualified in any subject, and to give them special authority while serving, irrespective of rank.

6. Instruction by lectures, except in special subjects, will, as far as possible, give place to recitations. Lectures are not considered as effective as recitations in imparting detailed

information, nor do they afford opportunity to test the capacity and grade the student. Further, your personnel of trained officers is not large enough to cover all subjects by lectures.

Lessons will, therefore, be assigned in the authorized textbooks, and quizzes held thereon, for the purpose of grounding them in theory and insuring that a competent knowledge of methods and principles has been acquired.

7. Coincident with this theoretical instruction, the student officers should as far as possible be made to visualize the organizations, apparatus, and methods concerned. In addition to study and lectures, it is most important that they should learn by seeing and doing. So far as possible, instruction will be made practical.

To this end, for example, specimens of all sanitary appliances and methods likely to be of use in field work will be procured or constructed and continually kept in effective operation at the camp, and the officers will be shown their purpose and practical use.

Bombproofs for trench warfare and gas chambers for practical trial of protection against poison gases will be constructed.

In connection with paper work, all papers required by the medical and other departments will be actually made out until familiarity therewith and correctness of result is secured.

Mess management, taught in theory, will be actually demonstrated in the organization kitchens. Applied camp sanitation will be taught by sanitary inspections. Drill will be taught until every officer can himself effectively handle and instruct therein the units and detachments of the Medical Department.

The internal economy and administration of regimental detachments, ambulance companies, and field hospitals will be thoroughly taught.

8. The training course will be divided into three periods. The first, while instructing the officer as such, is intended especially to familiarize him with the duties of his enlisted subordinates whom he must shortly train. The second takes up his training in his own special functions as an officer. The third carries on and completes the work of the second period.

Now, training classes should as far as possible be started at the conclusion of each month's training period. However, to meet immediate needs, officers needing training will be organized at once into groups for instruction.

9. The following textbooks are authorized for the course of instruction: Army Regulations; Manual for the Medical Department; Field Service Regulations; Drill Regulations for Sanitary Troops; Manual for Courts-Martial; Army cook books.

These books will be invoiced to you without requisition. You will issue one copy of each to each student officer, who will take them with him when he leaves camp for duty elsewhere for reference and use in training his subordinates.

Maps and war-game sets will be sent out on requisition.

You will procure maps of the maneuver grounds in the vicinity of your camp from the commanding general of your department. One map should be available to each student officer.

10. The following school textbooks will be sent you without requisition. They are for use in your training work and will not be taken away by officers.

Field Physical Training of the Soldier, Koehler. (Special Regulations No. 23.)

Manual of Physical Training, Koehler.

Technical Military Dictionary (English-French and French-English), Willcox.

Manual for Noncommissioned Officers and Privates of Infantry, 1917.

Handbook for Sanitary Troops, Mason.

Medical Service in Campaign, Straub.

Elements of Military Hygiene, Ashburn.

Principles of Sanitary Tactics, Munson.

Military Hygiene, Havard.

Sanitation in War, Lelean.

Gunshot Injuries, LaGarde.

Military Surgery, Penhallow.

Surgery in War, Hull.

Also Merton's life-size first-aid charts.

In addition, a miscellaneous assortment of reprints, bulletins, etc., will be sent you for reference and distribution; also a series of current medical publications.

11. The daily instruction, except Saturday afternoon and Sunday, should approximate seven and one-half hours daily.

It is left to the commandant of each medical officers' training camp to prepare schedules for the hours available in each period of instruction among the subjects and time therefor required. This will enable the meeting of the needs of emergency, stormy weather, etc. Copies of the detailed schedules so prepared by you will be furnished this office as soon as practicable.

12. The following general scheme is suggested as a daily schedule:

6 a. m.-----	Reveille.	11.30 to 12.55---	Dinner, rest, etc.
6.15 to 6.30-----	Setting up.	1 to 1.55 p. m---	Quiz or lecture.
6.35 to 7.25-----	Breakfast; police of quar-	2 to 2.55 -----	Quiz or lecture.
	ters.	3 to 4.25-----	Drill.
7.30 to 8.25-----	Drill (marching).	4.30 to 5.55-----	Care of transportation,
8.30 to 9.25-----	Drill (special).		supper, rest, etc.
9.30 to 10.25----	Quiz or lecture.	6-----	Retreat.
10.30 to 11.25---	Quiz or lecture.		

13. On this general plan, 180 hours of formal instruction will be given monthly. No evening exercises are contemplated. Time will be needed for study. Saturday afternoon should be a rest period. Officers should be encouraged in ambulance work on Sunday.

14. The following scheme shows the proposed scope of training of medical officers during the first period: ^b

* * * * * *

15. To stimulate student officers to their best work, a certain number of places in the grade of captain and major, Medical Department Officers' Reserve Corps, will be left unfilled. Appointment will be made to those vacancies from among the student medical officers who, on vote of your staff of instructors, are recommended by you as possessing such exceptional knowledge, aptitude, and efficiency as would qualify them for such increased rank.

To this end you will establish and maintain a graded system of marking, by which relative efficiency will be recorded.

16. Also medical officers satisfying the age and other requirements and after passing such examination as the Surgeon General may require, may, on your recommendation, and subject to the vote of your staff of instructors, be commissioned at once as first lieutenants in the Medical Corps of the Army.

17. If any reserve officer is found unfit for the service by reason of physical, mental, moral, or temperamental reasons, you will, on vote of your staff of instructors, recommend him to this office for separation from the service.

18. In conjunction with the above training plan for medical officers, it is desired to establish a training scheme for enlisted men of the Medical Department. As soon as possible you will prepare a tentative plan for the training of these men in conjunction with that for medical officers and forward it to this office for consideration.

Course for enlisted men should be based on a six weeks' period.

19. You will also prepare and submit a plan for the instruction of selected privates with a view to their promotion as nonecommissioned officers.

It is proposed to appoint men who, after satisfactorily finishing the basic course for enlisted men and the additional course for candidates as sergeants, are reported by you as qualified for such promotion.

20. Receipt of this letter will be acknowledged.

By order of the Surgeon General.

Colonel, Medical Corps, United States Army.

A schedule of instruction, based on the general scheme for instruction published by the Surgeon General for use at medical officers' training camps,⁵ was put in operation, with modifications suitable for the needs of the camp.

^b See pp. 78, 79.

The purpose which dominated the activities of the camp was the development, training, and equipment of an organization for active service overseas in as short a time as possible. The greatest asset in the accomplishment of this task was the eagerness of the personnel to assist in the organization and to receive the training; the greatest handicap in the accomplishment of the task was the lack of instructors. At the beginning, Medical Reserve Corps officers were assigned to command sections. As a rule, they were exceptionally high-grade men, who entered enthusiastically into the work. They were gradually replaced, however, by men promoted from the ranks and given commissions in the Ambulance Service, so that when the armistice was signed there were few medical officers on duty with the service, and most of the commissions in the Ambulance Service were held by men who had entered the service as privates. The policy underlying the instruction was that the instructor must know thoroughly and be able to do what he was trying to teach. Mornings were devoted to strictly military instruction and afternoons to special instruction, drawing of clothing and equipment, fatigue, etc.

Automobile mechanics and others familiar with the Ford motor were assigned to duty at the garage as instructors. With the equipment available it was found impracticable to instruct more than 500 men at one time at the garage. Five men from each section were therefore detailed to the garage each afternoon, and as soon as a man showed that he was proficient he was given a "qualification card" and returned to his section and another man was sent to the garage in his place. Though it was confidently believed that most men in training during the early days of the camp would be motor drivers, they were all given instruction in the Drill Regulations for Sanitary Troops, on the principle that every enlisted man in the Medical Department should become familiar with this manual. As a matter of fact, hundreds of these men were later detached and sent to organizations where this knowledge was vital to their efficiency.

In July four additional officers of the Regular Army Medical Corps were assigned to the camp as instructors and about 100 Medical Reserve Corps officers reported, and were all assigned to some duty in connection with the routine activities of the camp, most of them being placed in command of Ambulance Service sections.

Throughout the greater part of the period from the organization of the camp to the middle of October, 1917, about half of the command was kept on practice marches of a week to one month through the surrounding country.⁵ This was not only for purposes of training, but because of the congested condition of the camp. It was found that a new scheme must be provided even for those left in camp, as under the schedule then in force all elements of the command pursued the same work at the same hours daily. This caused extreme crowding of the available drill grounds, so on October 15 a new schedule, providing for rotation of the various battalions on the drill grounds and in classroom, was put into effect. This provided instruction for two-thirds of the battalions, while the other third was kept on practice marches. For severe weather, when it might be necessary to discontinue practice marches, the schedule provided for handling all battalions in camp after November 11, 1917.

The results of the instruction given were very good, on the whole.⁶ The congestion of the camp, the hurried preparation for and constant expectation of overseas service, the constant replacement of medical reserve officers by newly commissioned nonprofessional officers of the Army Ambulance Service, and the lack of a sufficient number of experienced officers served as handicaps of the work. This was compensated for to some extent, however, by the experience gained by every officer on duty in the camp in handling men in camp and on the march, and in managing the administrative details of an individual organization.

UNITS SENT OVERSEAS

In July, 1917, a senior colonel of the Medical Corps was designated as chief, United States Army Ambulance Service, and accredited to the French Government to arrange the details for the operation of the service and for the enlistment of the personnel of the ambulance sections of the American field service and of the American Red Cross. He visited Camp Crane before sailing for Europe, and it was arranged that 20 sections, for which complete equipment had been secured, should follow him to France, as soon as ocean transportation was available. The dispatch of these 20 sections was accomplished early in August, 1917.

In the meantime, our Government had decided to put an army in Europe as rapidly as possible, and the priority list for shipment of troops across was based on calls for them from general headquarters in Europe. Some differences of opinion had developed in France as to the number of American ambulance sections required by the French Army, and until these were adjusted no place on the priority sailing lists could be secured for the sections which were impatiently waiting transportation at Camp Crane. Finally 10 more sections at the end of December, 1917, 17 sections in January, and 5 in March, 1918, went across, making a total of 52 sections sent from Camp Crane in service in France before the armistice was signed. The French contingent of the United States Army Ambulance Service during active hostilities, therefore, consisted of about one-third "militarized" sections and two-thirds Camp Crane sections.

Events unforeseen at the formation of the Ambulance Service resulted in modifications of the original plans in such a way that 30 of the sections originally intended for France were finally sent to Italy for service with the Italian Army; and later 15 of these sections, with a few from the French contingent, were assigned to the American Army in France.

Thus it occurred that in the decisive contests of the summer and autumn of 1918, sections of the United States Army Ambulance Service were on duty with the American Army and the Italian Army.

Troops left Camp Crane for overseas as follows:

1917, July-----	3 base hospitals.
August-----	20 Ambulance Service sections.
November-----	1 overseas gas defense service unit.
December-----	10 Ambulance Service sections; 200 casuals.
1918, January-----	17 Ambulance Service sections.
March-----	5 Ambulance Service sections; 300 casuals.
April-----	400 casuals; replacement hospitals "A"; mobile optical unit.
May-----	2 evacuation hospitals; 1 base hospital.

June.....	30 Ambulance Service sections to Italy; 1 headquarters detachment to Italy; 1 hospital detachment to Italy; 2 machine-shop truck units to Italy.
July.....	4 evacuation ambulance companies; 100 casualties (company No. 11); 1 mobile operating unit; 1 machine-shop truck unit; 4 base hospitals; 1 replacement unit (300 men).
August.....	10 automatic replacement draft units (250 men each); 1 replacement unit (100 men); X-ray unit No. 1; 1 evacuation ambulance company; 1 base hospital.
September.....	1 exceptional medical replacement draft unit (241 men); 5 automatic replacement draft units (250 men each).
October.....	1 automatic replacement draft unit; 31 Ambulance Service sections; 6 sanitary squads.
November.....	22 evacuation ambulance companies; 6 mobile hospitals; 4 mobile surgical units.
Passed through Camp Crane:	
Officers.....	2, 085
Men.....	18, 225
Total.....	20, 310

The Government property on the fair grounds was sold and removed in the early spring of 1919. The camp was formally closed, and the fair grounds turned back to the owners April 10, 1919.

CHAPTER IV

TRAINING IN DIVISIONAL CAMPS AND IN POSTS

IN DIVISIONAL CAMPS

One of the main purposes of the medical officers' training camps which were instituted in June, 1917,¹ was to provide for the tactical divisions, to be mobilized the following September, as great a number as possible of officers who in the intervening months would be given sufficient instruction in medico-military matters to enable them to take up on a great scale the instruction of divisional Medical Department personnel.

The scheme of training, as noted before, was the outcome of our experiences on the Mexican border, 1916-17, and was promulgated in May, 1917, to the division surgeons of divisions then existent, in order that the work to be done along this line in the medical officers' training camps might be anticipated somewhat. These instructions were as follows:²

1. These instructions are intended to coordinate the training of officers and enlisted men of the Medical Department with that to be given at the training camps of the Medical Department, of which it is expected that four will shortly be established. In order that such instruction shall be standardized throughout the military service, the general provisions of this letter will be strictly carried out. All details of execution are left to you, and you are held responsible for proper results.

2. To this end, you will appoint a specially qualified officer as "training officer," whose chief functions will be, under you, to take charge of the details of training work and by close supervision see that these are effectively carried out. You will also yourself give much attention to this highly important matter, by supervision, inspection, etc.

You will also make arrangements by which the routine duties of medical officers and men serving with troops shall not unduly interfere with their systematic and progressive instruction and training.

3. The course of instruction is intended to be basic. Training will be intensive and pushed as rapidly as possible. The services of thousands of instructed medical officers must be available at an early date. They must be fitted to intelligently undertake field work with independent organizations, under conditions in which many of them will not have either the supervision of trained officers or the aid of well-qualified noncommissioned officers. The training, drilling, etc., of the many thousands of enlisted recruits of the Medical Department will shortly devolve upon them. They must be thoroughly qualified to do it. The military exigency requires that few trained medical officers can be spared for your division. Their places will have to be filled by medical officers of the Officers' Reserve Corps, most of whom will be absolutely without experience or training. The responsibility for seeing that they get such training in an effective way and in as short a time as possible rests with you. New officers, as they may join you subsequently, will be at once put under training.

4. Your staff of instructors will have to be arranged for by you. Individuals who are qualified and those only partly qualified will have to instruct those who are not qualified at all. You will make every effort to assign as instructors in any subject officers who are especially conversant therewith. Where troops are aggregated in considerable numbers, you will organize general classes or schools, with fixed hours for sessions. Where the sanitary personnel is present in small numbers, its instruction will nevertheless be systematically prosecuted, and its efficiency checked up by frequent inspection by yourself and your assistants. For assistance in map reading, the tactical part of medicomilitary problems and maneuvers, and special lectures, you should secure the services of selected line officers.

5. Instruction will as far as possible be by recitations in theory, and demonstrations in practice. Student officers should be made to grasp the principles, and then visualize the organizations, apparatus, and methods concerned. To this end, for example, all sanitary appliances and methods likely to be of use in field work will be procured or constructed and kept in operation, and systematized demonstration will be made of their purpose and practical use. Bombproofs will be constructed, protective apparatus against poison gas tested, etc. All official papers required will actually be made out until familiarity therewith and correctness of result is secured. Applied camp sanitation will be taught by sanitary inspections. Drills will be prosecuted until every medical officer can himself handle and instruct therein the enlisted personnel of the Medical Department. Officers and men will be given interchangeable duty, for fixed periods, between the regimental detachments, ambulance companies, and field hospitals to learn their internal administration and their handling on marches and comprehensive field problems.

6. The training course for officers will be divided into three periods: The first, while instructing the officer as such, is intended especially to familiarize him with the duties of the enlisted recruits of the Medical Department which he will shortly be called on to train. The second takes up his training in his own special functions as an officer. The third carries on and completes the course of the second period. As fast as an officer qualifies in a subject, he will be advanced to another. Ordinarily, qualification will be determined by brief oral examination or practical demonstration.

7. The following official books will be used in the course of instruction: Army Regulations; Field Service Regulations; Manual for the Medical Department; Tables of Organization; Drill Regulations for Sanitary Troops; Manual for Courts-Martial. You will at once make requisition so that each officer not fully supplied will have a copy. Any other books which may be used will be announced later. You will make requisition for enough war-game maps and sets so that each officer will have access thereto. Procure maps of any maneuver grounds in the vicinity of camps which will be used in your maneuver work and if possible issue a copy to each officer.

8. You will arrange, if possible, to give at least four hours systematized and progressive instruction to medical officers daily, except Saturday afternoon and Sunday. The daily schedules for such instruction you will prepare yourself, bearing in mind the subjects to be covered and the time which it is desired to devote to each subject, as set forth later in this letter. Schedules should be made out for one month at a time, following the plan of dividing the instruction into three periods. Copy of schedule as prepared by you will be furnished to this office without delay. Effort should be made to arrange routine duty so that the entire afternoon can be devoted to instruction, with, if possible, one hour in the morning in addition.

9. The following subjects will be thoroughly taught during the first period: Setting-up exercises (15 minutes daily); drills, 2 hours daily; inspections; equitation; bridling, saddling and care of animals; tent pitching, shelter and pyramidal; personal equipment of sanitary soldier; field and surplus kits; care of equipment; first aid, using soldier's equipment only; examination of recruits, including papers and finger prints; nature and employment of regimental medical supplies; customs of the service; relation of Medical Department to rest of Army; general organization of the Medical Department for war; general organization of military forces; Manual for the Medical Department; Army Regulations; military hygiene and sanitation; Field Service Regulations; paper work relating to the Medical Department; map reading, use of compass, orientation, etc.

The second period will include: Setting-up drill (15 minutes daily); drills (1 hour daily); inspections, equitation, and care of animals; tent pitching, hospital tentage; elementary position and road sketching; the regimental detachment, its use and internal administration; the ambulance company, its equipment, use and internal administration; the field hospital, its equipment, use and internal administration; lectures by line officers on the tactical use each of Infantry, Cavalry, Field Artillery, Signal Corps, Engineer Corps, and quartermasters' supply work in the field; paper work relating to the Medical, Quartermaster, and Ordnance Departments (continued); the Medical Department in campaign; the principles of sanitary tactics; map problems; war games; military hygiene and sanitation (continued); Army Regulations (continued); Manual for the Medical Department (continued).

The third period will include: Setting-up drill (15 minutes daily); drills (1 hour daily); inspections; handling of rations and mess management; Manual for Courts-Martial; Articles of War; Geneva and Hague conventions; The Rules of Land Warfare; military surgery; poison gases, their nature, protection against, and treatment of; liquid fire; shell shock; war psychoses and neuroses; malingering; demonstration of trench system, including bombproofs, dugouts, entanglements, abatis, etc.; trench warfare, "trench foot"; cantonment hospitals, their organization and management; sanitary service, lines of communication; hospital ships, ships for patients, hospital trains and trains for patients; base hospitals, their organization and management; contagious disease hospitals, casual camps, convalescent camps, camps for prisoners of war; organization, functions, and limitations of the American Red Cross; civil sanitary function of the Army Medical Department in occupied territory; war games; tactical walks and rides; sanitary inspections; practice march and bivouac (2 days); practical field maneuvers, including brigade and divisional problems, with not less than two night problems, and using regimental detachments, ambulance companies, field hospitals, stations for slightly wounded. "Dummy" wounded in large numbers will actually be handled. Problems will include the attack, retreat, planned defense, and encounter, with all arms.

10. Dental surgeons and veterinary surgeons will take the general course for medical officers, with the exception of subjects which pertain more or less exclusively to the work of medical officers as such, and the substitution therefore of subjects directly relating to the dental or veterinary service. Pending instructions from this office, you will arrange tentatively for such special instruction.

11. Medical officers who demonstrate exceptional knowledge and ability as a result of this training course will be recommended by you for advancement in rank. A certain number of vacancies in the grade of major and captain are being left unfilled for this purpose. Also officers so excelling, who satisfy the age and other requirements, will be recommended by you to this office for examination with a view to their being commissioned at once as first lieutenants in the Medical Corps of the Army.

12. If any reserve officer is found unfit for the service by reason of physical, mental, moral, or temperamental reason, you will recommend to this office his separation from the service.

13. You will arrange with military hospitals in the vicinity of troops to furnish facilities for instruction of medical officers in the administration of such hospitals, and in the training of enlisted men as nurses and surgical assistants.

14. Pending further instructions from this office, you will prepare and put into effective operation, without delay, a course of intensive instruction and training for enlisted men of the Medical Department. Schedule of the above will be furnished this office. Eight hours of instruction per day, except Saturday and Sunday, will be required. Four hours' instruction will be required on Saturdays. In computing the amount of instruction given, the time actually consumed by enlisted men in the performance of regular duties will be given credit.

15. You will arrange for advanced instruction to be given selected men with a view to their promotion to be noncommissioned officers or assignment as nurses, surgical assistants, dispensary assistants, dental surgeons' assistants, and clerks. Copy of your plans and schedules will be furnished this office.

16. In view of the great need for noncommissioned officers, it is desired to promote selected enlisted men as rapidly as they are found qualified.

17. Selected men to be cooks, horseshoers, farriers, saddlers, mechanics, and chauffeurs should be instructed in such general training institutions for these subjects as are, or may be, available to the enlisted men of the line in your division.

* * * * *

Unfortunately, it was impossible to provide accommodations at medical officers' training camps for all the officers and enlisted men that would be required for the Medical Department units of the divisions organized in the early fall of 1917; other units had to be provided for besides the divisional units, and these had to be organized simultaneously. Consequently, though

104 medical officers and 1,455 enlisted men, Medical Department, were required for each of the divisions organized under War Department Tables of Organization, August, 1917, only 60 medical officers and 310 enlisted men, partially trained, could be furnished for each of the National Army divisions so organized.³

On October 3, 1917, the following letter of instruction,⁴ sent to the division surgeon of each division, augmenting instructions previously issued, was intended as an outline for the training of all divisional Medical Department personnel. The course of instruction thus prescribed was to be carried out as rapidly and as completely as local conditions permitted, and was to be concluded only when the Medical Department personnel under instruction demonstrated their qualification before a board of medical officers appointed by the division surgeon.

1. These instructions are intended to coordinate the work of training medical personnel in all divisions so that it may be carried out on common lines. To this end, the general provisions of this letter will be strictly observed. All details of execution are left to you, and you are held responsible for proper results.

2. With the concentration of troops in divisions, each division will, so far as the Medical Department is concerned, constitute a training unit for its sanitary personnel, both commissioned and enlisted.

3. This training will consist of two parts, one in which the medical personnel is trained in their military duties and military environment, the other in which the medical personnel is trained in such professional matters as are created or affected by such military environment. Both are necessary.

4. It is realized that with the organization of new troops there must first be a period for organization, equipment, and supply. Under such conditions, with green men, the performance of almost any military duty is new and valuable as a matter of education. For this reason, the scope of instruction may safely be left to detachment and unit commanders for some weeks, subject to the oversight of the division surgeon. But on November 1 the present plan of medical divisional training will be put into operation and continued as long as the division remains in the United States.

5. This Nation is at war, and training must be intensive and arduous so that the sanitary personnel may be fitted for service with the least possible delay. It is a time which calls for every effort and self-sacrifice, and sloth, indifference, and inertia on the part of individuals must not be tolerated. The efficiency of the Medical Department as a whole, as well as in each division, with a personnel composed in large part of those inexperienced in the military service, very clearly depends upon the thoroughness and efficiency with which training is carried out.

6. It must be emphasized that the duties of the Medical Department are multifarious, that all are necessary, that any and all individuals may be called upon with little or no notice to perform them, and that training in one line of sanitary duty may give little or no preparation for other lines of work equally important. It is not possible to limit the liability of any individual to one class of duty. Hence each must be prepared to efficiently carry out any of the various duties which he will very likely be called upon to perform from time to time.

7. It is obvious that the proper performance of the routine daily duties of the sanitary personnel is of the greatest immediate importance and must be effectively carried out. But it is equally true that some hours daily should be available after this daily routine is accomplished, and this spare time should be effectively used in preparing for future duties and probable contingencies.

8. Training will be carried out under direction of the division surgeon, who will prepare a schedule of systematic training in general conformance with this letter of instructions, and submit the same to the division commander, with request that it be issued as a division order. The division surgeon will see that the provisions of such order as may be issued are strictly carried out in both letter and spirit, and that every opportunity for training is taken advantage of by study, drill, and field exercises.

9. To assist him in this most important work of preparing his sanitary personnel for war service, the division surgeon will designate a suitable medical officer as "training officer," and if necessary request his relief from other duties. The duties of the "training officer" will be, under the division surgeon, to classify the personnel, both commissioned and enlisted, into suitable groups for training according to their relative knowledge and experience, arrange for competent instructors, recommend the subjects and hours of instruction for each group, and, by constant supervision and assistance, verify and promote the efficiency of the training work.

10. In each camp there will be found a considerable proportion of officers and men who have had a certain amount of military experience, either at a medical officers' training camp or through previous service. This personnel should be sought out and their services fully utilized as instructors. The well trained must aid the partly trained, and both must unite to teach what they know to the large group of the wholly uninstructed. They are the instructors upon whom the training officer must rely to carry out the details of his work.

11. Officers and men detailed by you as instructors should be given special authority while serving as such, irrespective of rank.

12. In a general way, the course of instruction should be considered to cover about a three months' period. Schedules should provide for its completion by January 15 to February 1. Troops going abroad before that time will necessarily discontinue this course of training.

13. Attendance at all training exercises and lyceums is a military duty. No person should be excused from attendance except for official reasons and in emergency. Check lists of attendance will be kept and absentees reported to the proper officer. Excessive routine duty will not be accepted by this office as an excuse for failure to carry out a reasonable amount of training.

14. As far as possible, the training to be given sanitary personnel will be coordinated. For this purpose, there must be systematized rotations of duty. As soon as an officer or enlisted man is able to efficiently perform the task set him, he should be given opportunity to learn something else. The regimental sanitary personnel, after becoming competent to handle regimental work, should be temporarily assigned in detachments to ambulance companies and field hospitals—and vice versa—for mutual familiarity with the duties and methods of these diverse organizations. It is realized that these changes of duty for instruction purposes may be objected to by subordinate commanders as interfering with the highest efficiency of their organizations. Such objections should not be entertained. The efficiency of the medical service of the division as a whole is first to be considered, and until this has been secured to the satisfaction of the division surgeon all regimental detachments and sanitary units of the division should be regarded as training organizations.

15. The subjects in which medical officers must be qualified are as follows:

Setting up. Medical officers will take this daily with the troops to which they are attached.

Drills; marching, litter, ambulance, other means of transport.

Inspections; personnel and environment.

Equitation; saddling, bridling, care of animals.

Tent pitching.

Personal equipment of the soldiers; its care, field and surplus kits.

First aid; using soldiers' equipment.

Examination of recruits, with papers and finger prints.

General organization of the military forces of the United States.

General organization of the Medical Department for war.

Relation of the Medical Department to the rest of the Army.

Paper work, relating to the Medical Department.

Paper work, relating to the Quartermaster's Department.

Paper work, relating to the Ordnance Department.

Customs of the service.

Duties of the soldier.

Army Regulations.

Manual for the Medical Department.

Field Service Regulations.

Military hygiene, and applied camp sanitation, including sanitary inspections.

Map reading, use of compass, orientation, etc.

Elementary road and position sketching.

The regimental detachment; its use, equipment, and administration.

The ambulance company; its use, equipment, and administration.

The field hospital; its use, equipment, and administration.

The Medical Department in campaign.

The principles of sanitary tactics.

The tactical use of Infantry (lecture by line officer).

The tactical use of Field Artillery (lecture by line officer).

The tactical use of Cavalry (lecture by line officer).

The uses of the Engineer and Signal Corps (lecture by officers of service concerned).

The service and mechanism of quartermaster supply in the field (lecture by quartermaster).

Map problems.

War games.

Tactical walks and rides.

Practice marches and bivouacs.

Practical field maneuvers, including brigade and divisional problems, with not less than three night problems utilizing regimental detachments, ambulance companies, and field hospitals in coordination. Problems will include the attack, retreat, planned defense, and rencounter, with all arms. As far as possible, they will be carried out in actual conjunction with problems by line troops.

Handling of ration, food economy, and mess management.

Manual for Courts-Martial and Military Law.

The Articles of War.

The Geneva and Hague conventions.

The Rules of Land Warfare.

Military surgery.

Poison gases, protection against, and their effects.

Liquid fire, trench foot.

Shell shock; war psychoses and neuroses.

Diseases common on the Western Front.

Malingering.

Cantonment, evacuation, base and general hospitals, including their organization, administration, records, management, etc.

Sanitary service of the line of communications.

Contagious disease hospitals, casual camps, convalescent camps, camps for prisoners of war.

Organizations, functions, and limitations of the American Red Cross.

The civil sanitary function of the Army Medical Department in occupied territory.

All medical officers of the division will be required to qualify in the entire course.

16. Much of the instruction should be by recitations and field work. In connection with paper work, all papers required by the medical and other departments will be actually made out until familiarity therewith and the correctness of result is secured.

17. To insure due diligence in training work, a board of three senior medical officers should be established in each camp to verify the competency in each subject of officers reported to them as qualified therein. No officer should be excused from training in a subject until the above board has reported him as qualified.

18. The attention of all officers, with the division, should be drawn to the fact that their efficiency and value to the service will largely depend upon the use they make of their opportunities for training.

The second increment of the National Army will come into being about the time the training of your medical officers will be completed. A large number of officers competent to

perform the more important duties connected with this second draft will be required. This office proposes to call for recommendation as to the medical officers and enlisted men of present divisions who by their zeal, industry, and aptitude have fitted themselves for positions of higher rank and larger authority with organizations to be created later.

19. On the other hand, medical officers who through indifference or inertia fail to qualify themselves properly for their duties, and who do not respond to local disciplinary measures, should be recommended by you to this office for summary separation from the service.

20. It is proposed to check up the efficiency of divisional training by frequent inspections of officers of the Inspector General's Department and by special inspectors from this office.

21. The textbooks authorized and published by the Government are as follows:

- Army Regulations.
- Manual for the Medical Department.
- Drill Regulations for Sanitary Troops.
- Field Service Regulations.
- Rules of Land Warfare.
- Tables of Organization.

Each officer should possess a copy for study and reference. You should make requisition without delay for such number of those as may be required to meet the needs of the commissioned and enlisted personnel of your division.

22. The books of reference authorized are as follows:

- Military Hygiene, Ashburn.
- Sanitation in War, Lelean.
- Notes on Sanitation, Vedder.
- Gunshot Injuries, LaGarde.
- Military Surgery, Penhallow.
- Sanitary Tactics, Munson.
- Medical Service in Campaign, Straub.

Also any handbooks published under authority of the Surgeon General.

It is intended that a sufficient number of these should be kept in the base hospital, to meet all needs. They should be kept in the hospital library, and be loaned as required to all medical officers.

Professional magazines issued to such hospitals should be available to all concerned.

23. Training will, as far as possible, be made practical. Medical officers and enlisted men of the Medical Department, after learning in theory how a duty should be performed, should be made to actually do it in practice.

24. Divisional sanitary detachments and units must not be allowed to become sedentary. Drills about camp and short marches with return to camp are not sufficient. There must be frequent "hikes" of several days duration, with overnight camps. Nothing prepares for field service like field service.

A minimum of eight hours work a day should be required. There should be not less than four hours work on Saturday. Credit should be allowed for time actually spent in the performance of necessary routine duties. Sunday should be regarded as a day of rest. In addition, not less than three evenings a week should be designated as lyceum nights, when all available medical officers should be required to meet for lectures, conferences, discussions, clinics, war games, etc., on matters pertaining to the medical sciences and military service.

25. Beside the training along medico-military lines already outlined, there must be training along professional lines, especially when these are subject to modification from civilian standards by reason of military necessity and environment. There is opportunity to broaden the outlook and add to the professional efficiency of all. But the professional subjects in which there is an immediate and direct application to the military service are of the first importance.

26. As part of the training course along professional lines, the various specialists attached to the base hospitals, and others sent out by this office, will give outline courses along the lines of their work on which it is important that medical officers in general should be informed. These will take the form of lectures, demonstrations, clinics, presentation of cases, etc. Instructions as to the nature and scope of the formal instruction to be thus given will be sent direct by the several specialists, divisions of this office to the specialists concerned.

27. The subjects of general and orthopedic surgery, general and military medicine, advances in hygiene and sanitation, diseases and injuries of the brain, head, eye, ear, nose,

and throat, bacteriology and pathology, genitourinary diseases, psychiatry and neurology, Roentgenology, and medical and surgical supplies will be thus covered.

28. The lectures, demonstrations, etc., to be given by specialists in their respective subjects are to be practical. They are not intended to turn the general practitioner class of medical officers into specialists, but to outline to such general practitioners their part in the prevention and cure of important disorders and disabilities through early diagnosis and proper action and the manner in which specialists can be of service to them in the more obscure cases of illness or injury, with some discussion of the specialists' methods to be employed. They are intended to demonstrate how better professional teamwork may be accomplished.

29. This course of instruction by specialists and lyceums will be arranged by the commanding officer, base hospital, who should confer with the division surgeon as to the hours and places most convenient for all concerned.

30. This office proposes to maintain a circuit for certain lectures by authorities in their subjects, to be illustrated by moving pictures and lantern slides. The adjutant of the Army Medical School, Washington, D. C., will handle all details relative to this illustrated lecture circuit. Moving pictures of a nonprofessional nature, but illustrating general military service with troops, will also be sent out for exhibition. The purpose of these pictures is to familiarize medical officers with the conditions and difficulties of the military environment, and of the functions of the other branches of the service with whom they will be associated. The exhibition of such pictures will be credited as part of the lyceum course.

31. You will also prepare a course of training for enlisted men, intended to familiarize them, first, with their present duties, and then systematically give them an insight into the other varieties of service under the Medical Department which they may be at any time called upon to perform.

32. You will also establish and maintain a school for candidates for promotion as non-commissioned officers. Details of this course are left to you.

33. Suitable arrangements will be made by you for the effective special instruction of selected men required for dispensary and surgical assistants, ward masters, clerks, cooks, chauffeurs, blacksmiths, farriers, saddlers, and other special duties.

34. Schedules of instruction covering the above subjects will be prepared by you without delay. Copies of such schedules will be furnished this office for its information prior to the beginning of the training course.

35. The mounts and animals of the regimental detachments, ambulance companies, and field hospitals should be used in instruction of all officers and enlisted men in equitation, driving, and packing.

* * * * *

The proportion of Medical Department personnel called into the service which could be accommodated at the medical officers' training camps became smaller as time passed, and the incoming draft increments increased and the number of officers and men ordered directly to divisions, who had never received any military training whatever, continued to increase in the same proportion. During the summer of 1918 it became a matter of great importance that these officers be given intensive training and instruction. Therefore, the Surgeon General sent out another circular letter of instruction, calling attention to the above facts and citing Special Regulations, No. 49a, War Department 1917, and previous letters of instruction as a basis upon which intensive instruction was to be placed.⁵

While the divisions were undergoing organization and training for overseas service in the cantonments in the United States during the early months of our participation in the war, the division surgeon exercised the function of camp surgeon as well as that of division surgeon, and was responsible for the training of all sanitary troops in the camp in accordance with the training plans formulated under the direction of the Surgeon General, except those assigned to the camp base hospitals. It was the intention of the Surgeon General, however, in the issuance of circular letter of instruction on October 3, 1917,⁴

to all division surgeons, and the circular letter to the commanding officers of all base and general hospitals, on November 1, 1917,⁶ that the instruction in the cantonments be correlated in such a way that the professional training of all officers in the camps be conducted by the specialists assigned to base hospitals, each one of whom, as a rule, was eminently qualified to give this instruction in his particular branch of medicine, and that the military instruction of all sanitary personnel be given by officers assigned to the field units of the camp. It was also intended that enlisted men from the divisional units be assigned to the base hospitals for training in nursing, ward management, the duties of operating room, orderlies, etc., and in the majority of the camps this was accomplished, especially during the latter part of the war.

When the division surgeon acted also as the camp surgeon, on the departure of the divisions for overseas service, the camps were often left without an organized camp surgeon's office, or without either commissioned or enlisted personnel commensurate with the needs of the camps, and often the division surgeon took away with him all records pertaining to the camp.⁷ In order to correct this condition and to correlate the activities of the various units, the Surgeon General decided to assign camp surgeons and the necessary sanitary personnel to all camps, to complete the organization of a camp surgeon's office, and the division surgeons were notified that in case this had not been accomplished they should take steps to select the necessary personnel from the officers and enlisted men who were to remain, to complete such an organization and to instruct them in their duties before the departure of the division, or that in the event the necessary personnel was not available, to make telegraphic request to the Surgeon General for them.⁷ The following scheme for the organization of Medical Department activities of a large camp, which had been developed at one of our large camps, was thought so well of by the Surgeon General that, on May 27, 1918, it was promulgated by him in memorandum form to all camp surgeons, to be used as a guide in organizing the camp surgeon's office.⁸

1. The attached scheme for the organization of Medical Department activities at a large camp is furnished for your information. This plan received the highest commendation from the commanding general of the camp in question and appears to cover in an exceptionally complete manner the various functions of the Medical Department. It is not intended that this plan should necessarily be adopted as a standard, but it is desired that you give it careful study with a view to correcting any defects which you may find in your camp organization.

HEADQUARTERS CAMP BLANK,
OFFICE OF THE CAMP SURGEON,
May 10, 1918.

From: The Camp Surgeon.

To: The Adjutant General of the Army, Washington, D. C. (through the commandant Camp Blank).

Subject: Organization of the medical department of a camp.

1. The various activities of the Medical Department at a large receiving camp, such as Camp Blank, have been left, as far as the Tables of Organization are concerned, to each camp surgeon to work out as he sees fit.

2. A camp, such as Blank, is permanent in its character, and it is suggested that a medical officer of at least the rank of colonel be assigned permanently as camp surgeon to coordinate the work of the different divisions and the depot brigade. He should have a permanent staff, both commissioned and enlisted, and the sanitation of the entire camp should be directly under his supervision.

3. The organization of the medical department of the division is fully covered by the Tables of Organization.

4. The depot brigade is a permanent organization, and its activities are so varied that it is believed that a complete and coordinated medical organization should be prescribed. This should be permanent, and should be sufficiently elastic to meet the many emergencies which may arise in the brigade.

5. As at present organized in this camp, the medical activities consist of seven different services and embody seven special boards, as follows:

(a) Services:

- (1) Examination of recruits.
- (2) Remedial defects.
- (3) Venereal.
- (4) Detention camp.
- (5) Quarantine camp.
- (6) Infirmaries.
- (7) Dental.

(b) Special boards:

- (1) Tubercular.
- (2) Neuropsychiatric.
- (3) Eye and ear.
- (4) Orthopedic.
- (6) Genitourinary.
- (7) Psychological.

6. The examination service has assigned to it 9 commissioned officers, and during the periods when men are being received the special boards work in conjunction with this service.

7. The remedial defects service has 5 commissioned officers assigned to it, whose duties are to prescribe drill and exercise to develop defectives, supervise their work, and make recommendations as to the suitable final disposition of these men. The special boards also act as consultants for the various classes of defects coming under their specialties.

8. There are 6 to 8 officers assigned to the detention camp, who act as camp surgeons, complete inoculations and vaccinations, and complete the medical records of the men. While in this camp, an orthopedic survey is made of the men, and corrective drill is instituted where necessary.

9. At the quarantine camp 6 officers are assigned, who act as camp surgeons, treat meningitis carriers, diphtheria carriers, and perform the various duties necessary to the health of the various contacts.

10. The venereal service has three officers assigned to it. This service treats all cases of syphilis and supervises the treatment of all cases of gonorrhea in camp. The service keeps the necessary records. This service is very important, as is evidenced by the fact that from 3 to 5 per cent of all drafted men have venereal disease when received.

11. The infirmary service comprises the battalion medical service, 2 officers being assigned each training battalion (Tables of Organization). This personnel may be cut considerably if this proposed organization is adopted, 3 battalions being served at 1 infirmary and 3 medical officers assigned to each infirmary.

12. The dental service has 11 dental surgeons assigned, with a completely equipped dental infirmary.

13. The various boards examine men when received and act as consultants in their specialties.

14. It has been found that this organization fulfills all the requirements of the depot brigade and is able to handle the work in an efficient manner. It is therefore recommended that the following Medical Department organizations be prescribed for National Army camps:

- 1 colonel, camp surgeon.
- 1 major, assistant to camp surgeon.
- 1 captain, assistant to camp surgeon.
- 1 major, sanitary inspector.
- 8 captains or first lieutenants, assistants to sanitary inspector.
- 1 lieutenant colonel, surgeon, depot brigade.
- 1 captain, assistant to surgeon.
- Examination service:
 - 1 major.
 - 8 captains or first lieutenants.
- Remediable defects battalion:
 - 1 major.
 - 4 captains or first lieutenants.
- Venereal service:
 - 1 major.
 - 2 captains or first lieutenants.
- Detention camp service:
 - 1 major.
 - 5 to 7 captains or first lieutenants.
- Infirmaries:
 - 1 captain or first lieutenant to each training battalion.
- Dental service:
 - 1 major.
 - 10 captains or first lieutenants.

Special boards:

Tubercular—

1 major.

4 captains or first lieutenants.

Cardiovascular—

1 major.

2 captains or first lieutenants.

Neuropsychiatric—

1 major.

4 captains or first lieutenants.

Eye and ear—

2 captains.

Orthopedic—

1 major.

2 captains or first lieutenants.

Psychological—

2 captains or first lieutenants.

15. This organization calls for 73 to 82 medical officers, according to the number of battalions; 11 dental and 2 Sanitary Corps officers.

GENERAL TRAINING FOR MEDICAL OFFICERS

In general, the principle underlying training of medical officers of tactical divisions was the same for all: (a) Basic military training; (b) special training, so as to permit an officer of the Medical Department to function; (c) training to develop organization efficiency.

The training of officers was made as practical as possible, the intention being to instill discipline, to enhance the ability to command, and to develop qualities of leadership and morale. Medical officers who reported without previous military training were ordered to drill in ranks, under the direction of those who had received basic training in medical training camp, in order that they might learn rapidly and acquire ability to execute drill movements. As soon as they proved themselves, they were given command. The character of the training of officers was varied. Calisthenics, sick call, sanitary inspections, field work, classroom work, and lectures were a part of each day's schedule.

Division surgeons kept in close contact with the units by frequent conference with all medical officers in order that developing problems might be solved and uniformity in training attained so as to insure proper coordination in the function of regimental detachments with the units of sanitary trains. Officers were given detailed theoretical and practical instruction in the methods of sanitary control, a complete sanitary inspection of every unit area being made each day by the medical officer selected, who made a report and recommendations to the division surgeon. Lectures were conducted 10 hours a week in some divisions (at night) where courses in Army Regulations, organization, tactics, and technique of the Medical Department, administration and sanitary tactics were developed. Papers on medico-military subjects of special importance with relation to war were read, analyzed, and discussed.

Without warning, regimental detachments or units of the sanitary train were called out and required to march with full impedimenta and to establish their stations at points designated on maps by the division surgeon. Drill schedules were outlined by the senior medical officer, and subordinates were made responsible for the execution of them. Medical officers were required to make themselves proficient in all forms of Medical Department drill, and later to operate their detachments on the field under as nearly actual conditions as they would exist in combat. They were instructed in trench warfare, approach of trenches, approved methods of evacuating the wounded in conjunction with ambulance dressing stations and field hospitals. The following is an example of a schedule of instruction for the medical officers of a division:⁹

Schedule of training for officers, Medical Department

	Thursday, Nov. 1	Friday, Nov. 2	Saturday, Nov. 3	Monday, Nov. 5	Tuesday, Nov. 6	Wednesday, Nov. 7	Thursday, Nov. 8	Friday, Nov. 9

SPECIAL TRAINING FOR OFFICERS

Instruction of medical officers of the divisions in the professional branches was generally received in the regular courses of lectures, clinics, and conferences carried out in the cantonment base hospitals as directed by the Surgeon General for all medical officers of the camps.

IN ORTHOPEDIC SURGERY

Instruction in orthopedic surgery and the care of the feet was carried out in divisions in compliance with directions from the Surgeon General. This instruction was not confined to the personnel of the division while it was in process of organization and training in cantonments, but included the training of all personnel in the camp, including that in base hospitals. The following is an example of a plan for instruction of division personnel by the division orthopedic surgeon, in compliance with War Department General Orders, No. 133, dated October 11, 1917: Medical officers were divided into two or three groups by the division surgeon, each group being given three lectures. As there were between 50 and 75 medical officers in a division, this instruction was readily and quickly accomplished, usually in connection with the division school. It is important to remember in this connection that the orthopedic surgeon was endeavoring to instruct general practitioners, and all material given them was of the simplest, plainest, and most practical character; all technical language and matters were eliminated from the lectures.

IN GAS DEFENSE

A school of gas defense was established in each divisional camp or cantonment in the United States. The director of this school was a medical officer, who had as assistants one chemist and one noncommissioned officer of the Medical Department. All officers and enlisted men in the divisions and camps were required to take the course of instruction in these schools.¹⁰

On February 27, 1918, gas defense training activities were transferred to the Engineer Corps,¹¹ and in April, 1918, the Adjutant General ordered the relief of all Medical Corps division gas officers and their replacement by Sanitary Corps officers who had been transferred to the Engineer Corps.¹²

TRAINING FOR ENLISTED PERSONNEL

From the first physical training was given priority on the schedule of instruction of enlisted men, special attention being given to exercises intended to test and develop alertness and attention to orders. Training was made progressive, beginning with physical exercises accompanied by instruction in school of the soldier, military courtesy and bearing, elaborated to the development of the individual's ability to function in the tactical operation of regimental detachments and units of the sanitary trains.

Independent maneuvers were conducted which developed the operation of all units of the Medical Department serving with the division. Medical detachments were required to participate in regimental parades and all other regimental ceremonies. Reveille and retreat formations were made a part of the daily routine, complete inspections being made as to general appearance, equipment, and soldierly bearing.

In many of the divisions, at least twice or three times a week, all divisional medical units were trained on a common drill ground. By this action the comparative progress of the units of the divisional sanitary service could be observed, and training could be modified or elaborated so as to assure knowledge of the operation of the combined units of the Medical Department and coordination of action. In addition, detachments accompanied their respective line organizations to the training field, where they carried out the prescribed schedule of instruction, rest periods being given over to instruction in first aid, venereal diseases, and personal hygiene.

When units of the divisions occupied the trenches for special instruction, the medical detachment attached thereto accompanied them, to establish aid stations and conduct training simulating trench warfare conditions.

In general there developed basic and special individual instruction which was elaborated into definitive training in the function of units of the sanitary service with organizations. This scheme as a whole was based on the intensive instruction of the individual followed by the application of the individual knowledge in the development of organization efficiency, so as to evolve thoroughly trained and coordinated sanitary services with divisions.

The following outline¹¹ and schedule¹⁴ are given as an example of the instruction carried out for the enlisted men by a division during the fall and winter of 1917-18.

OUTLINE OF BASIC INSTRUCTION FOR ENLISTED PERSONNEL AND SUBJECTS COVERED

ANATOMY AND PHYSIOLOGY

I. THE SKELETON AND JOINTS

Give strength and form; protect organs; joints permit motion.

(a) BONE (discuss the subheads briefly):

Composition.—One-third animal (gelatin); two-thirds mineral (lime); animal—toughness and elasticity; mineral—hardness.

Periosteum.—Bone covering; vascular membrane; provides nourishment; when stripped off, bone dies.

Cartilage or gristle.—Elastic substance; ends of long bones; ribs to breast bone.

Classification.—Long; short; flat; irregular, long bones, system of levers, support weight, provide locomotion; short bones, strength and limited motion; flat bones, skull, protection; irregular bones, pelvis.

Vertebral column or spine.—Buffers or pads of elastic cartilage; distribute shock; 7 cervical; 12 dorsal; 5 lumbar; 5 sacral; 4 coccyx; bony canal—contains spinal cord.

Pelvis.—Sacrum; coccyx; innominate bones, contents of.

(Four hours.)

(b) JOINTS (discuss the subheads briefly):

Synovial membrane.—Description of.

Ligaments.—Description of.

Classification of joints.—Ball-and-socket; hinge; sutures.

Dislocation.—Slipping away of joint surfaces from each other, so that they may remain out of place.

Hip joint.—Pelvis; femur.

Knee joint.—Femur; tibia; patella.

Entire bone system.—Tibia; fibula; ankle joint; tarsus; metatarsus; phalanges; ribs, 7 true, 5 false, 2 floating; breast bone or sternum; clavicle; scapula; shoulder joint; humerus; elbow joint; radius; ulna; carpus; metacarpus; phalanges; skull; number and location of permanent teeth.

(Four hours.)

II. THE MUSCLES, CELLULAR TISSUE, AND THE SKIN

(a) **MUSCLES** (discuss the subheads briefly):

Function.—To contract and thereby move the various parts and tissues of the body.
(Reason for splints on fracture.) Differentiate between contraction and retraction.

Kinds.—Voluntary; involuntary.

Actions or movements.—Flexion; extension; pronation; supination.

Rigor mortis.—Change in muscles by which they become rigid.

(Two hours.)

(b) **CELLULAR TISSUE** (discuss the subheads briefly):

Fat.—Is the padding.

Structure.—Connective tissue spongy.

(One hour.)

(c) **SKIN**.—Tough elastic membrane covering the entire body; sweat glands; sebaceous glands; purpose.

(One hour.)

III. THE NERVOUS SYSTEM AND SPECIAL SENSES

(a) **NERVOUS SYSTEM** (discuss the subheads briefly); sympathetic system:

Parts.—Brain; spinal cord; nerves; also have sympathetic system.

Brain.—Location; divisions of.

Spinal cord.—Location; functions.

Nerves.—Sensory; motor.

Special senses.—Touch; taste; smell; hearing; sight; the organs which accomplish same.

(Two hours.)

IV. THE DIGESTIVE APPARATUS

(a) **FOODS**:

Foods.—Proteids; fats; starches and sugars; minerals.

Proteids.—Muscle builder; blood builder; give force and heat.

Starches and sugars.—Convertible into heat and work; make fat.

Minerals.—Water is a solvent; salts; bone.

(One hour.)

(b) **DIGESTIVE APPARATUS**:

Mouth.—Mastication of food; mixing with saliva; no digestion except slight conversion of starch into sugar; saliva comes from salivary glands; parotid; submaxillary; sublingual; mumps.

Pharynx and esophagus.—For swallowing and conveying food to stomach.

Stomach.—Muscular bag; opens into small intestine.

Small intestine.—Five feet in length.

Vermiform appendix.

Rectum.

Anus.

(Two hours.)

(c) **OMENTUM**:

Umbilicus.—Location of; what for.

Gall bladder.—Location of; what for.

Gall.—What is it?

Sweetbread or pancreas.

Liver.—Function.

Spleen.—Function.

(One hour.)

V. THE BLOOD AND THE CIRCULATORY SYSTEM

(a) **LYMPHATIC AND BLOOD VESSEL SYSTEM**:

Lymph glands.—Inguinal; epitrochlear; post cervical.

Blood and blood vessels.—Functions, receive from lungs and alimentary tract, carry to the body materials for nutrition, temperature and moisture, carry away waste or poisonous matters; appearance and composition, red, bright red in arteries, dark red in veins, cells, liquor sanguinis.

(Three hours.)

Heart.—Cavities; arteries; capillaries; veins (draw a schematic diagram of blood circulation); aorta; innominate; left common carotid; left subclavian; carotid and right subclavian; brachial; radial; ulnar; common iliac; internal and external iliac; popliteal; anterior and posterior tibial (illustrate by showing where to make pressure for hemorrhages). (Three hours.)

VI. THE RESPIRATORY APPARATUS

RESPIRATORY APPARATUS.—Larynx or Adam's apple; epiglottis; trachea or windpipe; right and left bronchus; lungs; air cells; respiration; inspiration; expirational necessity of ventilation; sweat or perspiration.

(Two hours.)

VII. THE EXCRETORY APPARATUS

URINARY APPARATUS.—Kidneys; ureters; bladder; urethra.

(One hour.)

FIRST AID

I. EMERGENCIES, CONTUSIONS AND WOUNDS

(a) EMERGENCIES.—Bleeding; shock; wounds; fractures.

(b) CONTUSIONS.—"Subcutaneous wound"; symptoms; treatment; shock, symptoms and treatment.

(Eight hours.)

(c) WOUNDS.—Division of skin and tissue; classes, incised, lacerated, contused, punctured, poisoned, gunshot wounds; granulation; suppuration; inflammation; septic infection; treatment, arrest hemorrhage, relieve shock, prevent infection (first-aid packet); local wounds of skull, chest, abdomen, bladder; poisoned wounds; bites; rabies; tetanus; anthrax; poisoned arrows.

(Eight hours.)

The close contact of well constructed and protected opposing trenches, the development of the hand grenade, bomb, high-explosive shell, shrapnel, machine gun, and asphyxiating gas have all combined to greatly limit the usefulness of the rifle.

The use of the bayonet in carrying a position has been a weighty factor during the operations of the present war. The French bayonet, which is triangular on cross section, needle-pointed, fluted, and with one or more cutting edges, is considerably longer than any of the other bayonets. The English bayonet and that of the continental armies is a knife bayonet, which takes the form of their respective hunting knives.

Rifle balls.—There are a number of factors which have a bearing upon the character of the wound inflicted by the cylindro-ogival rifle ball, of which the German ball S is a type. If the soft parts only are involved, the wound of entrance and channel are of the same size as the undeformed bullet. At close range the wound of exit is larger. This is due to the inability of the tissues to spread or separate quickly enough to allow the high-velocity bullet to make a channel without pushing some of the tissue it traverses ahead of it, and only when compact bone is in its path does it cause comminution, and the smaller bony fragments act as secondary missiles.

Grenades.—They may be thrown by the hand or rifle. The German grenade is composed of a copped rod, to the extremity of which is fixed a cast-iron cylinder filled with a high explosive and grooved in order to facilitate breaking. It usually fires by percussion. By hand it is used for short distances; with the rifle it has a maximum range of 400 meters. Grenade wounds, besides the usual great destructive effects, are always infected wounds. The "minenwerfer," or trench mortar, first introduced by the Germans in the early fighting around Ypres, is another means of hurling a large amount of high explosive into an opposing trench. It throws a shell of about 180 pounds a distance of 350 yards.

The machine gun.—There is no difference in the actual effect of a ball from these and from the rifle.

Shrapnel.—Is being used less and less, the high-explosive shell being considered much more effective, both on account of effectively sweeping a larger area and on account of the fact that in the vicinity of the explosion air vibrations alone are sufficient to cause instant

death. The death from these shells, without any apparent wounds, has remained a mystery. It is probably due to the fact that in the immediate vicinity of the explosions there is a sudden atmospheric depression to the extent of about 350 millimeters of the mercury tube, corresponding to a dynamic pressure of about 10 tons to the square yard. The men exposed to this violent change meet with conditions similar to the men who leave compressed air chambers without taking the proper precautions, the effect being to liberate nitrogen suspended in the blood and to transform it into bubbles of gas. These are transferred by the action of the heart into the capillary vessels, stopping the circulation of the blood in the vital centers and causing instant death. On the other hand, some of the causes of these deaths, without apparent wounds, may be due to the blow the body receives from the primary violent air impact delivered as a blow over one side of the body and especially over the heart, causing reflex actions that register themselves with a fatal effect.

II. HEMORRHAGES

- (a) CAPILLARY HEMORRHAGE.—Treatment; nose bleed.
- (b) VENOUS HEMORRHAGE.—Treatment.
- (c) ARTERIAL HEMORRHAGE.—Character; treatment; points of pressure for different arteries; tourniquet; pads; bleeding from lungs, stomach, bowels—symptoms. Treatment—absolute quiet, cold applications.

III. DISLOCATIONS AND SPRAINS

- (a) DISLOCATIONS.—Definition “out of joint”; ligaments torn; cause; symptoms—deformity, shortening of limb, lack of movement (unnatural movement in fractures). Treatment—reduction, support. Special dislocations—shoulder, anterior and posterior dislocations of the thigh; symptoms, treatment, Kocher’s method, after-treatment; jaw, symptoms, treatment, after-treatment; finger joints, treatment; patella, symptoms, treatment.

(Two hours.)

- (b) SPRAINS.—Nature; symptoms; treatment; special sprain—ankle, symptoms, treatment, hot water, cleanse and strap, bandage, shoe, walking, massage.

IV. FRACTURES

- (a) FRACTURES.—Definition; classification—simple compound, comminuted, complicated, green stick; symptoms—loss of power, unnatural movement, crepitus, pain, swelling; treatment—put parts in place, hold them still with splints; setting; extension and counter-extension; bandages (not too tight), splints; purpose, kinds, extemporized splints; padding; support; “knitting” of bones. Effects of too tight bandaging on splints.

(Two hours.)

(b) SPECIAL FRACTURES:

- Skull*.—Cranium, base, special symptoms; special treatment.
- Spinal column*.—Special symptoms; special treatment.
- Ribs*.—Special symptoms; special treatment.
- Pelvis*.—Special symptoms; special treatment.
- Nose*.—Special symptoms; special treatment.
- Mandible*.—Special symptoms; special treatment.
- Clavicle*.—Special symptoms, attitude, special treatment, pad in axilla, Sayre’s strapping or Velpeau bandages.
- Humerus*.—Special symptoms; special treatment; slings, sling.
- Forearm*.—Special symptoms, special treatment, position of arm, splints, radius (Colles’s fracture), symptoms, put in sling, leave for surgeon.
- Metacarpals and fingers*.—Splints, bandage.
- Femur*.—Special symptoms—eversion, shortening, special treatment—setting, extension, counter-extension, splints and padding, method of application, splints tied in 5 places, tie legs together.
- Patella*.—Special symptoms; special treatment—splints, figure-of-eight bandages.
- Leg*.—Both bones, special treatment—splints.

Leg.—Both bones, special treatment—splints, tie legs together; fibula, Pott's fracture, special treatment—splints (2); tie legs together.

Foot.—Plaster of Paris dressing.

(Eight hours.)

V. FOREIGN BODIES

In the eye.—Eversion of lids, removal of object, use of burned match.

In the ear.—Animal or mineral, water and syringe; vegetable, use wire, keep end of it in sight; wax, use soda solution and syringe, alcohol and boric acid to dehydrate.

In the nose.—Treatment; maggots, treatment—chloroform followed by syringing with warm salt solution.

In the throat.—Use forceps or dry bread or induce vomiting.

In the air passages.—Mention tracheoscopy.

In the stomach.—Mention esophagoscope. Open operation; use of X ray.

In the skin.—Splinters; needles, fishhooks; gunpowder.

(One hour.)

VI. EFFECTS OF HEAT AND COLD

(a) HEAT:

Heat stroke.—Cause, contributing factors, symptoms, treatment, effects.

Heat exhaustion.—Symptoms, treatment.

Burns.—Degrees—first, redness; second, blisters; third, charring; symptoms—shock, chill, pain; dangers from burns of first, second, and third degrees; open treatment, paraffin wax R; treatment of first degree—soda, oil; of second and third degree—protection from air, prevention from infection, relief from shock, care of blisters; general treatment.

In the present war, flame projectors are used for throwing burning liquids or gases. The effective range is about 30 meters. The burns caused by this method are of the deep, sloughing variety, exposing tendons and bones, and are treated with wet dressings until healthy granulations appear. These flame projectors are mainly employed in street and house-to-house fighting, although they have been used in the trenches.

Burns from acids.—Treatment.

Burns from alkalis.—Treatment.

Clothing on fire.—Action to be taken.

(Four hours.)

(b) COLD:

Freezing.—Local effects; general effects; treatment—rubbing with cold cloths in cold room, artificial respiration, warm drinks when the patient can swallow.

Frost bite.—Nature; symptoms; danger; treatment.

Chilblain.—Nature, cause; symptoms; treatment; prevention—woolen socks.

(Four hours.)

VII. INSENSIBILITY

(a) *FAINTING.*—Cause—mental; contributing causes—bleeding; exhaustion; symptoms—skin, face, pupils, breathing; treatment—position clothing, stimulants.

(b) *SHOCK.*—Cause—physical; symptoms—skin, face, pupils, breathing, pulse, temperature; injuries causing it; treatment—local, stop hemorrhage, general warmth.

(Four hours.)

(c) *CONCUSSION OF BRAIN.*—Cause; nature; symptoms—mental, pupils, breathing, pulse, treatment—rest, warmth, ammonia.

(d) *COMPRESSION OF BRAIN.*—Cause; nature; apoplexy; some paralysis; treatment raise bone, stop bleeding.

(One hour.)

(e) *LIGHTNING STROKE.*—Effects; treatment—artificial respiration, symptomatic treatment. Electric shock—break the circuit, using dry clothes, stick or rope; treat as for lightning.

(f) *ACUTE ALCOHOLISM.*—Symptoms—mental, face, eyes, pupils, temperature, breathing, pulse, no paralysis (distinguish from apoplexy); treatment—induce vomiting, cold to head, warmth to body, warm drinks, sleep. Very important to distinguish from skull fracture.

(g) **EPILEPSY**.—Severe type; symptoms—cry, fall without knowing that he is falling, rigidity, convulsions, stupor, sleep, pupils, tongue, bladder, bowels, no paralysis; treatment—protect tongue by twisted handkerchief in mouth; feigned epilepsy; note time of occurrence, tongue not hurt in falling, pupils normal, eyeballs sensitive, soap in mouth, pail of water thrown on patient helps distinguish.

(One hour.)

(h) **UREMIC COMA**.—Distinguish from skull fracture.

(i) **OPIUM POISONING**.—Symptoms—mental, pupils, breathing, (8–10) pulse; treatment—induce vomiting, permanganate of potassium, coffee, pain, movement to prevent sleep.

(One-quarter hour.)

VIII. ASPHYXIA

ASPHYXIA.—Definition; modes of occurrence; treatment—removal of the cause, artificial respiration (Shafer's method) (have the class do it properly). Drowning; treatment—get rid of the water, artificial respiration, restore heat, stimulate circulation, prevent complications. (NOTE.—Only Schafer's method of artificial respiration correctly done will be used.)

(One-half hour.)

IX. POISONING

(a) POISONS TAKEN INTERNALLY:

General treatment.—Empty stomach; emetics—warm water, salt, mustard, tickle throat, wash stomach; antidotes given immediately after emetic—general, tea, milk, special, taken up later on; relieve pain—oils, milk, morphine; counteract lethal tendency—shock, stimulants, warmth, rubbing; failing heart—hot coffee, strychnine; failing respiration—coffee, cold douche, artificial respiration; convulsions—chloroform, bromides.

Summary.—If you do not know what poison: (1) If lips and mouth are burned, no emetics, olive oil, rest, morphine, mustard plaster over stomach, counteract symptoms. (2) If lips and mouth are not burned, emetic, three raw eggs, milk or flour and water, hot tea; rest, counteract symptoms. If you know the poison, emetic, appropriate antidote, relieve pain, counteract symptoms. (3) A good antidote, when in doubt, is Haines Universal Antidote, equal parts of heavy calcined magnesium oxide, animal charcoal, tannic acid. Keeps well when dry for a long time.

Classification.—Caustics: Symptoms—primary effects, remote effects; burns on lips, pain, bloody vomit, with shreds of stomach lining; treatment—no emetic, neutralize poison, acids or alkalis, protect mucosa by oils, milk, relieve pain, carbolic acid.

Irritants of alimentary canal: Arsenic, corrosive sublimate, etc. Primary and remote effects.

Neurotoxic, acting primarily on the central nervous system: Opium, strychnine, belladonna, atropine, phosphorus: primary and remote effects.

Asphyxiating gas, chlorine, or bromine gas, compressed to liquid form and liberated from large metal tanks when the wind is blowing toward an opposing trench, has caused very distressing deaths when inhaled in concentrated form. Being heavy gasses, they hug the ground, moving to leeward, and sink into the trenches, there causing a violent irritation of the bronchial tract, with a hypersecretion of a thin water mucus which fills up the air spaces of the lungs and practically causes death from drowning. The protection from this is the prophylaxis in the form of a protector helmet, with a solution of hyposulphite and bicarbonate of sodium. The only form of gas which the present British masks will not protect from is the poisonous carbon-monoxide. This is an active poison, and when it is inhaled it unites with the hemoglobin of the blood.

(Four hours).

Special poisons.—Carbolic acid; symptoms; treatment—sulphates, albumen, emetics; teach men that one emetic nearly always available when no others are at hand and almost always effective is tepid (not hot or cold) dish water; artificial respiration, warmth, rubbing.

Opium; symptoms; after effects; treatment—emetic, permanganate of potassium, coffee, prevent sleep.

Wood alcohol; symptoms; after effects; treatment—emetics, enema, strychnine, artificial respiration, warmth.

Ptomaines; nature, symptoms; treatment—emetics, cathartics, relieve pain, stimulants, warmth. Etiology—nearly always bacteriological.

Chloral—"knockout drops"; symptoms; treatment—emetics, strychnine, coffee, rest, prevent sleep.

Arsenic—"Paris green"; symptoms; treatment—emetics, freshly prepared iron hydrate (tincture of iron and dilute ammonia), morphine, warmth, rubbing, magnesium oxide.

Corrosive sublimate; symptoms; treatment—three raw eggs or milk, emetics later, morphine, bland drinks, warmth, rubbing.

Silver nitrate; treatment—salt and water, tickle throat.

Phosphorus (matches); antidote—potassium permanganate solution may be used.

Strychnine; symptoms; treatment—emetics, chloroform or bromides.

(Two hours.)

(b) EXTERNAL POISONS:

Special poisoning.

Poison ivy.—Three leaflets, hairy stem, white berries; symptoms; treatment—wash with alcohol, later with soda solution.

Poison oak.—Three leaflets notched, downy under surface; symptoms; treatment—wash with alcohol, later with soda solution.

Poison sumach.—White berries (ordinary sumach has red berries); symptoms; treatment—wash with alcohol, later with soda solution.

Snake bite.—Nature of venom, treatment, etc.

(One hour.)

NURSING

I. EXTERNAL POISONS

(As each is taken up, give examples of where they are used)

(a) HEAT.—(1) Dry heat—means, method of using, precautions. (2) Moist heat—poultices, methods of making and application; fomentations or stupes, methods of application; sweat tent. Method of testing temperature.

(b) COLD:

Compresses.—Method of making and application.

Ice bag.—Method of making and application.

Ice water coils.—Method of making and application.

(c) LOTIONS, MEDICATED (two hours).

(d) COUNTERIRRITANTS.—Indications and use:

Rubefacients.—Mustard plaster—method of making and application (no hot water or vinegar); turpentine stupes; iodine; liniments and massage; cupping dry and wet.

Blisters.—Cantharides, collodion, or plaster—method of application, chloroform or ammonia covered; actual cautery use.

Caustics.—Silver nitrate—before using, clean on wet lint. Copper sulphate—for application to eyelids, rub crystal on fine stone to produce fine point. Nitric acid—method of application; used for disinfecting chancreoids.

(Two hours.)

II. TEMPERATURE, PULSE, RESPIRATION

(a) TEMPERATURE.—Different at different times; limits.

Normal.—Method of taking—thermometer, self-registering maximum, Fahrenheit scale, method of standardizing; method of use.

Subnormal.—Cause.

Fever.—Danger point; moderate; high; very high; continued; remittent; intermittent. Fever charts.

(One hour.)

(b) PULSE.—Method of feeling; normal pulse—frequency, regularity, fullness, tension, strength, intermittence; effect of—food excitement, etc.; irritable; dirotic; intermittent (one hour).

(c) **RESPIRATION.**—Method of taking without knowledge of patient; normal rate; frequency; regularity; easy or difficult; quiet or noisy; deep or shallow; symmetrical. Slow and shallow in narcotic poisoning, etc. Rapid in pneumonia, peritonitis, etc. Cheyne-Stokes respiration; nature; occurs in heart and kidneys disease. "The lamp tends to flicker when going out." Stertorous breathing. Dyspnea. Relation of pulse, temperature and respiration (one hour).

III. BANDAGING

(a) **TRIANGULAR BANDAGE.**—Application.

(b) **ROLLER BANDAGES.**—Material sizes; preparation.

Rules for use.—(1) Limb in position it is to occupy; (2) begin at extremity of limb; (3) put a layer of cotton between opposed skin surfaces; (4) hold the roller in right hand to bind the left limb, and vice versa; (5) place the outer surface of bandage on inner side of limb and secure by two circular turns; (6) bandage evenly. Do not bandage too tight. (If the blood when pressed out from under nails does not promptly return, the bandage is too tight.)

Circular turns.—Spirals; reverses; figures-of-eight; spica; knotted turn.

Special application of roller bandages.—(1) Recurrent of head or stump; (2) figure-of-eight, of eye or jaw; (3) spiral of chest; (4) Velpeau for fractured clavicle; (5) finger bandages; (6) foot bandages.

(c) **TAILED BANDAGES.**

(d) **T BANDAGES.**

(e) **STERILE GAUZE BANDAGE.**

(f) **FLANNEL BANDAGE.**

(g) **RUBBER BANDAGES.**—Care; method of washing; method of application; use as a tourniquet.

(h) **PLASTER OF PARIS BANDAGE.**—Method of preparing; method of applying (strip of tin); method of removing.

(Two hours.)

HYGIENE

I. INFECTIOUS DISEASES

(Brief, general discussion of the bacteria. Avoid symptoms of diseases)

Typhoid fever.—Cause; dissemination—infected foods, polluted liquids, fecal matter and urine infection; always present in person of carriers (proportion of 1 to 1,000 in mobilization camps); contact infection—milk, food, flies (direct carriers and through fecal matter); prophylaxis, immunization; segregation; urine tubs.

Paratyphoid fever.—Take up under same heading as typhoid.

Diarrhea and dysentery.—Fifty-seven thousand two hundred and sixty-five deaths in the Federal armies; simple diarrhea, fermentative or putrefactive; amoebic dysentery; bacillary dysentery.

Cholera.—Method of transmission; prophylaxis (four hours).

Tuberculosis.—Everyone infected in childhood; acquired immunity; activity caused by breaking down of resistive power; mode of infection; prophylaxis—fresh air.

Pneumonia.—Avoid vitiated air. Best precaution good ventilation (two hours).

Malaria.—Results only from mosquito-bite method of infection—salivary glands; prophylaxis; destruction of mosquitoes; protection against bites; isolation and protection of malarial patients; medical prophylaxis.

Yellow fever.—Mosquito; prophylaxis.

Dengue.—Break-bone fever; mosquito (two hours).

Typhus fever.—Body louse—in clothing, not on person. Plague; *Pulex cheopis*—rat flea (two hours).

Spinal meningitis.—Transmission; prophylaxis (two hours).

Smallpox.—Transmission; prophylaxis.

Scarlet fever.—Transmission; prophylaxis.

Measles.—Transmission; prophylaxis.

Mumps.—Transmission; prophylaxis (two hours).

Tetanus or lockjaw.—Frequency in Europe; injections in first-aid stations of all wounded; transmission; prophylaxis.

Gas gangrene.—Frequency; cause; prophylaxis (four hours).

Bubonic plague.—Rat; rat flea.

Intestinal parasites.—Brief discussion of teniacycle and prophylaxis.

Skin parasites.—Barbers' itch; dhobie itch (two hours).

Relation of insects to infection.—Flies, fleas, mosquitoes, lice, ticks (two hours).

II. DISEASES CAUSED BY IMMORAL OR INTEMPERATE HABITS

Veneral diseases.—Gonorrhea; syphilis—stages of, with brief talk of remote effects; chancroid; transmission. Prophylaxis: (1) Moral teaching, the fundamental teaching of all home and school education; (2) sexual intercourse is not necessary to attain the best physical and mental health and that a strong manly character is developed only by self-control and continence. Appreciation of the prevalence and gravity of venereal diseases is essential. One-third of all prostitutes are suffering from some form of them in the infectious stage. Thirty-three per cent of all syphilitics eventually die of tuberculosis, paralysis, or aortic aneurysm. (Explain terms used.) The sinister predilection of tertiary syphilis for the nervous system is well known. Avoid thoughtless exposure; a few days in the hospital will not suffice to cure the disease. Syphilis affects not only the incontinent, but through matrimony many innocent women and children. Speak of the far-reaching effects on female genital organs. (3) All efforts to abolish prostitution have been futile. The strong hand of the military should be exerted to protect camps and garrisoned cities. (4) The life of the soldier in the garrison and camp should be made as attractive as possible. Post exchange with recreation features should be provided. (5) Systematic physical inspection of the men. Men found suffering from some venereal disease should be treated and strictly confined to their post. (6) Men contracting any form of disease after sexual intercourse should report as soon as first symptoms manifest themselves, so that they can be treated before complications arise. (7) Personal prophylaxis is not only advisable but also desirable, inasmuch as the influence of fear is a factor of slight importance in deterring.

Place special stress on (1) moral aspects, (2) continence, (3) venereal prophylaxis, (a) reasons for, (b) how it prevents, (c) time limit for use (six hours).

III. PERSONAL HYGIENE

Bathe and wash the skin.—(1) To promote and stimulate its functions; discuss. (2) To remove dirt and prevent the breeding of germs on its surface. (3) To prevent the fouling of the air by emanations; discuss. (4) For the tonic stimulating effects which cold water produces.

Daily toilet.—Wash face, neck, head, and hands and arms each morning. Do not use soap on the scalp more than twice weekly. Wash hands whenever soiled, before meals. Use neutral soap; explain. The teeth demand special attention. Nostrils. Ears. Hair. Feet, wash daily on the march. Drinking cup, danger of common cup. Baths at least twice weekly. Must wash hands after each visit to the latrine (four hours).

IV. WATER

Rain, river, lake, and spring. Hard and soft water—what is meant.

V. WATER PURIFICATION

Heat; chloride of lime; water filtration; calcium (or sodium) hypochlorite (1 hour).

VI. FIELD COOKING AND BAKING

The lecture will be illustrated by the preparation of one of several components of the rations on the field range (four hours).

VII. CLOTHING AND UNIFORM

Permeability—discuss; hygroscopicity; discuss advantages of wool; heat absorption; colors; head radiation; heat conductivity; evaporation (one hour).

VIII. EQUIPMENT

General requirements.—(1) Minimum weight; (2) proper suspension and distribution; (3) facility of putting on and removing; (4) easy segregation and removal of unnecessary parts for fighting and marching; (5) simplicity of construction and ease of repair; (6) sanitary construction. Illustrate with soldier in full pack with new equipment (two hours).

IX. AIR

Composition—oxygen, nitrogen, argon. Oxygen indispensable to the maintenance of life. Nitrogen inert gas.

X. VENTILATION

Cause of air contamination; dust; nature of ventilation; natural ventilation—diffusion of gases, action of wind, and thermal circulation; artificial ventilation (very brief); relation of bad ventilation in barracks to disease among soldiers (one hour).

XI. EXCRETA, GARBAGE, AND WASTE

Latrines.—Construction of; reasons for; types—trenches; latrine box; police and disinfection of each; sites, relation to civil population. Illustrate types of latrine by schematic drawings and construction (three hours).

Final disposition of feces and garbage.—(1) Discharge into sea, lake, or river; (2) biological treatment; (3) local treatment: (a) Incinerators, types, construction of; reasons for (take this up first); (b) dead animals (two hours).

XII. SOILS

Ground air (brief).

Ground moisture (brief).

Ground temperature (brief).

Influence of vegetation in soil.

Pollution and soil bacteria.

(One hour.)

XIII. CAMPS

Selection of site.—Soil; vegetation; exposures; wood; water; grass; poisonous plants; venomous animals (one hour).

Tents.—Shelter; wall; pyramidal; hospital; illustrate by pitching or seeing pitched (seven hours).

Form of camp.—Make schematic drawing on board of camp of unit or detachment (one hour).

XIV. DISINFECTION AND DISINFECTANTS

Air and light.

Heat.—Steam; dry.

Chemical disinfectants.—Gases—chlorin, SO_2 , formaldehyde, paraform.

Disinfecting agents in solution or powder.—Bichloride of mercury; mineral acids; formalin; carbolic acid; cresols; chloride of lime; quicklime.

(Two hours.)

XV. GENERAL SANITARY RULES

(1) Food—sufficient, wholesome, varied, well cooked.

(2) Prohibit sale of food and drinks by hucksters; no food in tents.

(3) Prevent contamination of water supply.

(4) Great concentration of troops should be avoided.

(5) Personal hygiene; cleanliness of body and clothing; fight with empty bowels and bladder.

(6) Latrines.

(7) Do not forget the rôle of flies and mosquitoes in transmission of disease.

(8) Cleaning, policing, and disinfection of camp grounds.

(9) Move camp location if practicable.

(Eight hours.)

XVI.

Model sanitary divisional order (see General Order No. 7, headquarters 89th Division, September 11, 1917).

XVII.

Work in orthopedics.—Care of feet. (One hour once a month under the direction of the orthopedic surgeon; three hours.)

Schedule of training for enlisted men, Medical Department

	Thursday, Nov. 1	Friday, Nov. 2	Saturday, Nov. 3	Monday, Nov. 5	Tuesday, Nov. 6	Wednesday, Nov. 7	Thursday, Nov. 8	Friday, Nov. 9
7.45 to 8.30 a. m. TRAINING FOR DENTAL CORPS

The personnel of the Dental Corps received its basic training in conjunction with the personnel of the Medical Department as a whole. The program for the professional training of dental officers in the subjects pertaining to that corps was prepared under the direction of the division surgeon by the supervising dental surgeon of the camp, and he was held responsible for this special training not only of personnel of the division but for all dental officers of the camps.¹⁵

TRAINING FOR VETERINARY CORPS

One of the general duties of veterinary officers during the World War was the training of personnel under their command with regard to their professional and military duties and responsibilities.¹⁶ Prior to February, 1918, a number of division veterinarians organized schools of instruction for veterinary personnel. In some instances these were included in the general scheme of divisional schools.¹⁷ An example of the work given in this period is found in the course of instruction for veterinary officers and enlisted men of the 40th Division, Camp Kearny, Calif. This course covered a period of 6 weeks, with a minimum requirement of 28 hours' intensive and thorough training. The course in the use of arms was not given because arms were not available.¹⁷

OFFICE OF THE DIVISION VETERINARIAN,
40TH DIVISION,
Camp Kearny, Calif., January 26, 1918.

The following schedule of training in the Veterinary Corps of the 40th Division is hereby announced:

* * * * *

This course is to cover a period of six weeks, with the minimum requirement each week of 28 hours intensive and thorough training.

OUTLINE OF INSTRUCTION

STABLE MANAGEMENT

The men are not to be used for stable police or as general grooms. However, proper and thorough grooming is to be taught in detail.

Stable management is to be given in five lectures.

Lecture 1:

- (a) Intent of grooming.
- (b) Structure and function of the skin.
- (c) Grooming utensils, their use and abuse.
- (d) Wisps, how to make and use.

Lecture 2:

- (a) Sponges, use and abuse.
- (b) Use of thorough grooming and massage, in helping to keep sick animals fit.
- (c) Routine of grooming—cleaning of various parts, as body, limbs, head, mane, and tail.
- (d) Cleaning the hoof.
- (e) Cleaning the sheath.
- (f) How to deal with wet and muddy horses.

Lecture 3:

- (a) Hygiene of the picket line and stall.
- (b) Mucking out.
- (c) Bedding down.
- (d) Picket-line burning.
- (e) Drainage.
- (f) Ventilation in detail.

Lecture 4:

- (a) Clothing and bandages for warmth and their proper application.
- (b) Clipping—when, how, and why done; advantages and disadvantages.

Lecture 5:

- (a) Exercise—
 1. Its necessity in order to maintain health.
 2. Bearing on condition, grooming, and cleanliness.
- (b) Proper methods for securing animals on the picket line and in the stable.

FEEDS, FEEDING, AND WATERING (TO BE GIVEN IN FIVE LECTURES)

Lecture 1: (a) Anatomy of the digestive organs.

Lecture 2: (a) Physiology of the digestive organs.

Lecture 3:

- (a) Teeth, care and importance.
- (b) Relation of amount and kind of food for work demanded.
- (c) Kinds of forage, amounts usually given, ratios for various classes of animals at rest and at work.
- (d) Proper storage of forage.

Lecture 4:

- (a) Nosebag feeding; care of nosebag; dangers.
- (b) Making bran mashes.
- (c) Use of green feed.

Lecture 5:

- (a) Care of feed boxes and mangers.
- (b) Watering—
 1. Kinds of water,
 2. Source of dangers.
 3. Care of watering troughs.
- (c) Salt.

SCHOOL OF THE TROOPER

Will use Cavalry Drill Regulations, both dismounted and mounted drills, giving particular attention to squad drill, omitting rifle and saber drills, but including pistol drill.

HANDLING ANIMALS AND OTHER POINTS (TO BE GIVEN IN FIVE LECTURES)

Lecture 1:

- (a) How to trot a led horse properly.
- (b) Restraint—
 1. Use of stocks, switches, and blinds.
 2. Casting—use and abuse. Casting rope or harness, hobbles, casting for operation, fixation of limbs when cast.
 3. Speculum—examining and floating the teeth.

Lecture 2:

- (a) Passing catheter (mare and horse).
- (b) Passing stomach tube (orally and by the nares).
- (c) Giving inhalations.
- (d) Giving enemata.

Lecture 3:

- (a) Balling.
- (b) Drenching—bottle and dose syringe; dangers.
- (c) Application of tourniquet.
- (d) Blistering and fiding.

Lecture 4:

- (a) Preparation of the field of operation.
- (b) Poulticing.
- (c) Liniments and other external remedies.
- (d) Fomentations of the limbs, chest, belly, and precautions to be taken to avoid chills subsequently.

Lecture 5: (a) Bandaging—

1. Making and application of all kinds for warmth, exercise, or surgical use.
2. The bandaging of wounds, joints, and swellings; when and how such should be employed or avoided.
3. Pressure bandages, hot and cold bandages, cloths, and rugs.

ARMY REGULATIONS

1. Should not neglect "honors, courtesies, ceremonies, etc."
2. This instruction should also include the major and important regulations applicable.

CARE OF THE SICK AND INJURED (TO BE GIVEN IN FIVE LECTURES)

Lecture 1:

- (a) Teach routine of observation of cases—
 1. Respiration—number per minute, quality, significance.
 2. Pulse—number per minute, quality.
 3. Temperature—normal. Thermometry.
 4. Skin, appetite, feces, urine, etc.
- (b) Attention to watering and feeding sick animals.
- (c) Provision of head rests when necessary.
- (d) Ventilation without drafts.
- (e) Cleanliness of bedding.

Lecture 2:

- (a) Slings—use, how to be applied, cleaning, prevention of slipping.
- (b) Ambulances—moving horses into and out of.
- (c) Care of horses down and unable to rise—
 1. Frequent turning and how to do it.
 2. Care of bedding to prevent bed sores.
 3. Attention to bowels and urine when down.
- (d) Cast horses, assisting to rise.

Lecture 3:

- (a) Control of hemorrhages; tourniquet, ligature, bandaging, packs, cautery, forceps, medicinal, etc.
- (b) Destruction of animals, humanely and quickly.

Lecture 4:

- (a) Skin cases—washing, dressing, and clothing.
- (b) Dressing of wounds—cleanliness, antiseptics, etc.

Lecture 5:

- (a) Lameness—noting alterations of positions.
- (b) Colics—
 1. Use of walking exercises, enemata, and belly fomentations.
 2. Value of recording state of pulse and mouth at intervals.
 3. Rectal examination—dangers.
 4. Routine emergency treatment and after treatment.
 5. Prevention.

METROLOGY: MEASURES OF MASS, CAPACITY, LINEAR MEASURE, AND HEAT (TO BE GIVEN IN FIVE LECTURES)

Lecture 1: (a) Metric system—

1. Derivation of units.
2. Tables.

Lecture 2:

- (a) Avoirdupois system.
- (b) Apothecaries' system—
 1. Weight.
 2. Capacity.

Lecture 3:

- (a) Linear systems in common use.
- (b) Domestic measures.

Lecture 4:

- (a) Review of lectures 1, 2, and 3.
- (b) Thermometers—

I. Changing between centigrade and Fahrenheit.

Lecture 5: (a) Transposing between different systems respective of mass, capacity, and linear.

MEDICINAL AGENTS (TO BE GIVEN IN FIVE LECTURES)

Lecture 1:

- (a) Drugs, use and abuse.
- (b) Those in common use, actions, dosage.

Lecture 2: (a) Drugs in common use, dosage, continuation of lecture 1.

Lecture 3: (a) Poisons, dangerous dosage, antidotes.

Lecture 4: (a) Preparations used in emergency treatments.

Lecture 5: (a) Administration of medicines.

DISINFECTION (TO BE GIVEN IN TWO LECTURES)

Lecture 1:

- (a) Explanation of terms; disinfectant, antiseptic, contagion, infection, absolute cleanliness, fumigation.
- (b) Details of disinfection of buildings, yards, cars, and ships.

Lecture 2:

- (a) Official disinfectants.
- (b) Strengths and how used.
- (c) How to make different percentage solutions.

FIRST AID TO THE SICK AND INJURED (TO BE GIVEN IN THREE LECTURES)

Lecture 1: (a) Wounds; varieties and emergency treatments.

Lecture 2: (a) Continuation of lecture 1.

Lecture 3: (a) Contagious diseases; described, precautions, methods of dealing with outbreaks, with reasons for each.

THE FOOT AND SHOEING (TO BE GIVEN IN FIVE LECTURES)

Lecture 1: (a) Anatomy of the foot (demonstrate).

Lecture 2:

- (a) Physiology of the foot.
- (b) Pathology of the foot.

Lecture 3: (a) Principles of shoeing.

Lecture 4: (a) Accidents and minor diseases of the foot and their first-aid treatment.

Lecture 5: (a) Examination of the foot.

MANAGEMENT OF ANIMALS (TO BE GIVEN IN FOUR LECTURES)

Lectures 1 and 2: (a) On the march and in camp—

1. Feeding and watering.
2. Protection from weather, clothing.
3. Sanitation of lines and camp.
4. Picketing.
5. Marching of such sick or injured animals as is necessitated.

Lecture 3: (a) On shipboard—

1. Preparation and care of animals during voyage.
2. Feeding and watering.
3. Shipboard sanitation.
4. Exercise.
5. Slings and other modes of embarking and disembarking, how to swim horses.
6. Diseases.

Lecture 4: (a) In the hospital.

PAPER WORK (TO BE GIVEN IN THREE LECTURES)

Lecture 1:

- (a) Letter writing (comp. gen. orders).
- (b) Requisitions.
- (c) Returns.

Lecture 2:

- (a) Descriptive lists of animals.
- (b) I. and I. report.
- (c) Certificates.
- (d) Affidavits.

Lecture 3:

- (a) Clinic daybook.
- (b) Ledger.

NECROPSIES (TO BE GIVEN IN ONE LECTURE)

Lecture 1:

- (a) Precautions.
- (b) Methods of making post-mortem examinations.

DISPOSAL OF CARCASSES (TO BE GIVEN IN ONE LECTURE)

Lecture 1:

- (a) Cremation—cross trench and other systems.
- (b) Burial—dangers of, proper methods.
- (c) Food carcasses—meat inspection.

OPERATIONS (TO BE GIVEN IN ONE LECTURE)

Lecture 1:

- (a) Assistance at.
- (b) Administration of anesthetics.
- (c) Aftercare.

VETERINARY EQUIPMENT (TO BE GIVEN IN TWO LECTURES)

Lecture 1:

- (a) Care.
- (b) Packing and unpacking.

Lecture 2: (a) Pack mule transportation (instruction, with demonstrations, in packing veterinary equipment).

ANATOMY (TO BE GIVEN IN SIX LECTURES)

Lectures 1 to 6, inclusive: Elementary structure of the various organs and parts.

PHYSIOLOGY (TO BE GIVEN IN SIX LECTURES)

Lectures 1 to 6, inclusive: Functions of the various organs and parts.

PARASITES AND PARASITIC CONDITIONS (TO BE GIVEN IN FIVE LECTURES)

Lectures 1 to 5, inclusive:

- (a) Transmission of disease.
- (b) Common parasites.
- (c) Life histories.
- (d) Recognition.
- (e) Prevention.
- (f) Economic importance.
- (g) Control.

SCHEDULE OF INSTRUCTION

FIRST WEEK

Monday:

- 6 to 6.20 a. m.----- Physical drill.
- 7.45 to 9.15 a. m.----- Stable management.
- 9.15 to 11.30 a. m.----- Feeds, feeding, and watering.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Articles of War.

Tuesday:

- 6 to 6.20 a. m.----- Physical drill.
- 7.45 to 9.15 a. m.----- Stable management.
- 9.15 to 11.30 a. m.----- Feeds, feeding, and watering.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Articles of War.

Wednesday:

- 6 to 6.20 a. m.----- Physical drill.
- 7.45 to 9.15 a. m.----- Stable management.
- 9.15 to 11.30 a. m.----- Feeds, feeding, and watering.
- Half holiday.

Thursday:

- 6 to 6.20 a. m.----- Physical drill.
- 9.15 to 11.30 a. m.----- Feeds, feeding, and watering.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Army Regulations.

Friday:

- 6 to 6.20 a. m.----- Physical drill.
- 7.45 to 9.15 a. m.----- Stable management.
- 9.15 to 11.30 a. m.----- Feeds, feeding, and watering.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Army Regulations.

Saturday:

- 6 to 6.20 a. m.----- Physical drill.
- 8.20 a. m.----- Inspection.
- Half holiday.

SECOND WEEK

Monday:

- 6 to 6.20 a. m.----- Physical drill.
- 7.45 to 9.15 a. m.----- Handling animals, and their points.
- 9.15 to 11.30 a. m.----- Care of the sick and injured.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Army Regulations.

Tuesday:

- 6 to 6.20 a. m.----- Physical exercises.
- 7.45 to 9.15 a. m.----- Handling animals, and their points.
- 9.15 to 11.30 a. m.----- Care of the sick and injured.
- 1 to 2 p. m.----- School of the trooper.
- 2 to 3 p. m.----- Army Regulations.

Wednesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Handling animals, and their points.
9.15 to 11.30 a. m.-----	Care of the sick and injured.
Half holiday.	

Thursday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Handling animals, and their points.
9.15 to 11.30 a. m.-----	Care of the sick and injured.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Army Regulations.

Friday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Handling animals, and their points.
9.15 to 11.30 a. m.-----	Care of the sick and injured.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Army Regulations.

Saturday:

6 to 6.20 a. m.-----	Physical exercises.
8.20 a. m.-----	Inspection.
Half holiday.	

THIRD WEEK

Monday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Metrology.
9.15 to 11.30 a. m.-----	Medicinal agents.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Tent-pitching drills.

Tuesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Metrology.
9.15 to 11.30 a. m.-----	Medicinal agents.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Tent-pitching drills.

Wednesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Metrology.
9.15 to 11.30 a. m.-----	Medicinal agents.
Half holiday.	

Thursday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Metrology.
9.15 to 11.30 a. m.-----	Medicinal agents.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Tent sanitation.

Friday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Metrology.
9.15 to 11.30 a. m.-----	Medicinal agents.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Personal hygiene.

Saturday:

6 to 6.20 a. m.-----	Physical exercises.
8.20 a. m.-----	Inspection.
Half holiday.	

FOURTH WEEK

Monday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Disinfection.
9.15 to 11.30 a. m.-----	First aid.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Veterinary Corps, organization and personnel.

Tuesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Disinfection.
9.15 to 11.30 a. m.-----	First aid.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Paper work.

Wednesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	First aid.
9.15 to 11.30 a. m.-----	The foot and shoeing.
Half holiday.	

Thursday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	The foot and shoeing.
9.15 to 11.30 a. m.-----	Management of animals.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Paper work.

Friday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	The foot and shoeing.
9.15 to 11.30 a. m.-----	Management of animals.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Paper work.

Saturday:

6 to 6.20 a. m.-----	Physical exercises.
8.20 a. m.-----	Inspection.
Half holiday.	

FIFTH WEEK

Monday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	The foot and shoeing.
9.15 to 11.30 a. m.-----	Management of animals.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Tuesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	The foot and shoeing.
9.15 to 11.30 a. m.-----	Management of animals.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Wednesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Necropsies.
9.15 to 11.30 a. m.-----	Disposal of carcasses.
Half holiday.	

Thursday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Operations.
9.15 to 11.30 a. m.-----	Veterinary equipment.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Friday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Veterinary equipment.
9.15 to 11.30 a. m.-----	Anatomy.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Saturday:

6 to 6.20 a. m.-----	Physical exercises.
8.20 a. m.-----	Inspection.
Half holiday.	

SIXTH WEEK

Monday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Anatomy.
9.15 to 11.30 a. m.-----	Parasites.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Tuesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Anatomy.
9.15 to 11.30 a. m.-----	Parasites.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Physiology.

Wednesday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Anatomy.
9.15 to 11.30 a. m.-----	Parasites.
Half holiday.	

Thursday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Anatomy.
9.15 to 11.30 a. m.-----	Parasites.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Practice walk.

Friday:

6 to 6.20 a. m.-----	Physical exercises.
7.45 to 9.15 a. m.-----	Anatomy.
9.15 to 11.30 a. m.-----	Parasites.
1 to 2 p. m.-----	School of the trooper.
2 to 3 p. m.-----	Practice walk.

Saturday:

6 to 6.20 a. m.-----	Physical exercises.
8.20 a. m.-----	Inspection.
Half holiday.	

Under date of January 30, 1918, the following outline of instruction was sent division veterinarians and veterinarians of auxiliary remount depots:¹⁶

SCHEDULE OF INSTRUCTIONS FOR OFFICERS OF VETERINARY CORPS ATTACHED TO DIVISIONS
OR AUXILIARY REMOUNT DEPOTS

The course will extend over a period of at least 10 weeks, and should cover the following subjects:

ARMY REGULATIONS

Recitations and practical work in Army Regulations, including muster rolls, pay rolls, correspondence as covered by Army Regulations and General Orders (10 hours).

Customs of the service (2 hours).

Manual of Courts-Martial—recitations and lectures (4 hours).

Veterinary Service regulations—recitations (4 hours).

Organization of veterinary units (4 hours).

Veterinary hygiene and stable management, feeds and feeding, food values, water supply and water, ventilation, building sites for stables and picket lines, routine stable management (20 hours).

Control of communicable diseases (5 hours).

Practical work in proper fitting of equipment of cavalry, artillery, draft and pack animals (10 hours).

Equitation (20 hours).

Drill, setting-up exercises, foot movement, saluting, marching (until proficient).

Training in the use of arms (until proficient).

The instruction will be practical, and paper work will be accomplished in studying subjects requiring same.

Recitations will be the rule in assembled class. Studying will be done outside the class periods.

Six hours weekly will be devoted to recitations and practical work.

Five hours weekly will be devoted to equitation, drill, and training in the use of arms.

By direction of the Surgeon General:

_____,
Lieutenant Colonel, Medical Corps, U. S. Army,
Acting Director, Veterinary Service.

Under date of May 9, 1918, the following letter relative to schools and instruction was sent division veterinarians by the Surgeon General:¹⁷

1. Pursuant to the issue of schedules of instruction for officers and enlisted men of the Veterinary Corps, attached to divisions and auxiliary remount depots, dated January 30, 1918, training schools were organized in each camp and remount depot.

2. Some of these schools developed satisfactory courses, detailed reports of which have been submitted to the Surgeon General. From others no reports have been received except through general veterinary inspectors.

3. As the schedules of instruction referred to in paragraph 1 (this letter) were general in character, obviously great variations in the kind of training given resulted.

4. An attempt is being made to standardize these courses of instruction in order that the training imparted will be uniform throughout the service.

5. It is therefore requested that you forward to the Office of the Surgeon General, veterinary division, a detailed report of the activities of the school or course of instruction under your command since its formation, if you have not already done so.

6. Relevant suggestions and constructive criticism are desired.

Up to August, 1918, no data had been received pertaining to instruction of veterinary personnel in 20 divisions. In 2 divisions the instruction given was of an irregular nature, while in 18 divisions the instruction given was thorough, inclusive, and conducted according to approved schedules.

During August and September, 1918, an outline for systematic courses of instruction, as given below, was issued by the Surgeon General to the division veterinarians of 12 divisions (9th to 20th, inclusive) for the training of veterinary officer and enlisted personnel. These courses were conducted to completion in 10 divisions and, due to demobilization and other causes, only partially completed in 2. Later reports show that no instruction was conducted in the 95th and 96th Divisions and that a partially completed course of instruction was accomplished in the 97th Division.¹⁷

WAR DEPARTMENT,
OFFICE OF THE SURGEON GENERAL,
Washington, August 26, 1918.

From: The Surgeon General.

To: Division veterinarians, 9th to 20th Divisions.

Subject: Instruction.

1. It is the desire of this office to establish a uniform course of instructions for the veterinary officers and men in all camps where a division is stationed, and, in order that this may be accomplished, the inclosed schedule of instructions is issued for your guidance and strict compliance.

2. The work pertaining to the treatment of sick animals and necessary sanitation is to be considered paramount and will not be neglected for the course of instruction. It is expected, however, that the necessary veterinary work will be thoroughly done and this instruction carried out at the same time.

3. It is incumbent upon every camp veterinarian to see that the veterinary officers and enlisted men of the division and camp attain a high degree of efficiency, and this can be accomplished by utilizing the formative period of the division in this country for intensive training. It is expected, however, that the course shall be continued in both camp and division after the division leaves. It is contemplated that every officer and man shall become proficient in the subjects outlined, and failure to do so should become the basis of official action. Recommendations for the promotion or elimination of officers and promotion and rejection of enlisted men should be based on progress shown in the course.

4. The instruction should be commenced as soon after the receipt of this letter as practicable. The course is so arranged that officers and enlisted men can start training at almost any time, and the subjects they have missed can be taken up at the end of the course.

5. *Instruction.*—(a) The camp veterinarian, who is also the division veterinarian, should personally supervise all instruction. The enlisted men should be given instruction as one class and not by individual units. The training of units as such in the necessary performance of their duties will not be neglected.

(b) This instruction will include the veterinary personnel attached to the depot brigades, camp headquarters, and any detached organizations which may be in the camp. The men assigned to the camp meat inspector will be required to take at least the school of the soldier and foot drill. For the enlisted personnel this course of instruction should be commenced when 40 per cent of the men are present.

(c) Whenever lectures are given or it is necessary to utilize a textbook for class reading, a quiz should always follow each lesson. Recitations will be held as outlined in schedule of instructions. It is believed the best results will be secured by invariably requiring men to recite what they have studied. The camp veterinarian will take steps to see that his officers are provided with the necessary textbooks.

(d) Efforts should be made to have the instruction continuous, and it is expected that the schedule will be followed as published. It will be changed only for good and sufficient reasons, and when this is done a full explanation will be submitted.

(e) The schedule is arranged according to weeks, but when exigencies of the service prevent the completion of any week's work it will be continued the following week and completed before taking up a new subject.

(f) Officers who have satisfactorily completed the training-school course and are found to be fully competent should be utilized as instructors for the enlisted men's classes. Officers' and enlisted men's classes can then be held simultaneously.

(g) A report will be submitted every Sunday direct to this office, covering the preceding week, giving the officers and enlisted men present, instruction accomplished, hours used for both officers' and enlisted men's classes. Officers and noncommissioned officers will be marked for each day's work, including examinations, on a scale of 10. An average mark of 7 will be considered as qualifying in a subject.

6. *Daily conference.*—The camp veterinarian will institute a daily conference, which all the veterinary officers in the camp and the divisional units will be required to attend. Questions pertaining to veterinary matters, unusual medical and surgical cases of importance,

sanitation in connection with stables, grooming, feeding, forage, etc., veterinary personal equipment, discipline, and regulations are matters to be considered. These conferences aim at closer cooperation in the veterinary service and should tend to increase its efficiency as one large unit instead of separate organizations. It is contemplated that these conferences will continue indefinitely.

7. The receipt of this letter to be acknowledged.

By direction of the Surgeon General:

C. F. MORSE,
Lieutenant Colonel, Medical Corps,
Director Veterinary Corps.

Schedule of instruction for veterinary officers

Hours	Subject	Daily lesson
FIRST WEEK		
5	Routine duties of the veterinary officers.----- 1. Handling enlisted men, relation between status of officers and men, etc.----- 2. Daily inspections for unit veterinarians (covering sanitary conditions of stables and corrals, forage, feeding and watering, mangers and watering troughs, grooming, exercise, inspection of shoeing, condition of feet, fitting of equipment). 3. Admission to sick report, method of recording diagnosis, etc. (Form 115), transfers, return to duty. 4. Detection of communicable diseases, procedure, disposition of the case, quarantine reports. 5. Extent of treating animals with medicines and supplies authorized for field units. 6. Evacuation of animals by mobile veterinary section. 7. Frequent consultation with troop, battery, and company commanders to establish harmonious relations regarding veterinary matters. See Circular Letter 27, veterinary division, Surgeon General's Office. This is suggestive of subjects to be covered. Additional subjects may be introduced at the discretion of the instructor.	$\frac{1}{2}$ hour lecture. $\frac{1}{2}$ hour. Practical work. (Visiting picket lines; inspecting animals well and sick; observing and reporting sanitary defects in corrals and stables.)
7 $\frac{1}{2}$	School of the soldier; foot drill.----- Textbook----- Drill Regulations and Service Manual for Sanitary Troops, United States Army, 1917 edition.	Pp. 9 to 17, par. 39. Pars. 40 to 54, inclusive. $\frac{1}{2}$ hour recitation; 1 hour drill.
SECOND WEEK		
6	Special Regulations No. 70, War Department (Army veterinary service)-----	1. Pars. 1 to 22. 2. Pars. 23 to 41. 3. Pars. 42 to 69. 4. Pars. 71 to 87. 5. Pars. 88 to 112. 6. Review.
7 $\frac{1}{2}$	School of the soldier; foot drill (continued)-----	Pp. 87 to 127; pars. 338 to 394, 404 to 407.
THIRD WEEK		
6	Special Regulations No. 70 (concluded)----- Circular letters, veterinary division, Surgeon General's Office, 1 to 27. Amendments Special Regulations No. 70.	1. Pars. 113 to 130. 2. Pars. 140 to 155. 3. C. R. 1 to 11. 4. C. R. 12 to 18. 5. C. R. 19 to 26. 6. Review.
7 $\frac{1}{2}$	School of the soldier; foot drill-----	1 $\frac{1}{2}$ hours daily.
FOURTH WEEK		
6	Army Regulations (with changes to No. 73)----- Blank forms referred to: Service record, par. 104; furlough, par. 106; descriptive list, deserter, par. 118; final statement, par. 140; certificate of disability, par. 159; death and disposal of remains, par. 162 $\frac{1}{2}$; noncommissioned officer's warrant, par. 274; sick report, par. 280; morning report, par. 280; descriptive list, card, public animals, par. 280; council book, pars. 327 to 280; delinquency record, par. 280; service record, par. 280; daily roster, par. 355.	1. Pars. 1 to 92. 2. Pars. 104 to 177. 3. Pars. 245 to 302, 316 to 330. 4. Pars. 355 to 416. 5. Pars. 416 to 440, 464 to 470, 491, 582 to 630. 6. Review.
10	Equitation-----	2 hours daily preliminary instruction (pars. 55 to 86, Drill Regulations for Sanitary Troops, United States Army, 1917).
FIFTH WEEK		
6	Army Regulations----- Blank forms referred to: Report of survey, 711; 1. and I. reports, 903; forage requisitions, 1077.	1. Pars. 657 to 703, 710 to 725, 732 to 739. 2. Pars. 774 to 790, 791 to 803, 807 to 833. 3. Pars. 878 to 914, 915 to 1000. 4. Pars. 1024 to 1073, 1077 to 1085, 1086 to 1099. 5. Pars. 1160 to 1145. 6. Review.
10	Equitation (continued)-----	2 hours daily.

Schedule of instruction for veterinary officers—Continued

Hours	Subject	Daily lesson
SIXTH WEEK		
6	Army Regulations..... Ration returns, 1209; pay rolls; allotment blanks; deposit books.	1. Pars. 1146 to 1183. 2. Pars. 1184 to 1193, 1195 to 1199, 1200 to 1238. 3. Pars. 1239 to 1254, 1256 to 1298. 4. Pars. 1299 to 1340, 1347 to 1360. 5. Pars. 1361 to 1383, 1386 to 1387, 1408 to 1420, 1447 to 1463. 6. Review.
10	Equitation.....	2 hours daily.
SEVENTH WEEK		
4	Army Regulations..... Property returns.	1. Pars. 1071 to 1076, 1486, 1513, 1537. 2. General review. 3. 2 hours examination.
3	Organization of veterinary units..... Tables of Organization No. 43: 1 veterinary field unit, 1 mobile veterinary section, 1 division veterinarian. Tables of Organization No. 109: Corps mobile veterinary hospital. Tables of Organization No. 330: Base veterinary hospital. Tables of Organization No. 331: Veterinary hospital. Veterinary equipment for units: References—Circular Letter No. 26, veterinary division, Surgeon General's Office; changes in pars. 902, 996, 967, 968, 970, 974 of Manual of the Medical Department and additional paragraphs 978 to 992, inclusive.	3 recitations.
3	Manual of Military Courts-Martial..... Articles of War: Formation of summary, special, and general courts; procedure for preferring charges, etc.	3 lectures and recitations.
2	Tent pitching..... Shelter tents, pars. 424 to 429; pyramidal tents, pars. 432 to 442; Drill Regulations and Service Manual for Sanitary Troops, United States Army, 1917 edition.	Practical work.
EIGHTH WEEK		
4	Army paper work..... Working knowledge of reports required by Circular No. 17, veterinary division Surgeon General's Office. Form 47 A. M. D. Sundry requisitions and papers. Certificate—Death of public animals, Army Regulations 1073; service records. Requisition for forage, Form 218, Q. M. C. Requisition for tableware and kitchen utensils, Form 166, Q. M. C. Certificate of breakage, Form 207, Q. M. C.; return of ordnance; return of horse equipment. Return of medical property, Form 17, A. B. C., M. D.; ration return, Form 223, Q. M. C.; survey reports; morning reports; sick reports. Veterinary medicines and supplies, Form 35, M. D. Requisition for clothing (bulk), Form 213, Q. M. C. Requisition for clothing (individual) Form 165, Q. M. C.	Demonstrations and recitations.
2	Customs of the service..... Officer's Manual (Moss) recommended for reference.	1 lecture; 1 recitation.
10	Manual of small arms pertaining to automatic pistol caliber .45..... Textbooks: Manual of the Automatic Pistol, caliber .45, model 1911, War Department, Document No. 801, The Adjutant General's Office (can be obtained by letter direct to The Adjutant General's Office). Small Arms Firing Manual, 1913, corrected to Mar. 15, 1918, pars. 167 to 175, inclusive. Attempt should be made to borrow enough pistols for class demonstration and target practice, if they are not furnished. It is very important that every officer and man become thoroughly familiar with this pistol, its parts, etc.	Demonstration and knowledge of parts of pistol; practical work; target practice.
NINTH WEEK		
7½	Veterinary hygiene..... Food values (pars. 155 to 202, Sanitary Service Manual); water supply; disposal of manure; ventilation; building sites for stables and picket lines; use of baling wire, for fences, racks, etc.; stable management; quarantine, methods of disinfection; floors for stalls, picket lines, methods of proper repair; drainage, disposal of carcasses (cremation, cross trench; and other systems, burial, danger of; proper methods); care of feet; clothing. Text: Smith's Veterinary Hygiene should be borrowed from veterinary hospital, remount depot, and used as text to cover subject thoroughly. Control of communicable diseases..... Text: Epizootics and Their Control During War (Leibold). NOTE.—May be borrowed from remount veterinary hospital as noted above.	1½ hours daily; 5 periods. 1. Pt. 1. 2. Pp. 29 to 84. 3. Pp. 84 to 126. 4. Pp. 127 to 153. 5. Pp. 155 to 207. 6. Review.

Schedule of instruction for veterinary officers—Continued

Hours	Subject	Daily lesson
TENTH WEEK		
6	Field service regulations, 1914, corrected to Apr. 15, 1917.....	1. Pp. 9 to 11, 43 to 50, 51 to 72. 2. Pp. 114 to 122, 123, 124 to 129. 3. Pp. 130 to 132, 133 to 159. 4. Pp. 171 to 178, 179 to 180, 181 to 185. 5. Review.
5	Cavalry full-pack equipment..... Field Artillery—harness fitting; draft harness. Pack-animal equipment and fitting. Gas defense instruction: Arrangements should be made with proper officer of the division to have all officers and men take prescribed course in gas defense. Instruction in first aid should be arranged with the surgeon.	Practical work and demonstrations.

Schedule of instruction for enlisted men, Veterinary Corps

Hours	Subject	Daily lesson
FIRST WEEK		
6	Stable management..... Textbook: Manual for Stable Sergeants, War Department Document 611, The Adjutant General's Office.	1. Pars. 119 to 130. 2. Pars. 131 to 155. 3. Pars. 156 to 202. 4. Pars. 203 to 227½. 5. Pars. 228 to 244. 6. Review.
1½	Military courtesies.....	1½ hours.
6	Army Regulations, pars. 375 to 392½. To be read and carefully explained. School of the soldier and detachment (detachment formation for inspection); foot drill. Textbook: Drill Regulations and Service Manual for Sanitary Troops, United States Army, 1917; (1) pt. 1 to par. 55, (2) pars. 87 to 127, inclusive, (3) pars. 388 to 394.	1½ hours daily for 4 days.
SECOND WEEK		
6	Stable management.....	1. Pars. 244 to 257. 2. Pars. 258 to 282. 3. Pars. 283 to 345. 4. Pars. 346 to 362. 5. Pars. 363 to 373. 6. Review.
7½	School of the soldier and detachment; foot drill (continued).....	1½ hours daily.
THIRD WEEK		
6	Communicable diseases..... (1) Glanders, (2) influenza, (3) mange, (4) lice, (5) isolation—quarantine; disinfection (pars. 464 to 487, Sanitary Service Manual). NOTE.—The enlisted personnel should have at least an elementary knowledge of these diseases and conditions in order that they may be able to recognize them when the necessity arises.	To be by lectures, recitations, and inspection, of cases when possible.
7½	School of the soldier and detachment; foot drill.....	1½ hours daily.
FOURTH WEEK		
2	Cavalry pull-pack equipment..... See memorandum attached; also appendix. Drill Regulations and Service Manual for Sanitary Troops, 1917.	2 lessons, 1 hour each, putting together and taking apart equipment per memorandum attached.
4	Pack-saddle equipment..... See Manual of the Medical Department, par. 953, for directions. For entire enlisted personnel.	2 lessons, 2 hours each.
7½	School of the soldier detachment; foot drill.....	1½ hours daily.
3	Army paper work, for noncommissioned officers, farriers, and selected privates..... These men should be given instruction in the paper work necessary for the various veterinary units of a division. 1. Official correspondence and indorsements. See Army Regulations, pars. 775, 776, 777, 782, 783. 2. Service records. See directions on pp. 1 and 2 and explain. 3. Promotions and demotions for enlisted grades in the Veterinary Corps; also Army Regulations, pars. 270, 272, 274, 275, 276, 277, 278. See circular letter, veterinary division No. 13, revised Aug. 14, 1918; General Order 58, par. 10, War Department, June 22, 1918. 4. Working knowledge of ration returns. See directions on cover of ration return book.	1 hour, three times a week.

Schedule of instruction for enlisted men, Veterinary Corps—Continued

Hours	Subject	Daily lesson
FIFTH WEEK		
10	Equitation..... Textbook: Preliminary instruction, Drill Regulations and Service Manual for Sanitary Troops, 1917, pars. 55 to 86. NOTE.—If there are not sufficient horses for equitation for the entire personnel, facilities will be utilized so far as possible with view to training the largest number of men. Time assigned to equitation to be used for foot drill when equitation is impossible from lack of animals or equipment.	2 hours.
2	Foot drill.....	1 hour twice a week.
3	Army paper work (continued)..... 5. Sick report. See directions in sick report book. Army Regulations, pars. 1471-1472. 6. Memorandum receipts. Army Regulations, par. 281; Manual for the Quartermaster Corps, United States Army, vol. 1, 1916, pars. 2073 to 2091, inclusive. 7. Property—medical, quartermaster, ordnance (defined, Army Regulations, par. 1512). (a) Accountability and responsibility, Army Regulations, pars. 657 to 701, inclusive. (b) Unserviceable, Army Regulations, par. 678 (changed by Changes, Army Regulations No. 56, War Department, 1917)—medical, Army Regulations, par. 1488; ordnance, Army Regulations, par. 1534; accountability, Army Regulations, par. 1535; quartermaster, Army Regulations, par. 678 (changed by Changes, Army Regulations, No. 56, War Department, 1917). (c) Expendable and nonexpendable—medical, p. 245, Manual of the Medical Department; quartermaster, Manual of the Quartermaster Corps, United States Army, vol. 1, 1916, par. 2207; ordnance, see ordnance price list; lost and destroyed, Army Regulations, pars. 682 to 692, inclusive. (d) Equipment—(1) veterinary units, new paragraphs of Manual of the Medical Department, 985 and 988; (2) mobile veterinary section, new paragraphs of Manual of the Medical Department, 989 and 990.	1 hour three times a week.
SIXTH WEEK		
6	Tent pitching..... (1) Shelter tents and full field equipment. (2) Pyramidal tents. (3) Hospital wall tents. Textbook, pars. 424 to 434, Drill Regulations and Sanitary Manual for Sanitary Troops 1917.	1 to 2 hours daily for allotted time.
10	Equitation.....	2 hours daily.
2	Foot drill.....	1 hour twice a week.
3	Army paper work (continued)..... 8. Morning reports, daily changes, etc. See Special Regulations, War Department, No. 57 A, 1918. 9. Descriptive lists public animals. Also see changes, Army Regulations, pars. 1067, 1069, 1070. Inspection and inventory reports, public animals. Destruction, public animals, Army Regulations, par. 1073; Changes, Army Regulations, No. 58, 1917.	1 hour three times a week.
SEVENTH WEEK		
5	Manual of small arms..... Textbooks: Manual of the Automatic Pistol, Caliber .45, model 1911, War Department, Document No. 801 (can be obtained by letter from The Adjutant General's Office). Small Arms Firing Manual, 1917, corrected to Mar. 15, 1918, pars. 167 to 175, inclusive. Authority for ammunition for target practice and quote following indorsement under remarks on ordnance requisition: "471.4 pistol ball ammunition (Misc. Div.), War Department, The Adjutant General's Office, Apr. 4, 1918. To the Surgeon General, returned. Being armed as stated in General Order No. 8, War Department, 1918, it would seem that the allowance set forth in subparagraph C, par. 3, Special Regulations, 31, War Department 1917, applies. By order of the Secretary of War; J. B. Wilson, Adjutant General."	1 to 2 hours daily for allotted time.
10	Equitation.....	2 hours daily.
2	Foot drill.....	1 hour twice a week.
3	Army paper work (continued)..... 11. Forage and requisitions for same, Army Regulations, pars. 1077 to 1085. 12. Mess and mess management, Army Regulations, pars. 296 to 302. See Manual for Army Cooks.	1 hour three times a week.
EIGHTH WEEK		
15	Manual of small arms (continued).....	To completion.
1	Foot drill.....	1 hour a week.
1	Equitation.....	Do.

Schedule of instruction for enlisted men, Veterinary Corps—Continued

Hours	Subject	Daily lesson
NINTH WEEK		
6	Practical work for entire enlisted personnel. 1. Making and applying foot sac bandages. 2. Foot bandaging with regulation bandages. 3. Applying bandages to different parts of the body, legs, throat, chest; making and applying many-tailed bandages to knee and hock. 4. Practical demonstration of means of restraint, knee strap, rope; sidelines; how made and applied; throwing horse with hobbles, side lines—rope harness; preparation of and care of horse thrown. 5. Tying of knots; making rope harness, splicing of rope, care of same; making twitches. 6. Improvising slings; use of same; care of horses when in slings. 7. Improvising open air-operating areas for casting horses. 8. Preparations of animals for operations; cleaning parts, clipping operating areas, disinfection of parts, care of horses for operations where anesthesia is used.	2 hours at stables. Do.
1	Foot drill.	1 hour a week.
1	Equitation.	Do.
TENTH WEEK		
8	Practical work. 10. Handling and care of instruments. To include all articles supplied with the veterinary field-unit chest. 11. Methods used to disinfect or sterilize instruments, hands, etc., with facilities available. 12. Routine medical work. (1) Temperature; use of thermometer. (2) Respiration, number per minute, significance, quality; how observed. (3) Pulse; normal; how taken. 13. Administration of medicine. (a) By bolus. (b) Syringe; care of, precautions necessary; methods of controlling animal. (c) Hypodermic syringe; its study, to include care, how used, how to sterilize; capacity. (d) Disinfection of stables; corrals; field disinfectants. 14. Care to be taken in shipping horses by rail; preparation of cars, feeding; preparation of horses. 15. Use of baling wire for fences, hay racks, halter shanks, etc.; practical work making same. 16. Care of feet and shoeing. (1) Lecture covering condition of feet, care to be taken with same; dangers of excessive moisture, excessive dryness; proper shoeing injuries to feet and conditions following. (2) Practical demonstration at stables, 1 to 2 hours, examining feet, pointing out things taken up at lecture.	2 hours. Do. Do.
1	Foot drill.	1 hour.
1	Equitation.	1 to 2 hours.
		1 hour a week.
		Do.

HORSESHOER

A suitable man should be selected for horseshoer and arrangements made to have him attend the horseshoeing school at the remount depot.

GAS DEFENSE

Arrangements should be made to have all officers and men thoroughly instructed in this line.

FIRST AID AND PERSONAL HYGIENE

Arrangements should be made with the surgeon for necessary instructions in above subjects.

SETTING-UP EXERCISES

Daily, as prescribed by division or camp orders. If not provided for in such orders, the camp veterinarian will prescribe exercises to be taken, and every officer and man in divisional veterinary personnel will be required to take same as daily routine.

After this course of instruction is completed, it should be arranged, if practicable, to give the men of the divisional veterinary detachment at least 1 hour of foot drill and 1 hour of equitation a week.

By direction of the Surgeon General:

C. F. MORSE,
Lieutenant Colonel, Medical Corps,
Director Veterinary Corps.

A separate schedule which was used in connection with this instruction follows:¹⁶

MEMORANDUM—CAVALRY FULL PACK EQUIPMENT

Full pack consists of saddle, saddlebags, one United States feed bag, and roll. The roll consists of—

- 1 shelter half.
- 1 shelter half pole—on right of roll.
- 5 shelter half pins—on left of roll.
- 1 blanket—United States.
- 1 towel.
- 1 comb.
- 1 brush, tooth.
- 1 brush, hair.
- 1 cake of soap, toilet.
- 1 undershirt.
- 1 underdrawers.
- 1 pair of socks.

The above toilet articles laid evenly at upper end of roll so it will roll evenly and straight. Roll should not exceed 44 inches in length when rolled.

Feed bag: Inner white sack contains three feeds of grain for horse. When strapped to top of roll, the mark "U. S." should be on the right saddlebags.

Contents of right saddlebag:

- 2 horseshoes, front and hind.
- 16 horseshoe nails.
- 1 brush.
- 1 curry comb.
- Extra toilet articles.

Left saddlebag:

- Soldier's rations.
- Soldier's mess kit.

Strapped to side of left saddlebag:

- Picket pin; picket line, restrapped to cantle.
- Canteen strapped to right side of cantle.

IN POSTS

In May, 1917, department surgeons were provided by the Surgeon General with an outline similar to the one intended for divisional personnel quoted above, for a systematized course of instruction, which was to be carried out by medical officers at the military posts and relatively small stations under their jurisdiction.¹⁸ Department surgeons were made responsible for the effective carrying out of this course of instruction to the extent practicable under local conditions. From the outline sent to the department surgeons detailed courses of instruction were prepared and sent out to surgeons of stations and posts to be used as a basis for the training of sanitary personnel.

The extent to which this instruction was carried out varied with the local practicability for training and with the individual energy, initiation, and ingenuity of commanding officers, surgeons, and the instructors themselves. In many small stations it was necessarily largely a matter of personal reading, but in some of the larger posts many officers and men were given valuable and effective training.

The pressing need for officers for overseas service necessitated the rapid drawing away from posts of the younger, physically fit and alert, medical officers and their replacement by older men, generally over 50 years of age.

These older officers were just as patriotic and earnest as the younger officers, but as a class were not as adaptable to the needs of the service as were the men from 30 to 45 years of age. All officers assigned to posts in the early months of the war were generally not supplied with the service manuals and Army Regulations and in many instances there was delay in securing these books for them, thus preventing an early grasping by these officers of the details connected with Medical Department procedure in the Military Establishment. Many of the officers coming from small rural districts were also deplorably deficient in the scientific practice of their profession.¹⁹ These new medical men, derived from civil practice, however, found their places as best they could under Army conditions strange to them, and in the majority of instances soon came to appreciate the advantages to be derived from a practical course of schooling, which was instituted in practically all posts in accordance with the instructions quoted above.²⁰

In connection with the training of enlisted men in the posts, several important problems were to be met. The necessity for department surgeons to supply many hundreds of enlisted men in all grades to units forming inside their departments and elsewhere necessitated the establishment at some of the more important posts of large training detachments for the intensive training of these men.

In the Eastern Department, while training progressed in all the posts, the larger schools were established at first at Fort Myer, Va., Forts Hamilton and Jay, N. Y., where experienced medical officers directed the training and later at Fortress Monroe, Va., and Madison Barracks, N. Y.¹⁹

Large groups of partially trained recruits were being called for continually by department surgeons to be sent to hospitals forming within the departments. Later in the war the men furnished overseas units were replaced by limited-service men, who were distributed and absorbed by the different post hospitals throughout the departments. Every effort was made to bring these men up to a point of efficiency, but they proved generally unsatisfactory for Medical Department work.¹⁹

Before the establishment of the noncommissioned officers' schools at the larger stations the number of efficient noncommissioned officers became depleted, but the schools gradually decreased and corrected this shortage until, in at least the Eastern Department, there was a slight surplus of noncommissioned officers toward the close of the war.¹⁹

The constant changing of personnel, due to the demands of the service, made it impossible for many of the officers who commenced the courses to carry them to completion, but the reports received from stations show that conscientious effort was made in practically all stations and resulted in all cases in much improvement.¹⁹

In May, 1917, a camp intended primarily for the instruction of enlisted men was developed with about 50 medical officers and 2,000 enlisted men of the Medical Department at Fort Ethan Allen, Vt.²¹ This camp was variously designated as "18th Recruit Company," "Medical Department Training Company A," "Medical Department Training Units," "Medical Department Training Camp."

These recruits, drawn largely from the Medical Department recruiting stations attached to the department surgeon's office in Boston, and were medical

enlisted Reserve Corps men. They were organized into training companies by local orders. Though eight hours a day were devoted to drills and other instruction, the training was greatly handicapped by a shortage in trained instructors. Partially to overcome this, the most likely men were selected and given special training and made noncommissioned officers and used as instructors.

The training unit was abandoned the latter part of November, 1917, after the transfer of 129 men to Base Hospital No. 66, Tenafly, N. J. As the number remaining in the unit was too small to continue training to advantage, the remaining men were transferred to the permanent detachment of the Medical Department of the post hospital and the surplus noncommissioned officers were transferred elsewhere for duty.²¹

At Fort Strong a building was rented from the Long Island Hospital, at the nominal sum of \$1 per month, for the intensive instruction of selected Medical Department personnel of the coast defenses of Boston. Excellent results were reported by the department surgeon.²¹

The department surgeon, Central Department, stated in his annual report to the Surgeon General for the calendar year 1917, that practical school courses were instituted in accordance with a circular letter from the Surgeon General's Office, dated May 14, 1917, and was carried through in every detail with great credit to all concerned.²² He stated further:

Considering the frequent changes in both the commissioned and enlisted medical personnel and the fact that this personnel was largely composed of men new to the service, and the vast amount of work thrust upon them, their services were most gratifying to those charged with their training.

As no training school for Medical Reserve Corps officers was located on the Pacific coast, it became necessary immediately after the outbreak of the war for the department surgeon to prescribe a course of instruction, particularly in medical military subjects, in order that newly appointed officers might fit themselves for their new duties.

On account of the frequent changes in personnel it was not possible for any appreciable number of officers to complete any prescribed course, nevertheless, considerable progress and benefit was made in this connection. During the calendar year 1917, 2,059 enlisted men of the Medical Department were transferred to stations, camps, or regiments outside of the department on telegraphic orders from the War Department.²³

The department surgeon in reality ran a correspondence course for Medical Reserve and National Guard medical officers, as it was necessary to return several times in each case, for correction or completion, at least 75 per cent of the reports and returns received in the department surgeon's office. This was particularly true in regard to the sick and wounded reports and accounts for service or purchases from civilians.

The instruction in this department of so great a number of untrained enlisted personnel was greatly handicapped as was the case in all other departments, by the relatively small number of experienced officers and noncommissioned officers available as instructors. Nevertheless, by persistent effort prescribed courses of instruction were carried out as completely as was practicable, and as soon as they became qualified privates were promoted to noncommissioned grades.

CHAPTER V

TRAINING IN HOSPITALS

OFFICERS

GENERAL PROFESSIONAL TRAINING

The original assignments of medical officers to general and base hospitals were determined by the Surgeon General;¹ that is to say, efforts were made to assign a competent medical officer of the Regular Army to command each hospital with three or four experienced noncommissioned officers of the Medical Department for the training of the enlisted force and as a nucleus for an organization. Furthermore, in the original assignments of Medical Reserve officers to hospitals, those assigned in the various specialties were carefully selected from among officers known to be especially qualified.

The details of the training of this personnel in the early period of the war were left largely to the initiative of each commanding officer to carry out as best he could, and varied in extent with the availability and qualifications of instructors.² In all hospitals, even from the beginning, an effort at some military training was carried out, usually consisting of lectures on Army Regulations, Manual for the Medical Department, customs of the service, drill, guard duty, officer of the day duty, etc. Professional training and instruction was outlined and carried out in accordance with the instructions of the Surgeon General. It varied from the experience gained by the actual performance of duties, such as the assistance by junior officers to those already qualified, in the early period of the war, to very broad and complete courses of instruction which covered every phase of hospital work in the later period.

On account of the rapidly growing demand for Medical Department personnel for every variety of duty and the impracticability of training all so needed at the medical officers' training camps, it was necessary to order many officers and men direct from civil life to hospitals.³ This resulted in temporary overcrowding in some instances but was beneficial in that the staff was doubled and even tripled at times, thus making it possible to secure sufficient personnel, over and above that required for the routine duty in the hospital, to carry out schedules of instruction. It soon became apparent to the Surgeon General that a certain proportion of these officers were not being qualified for their duties as rapidly as was desired; therefore, in the fall of 1917 the following outline of instruction was forwarded to the commanding officers of base and general hospitals to be used as a basis for the training of officers:⁴

PROFESSIONAL TRAINING OF MEDICAL OFFICERS

ADMINISTRATION

Lectures by the commanding officer and such officers of the base hospital staff as have had previous experience and training in administrative subjects. These lectures to deal particularly with base hospital regulations and duties, with specific instruction in the duties of commanding officer, adjutant, registrar, mess officer, supply officer, commanding officer of detachments, and ward administration. Such courses of study and recitation will be prescribed in Army Regulations, Manual for the Medical Department, and other manuals as are necessary and practicable.

MEDICAL SUPPLY OFFICERS

1. The supply tables:
 - (a) Classification of supplies.
 - (b) Nomenclature of supplies.
 - (c) Normal allowance of various Medical Department units (pars. 474-476 and 842-959, Manual for the Medical Department, 1916).
2. Requisitions (pars. 474-495).
3. Transfer of medical supplies (pars. 496-500).
4. Accountability (pars. 501-503).
5. Distribution of field supplies in time of peace (pars. 504-506).
6. Distribution in zone of advance (see Field Service Regulations).
7. Replenishment in combat (pars. 551-554 and 858).
8. Returns of medical property (pars. 507-508).
9. Sales of medical property (pars. 509-510).
10. Distribution of medical property on abandonment of post (par. 511).
11. Use and care of medical property (pars. 512-526).
12. Base medical supply depots (pars. 782-786).
13. The advance medical supply depot (pars. 787-792).

INTERNAL MEDICINE (BY CHIEFS OF MEDICAL SERVICE)

This course of instruction is intended to familiarize medical officers serving with troops in the field with the more important diseases which they may encounter, their diagnosis, and the means of their prevention and treatment, with a view to securing prompt and suitable action when such cases arise. It is not the purpose of this instruction to make regimental officers hospital specialists, but to indicate to them their part in the teamwork of the Medical Department which will result in each sick soldier receiving promptly the best treatment, whether that be in the regimental field hospital, at the base hospital, or in general hospitals, and will make them most efficient in preventing the spread of disease among the troops.

I. Examination of recruits:

1. Methods of examination of the heart.
2. Principles of interpretation.
3. Causes for rejection.
4. Cardiovascular diseases which are most often overlooked in recruiting.
5. Border-line cases and difficult decisions.

II. Examination of the lungs.

III. Disorders of the heart common in soldiers:

1. The soldier's heart, symptoms, causes, prevention, treatment, including projected special hospitals, and prognosis, military, and individual. Emphasis on the importance of observations of recruits during training by regimental medical officers and overseas. The importance of a sufficient period for convalescence and retraining after acute infections; in particular, influenza, trench fever, and diarrhea.

IV. Tuberculosis in the soldier.

V. Lobar pneumonia. The newer knowledge of the fixed types of pneumococci, the means of determination of the type for specific treatment, treatment of Type I, infections by serum; symptoms and physical signs of pneumonia in the first few days and the importance of early diagnosis; prognosis in the different types.

VI. The acute respiratory infections, sore throats and diphtheria.

1. Importance of acute colds and bronchitis as forerunners of pneumonia; complications of acute respiratory infections, especially infection of the accessory sinuses and middle ear.
2. Tonsillitis, pharyngitis, etc. Importance of throat cultures in all cases; complications, especially acute nephritis, endocarditis, and other forms of streptococcus sepsis; importance of urine examination after tonsillitis before return to duty.

VI. The acute respiratory infections, sore throats and diphtheria—Continued.

3. Diphtheria, diagnosis, antitoxin treatment; carriers of the virulent and avirulent bacilli and modes of dealing with them. Carriers after an attack usually harbor bacilli in the tonsils and are even rendered free by tonsillectomy. The Shick reaction and its value in determining the need for immunization of a group of individuals.

VII. Epidemic meningitis and poliomyelitis:

1. Importance of epidemic meningitis among troops in camps and barracks.
2. Early symptoms and diagnosis.
3. Lumbar puncture and exact diagnosis.
4. Serum treatment, including strains of meningococci and bearing on failure of serum treatment as in the epidemic among Canadian and British troops early in the war.
5. Carriers and the great importance of their detection and isolation. Improved methods for the treatment of carriers.
6. A brief sketch of poliomyelitis with reference to the more acute forms and possibility of confusion with meningitis, either epidemic or tuberculous.

VIII. The exanthemata:

1. Measles; early diagnosis, especially Koplik spots; treatment and prevention with special reference to Colonel Munson's observations on sun and air.
2. German measles and its differential diagnosis from measles.
3. Scarlet fever; early diagnosis, prevention; the important complications in the throat, heart, kidneys, and joints; combined scarlet fever and diphtheria.
4. Typhus fever; modern knowledge of transmission by the louse; frequency in prison camps, etc.; symptoms and diagnosis of mild and severe forms; prevention.
5. Smallpox; recognition of mild cases of varioloid.

IX. The malarial fevers; mode of treatment and prevention:

1. Treatment of tertian malaria and of estivoautumnal with special reference to the need for continued use of quinine; treatment of pernicious malaria, intravenous and intramuscular use of quinine dihydrochloride.
2. The animal parasites, especially hookworm; treatment by oil of chenopodium; prevention.

X. Dysentery and diarrhea:

1. Bacillary dysentery; its causes, symptoms, treatment, and prevention.
2. Amebic dysentery; diagnosis and difference in symptoms from those of bacillary dysentery; treatment by emetine; importance of early treatment of acute stage; general treatment; amebic cysts and carriers.
3. The nonspecific diarrheas; causes, prevention, importance of treatment and safeguarding for a few days subsequently.

XI. Typhoid and paratyphoid fevers and trench fever:

1. Typhoid and paratyphoid with reference to modes of infection and importance of general prophylaxis. Specific immunization; diagnosis in the immunized; carriers.
2. Trench fever; its symptoms, diagnosis, wholly favorable prognosis, need for rest and for safeguarding during convalescence; theories as to causation and transmission.

XII. Nephritis, infectious jaundice, and tetanus:

1. Acute nephritis as seen at the Western Front.
2. Infectious jaundice and spirochetal infections.
3. Tetanus; its prevention; symptoms of mild tetanus; treatment by intraspinal antitoxin.

XIII. Gas poisoning; its symptoms, diagnosis, prognosis, and treatment.

SYLLABUS OF INSTRUCTION IN STANDARD METHODS FOR TREATING FRACTURES

The purpose of this course of instruction is to familiarize medical officers with standard methods in the treatment of fractures. It is intended that officers so trained will not only serve in the special fracture hospital, but in field, base, and general hospitals, and as regimental officers as well, so that a continuity in the methods for treating fractures can be maintained. By this means, it is proposed to establish teamwork on the part of medical officers throughout the Army, in order that the wounded soldier will receive promptly the most efficient treatment whether at the regimental aid station, the dressing station, the field hospital, the evacuation hospital, or the base hospital, as well as along the lines of transportation. The logical result of this cooperation will be to secure early recovery, lessen deformity, and reduce the number of soldiers permanently disabled to a minimum. It is realized that the exigencies of the service in the zone of the advance will frequently be such as to render the standard methods impracticable, but by indicating clearly the desideratum it is hoped that the difficulties in the field will act not so much as an obstacle but as a stimulus to the ingenuity of the medical officers.

Fractures in war are usually compound and will be much more prevalent than the simple, so that any treatment which considers merely the fracture and not the wound and the soldier would be quite ineffective. Consequently, the course of instruction will be initiated with a brief but thorough presentation of wounds, from a military standpoint, their causes, and their treatment. This will be followed by the course in standard methods for treating fractures proper. The instruction will be intensely practical in nature, consisting in the demonstration of the splints, their adaptability and application, and in clinics

CAUSES AND VARIETIES OF WOUNDS

1. Bullet wounds:
 - (a) Shrapnel.
 - (b) Rifle.
 - (c) Pistol.
2. Shell wounds:
 - (a) Shell fragments.
 - (b) Shell fuse.
 - (c) Hand grenade.
3. Bayonet wound; sword wound.
4. Burns.
5. Gas.
6. Varieties of wounds:
 - (a) Abrasion.
 - (b) Contusion.
 - (c) Laceration.
 - (d) Puncture; complete or incomplete.

CONDITION OF WOUNDED MEN

1. Hemorrhage, excessive (shock).
2. Exposure; wet, cold. Hunger.
3. Shell shock.
4. Gas.
5. Visceral injury; abdominal, thoracic and head.
6. Infection; pyogenic, tetanus, gas bacillus.
7. Suppuration.

TREATMENT OF WOUNDS

General:

1. Water administered—
 - (a) Mouth.
 - (b) Rectum.
 - (c) Hypodermoclysis.
 - (d) Intravenous. Dangers.
2. Food and hot drinks.
3. Medication.

Local:

1. Wound antisepsis—
 - (a) Excision, necrotic tissue.
 - (b) Wound cleansing, foreign body removal.
 - (c) Tincture of iodine.
 - (d) Dakin-Carrel method.
 - (e) Dichloramine-T.
2. Hemorrhage—
 - (a) Pressure by bandage. Cautions.
 - (b) Packed. Cautions.
 - (c) Tourniquet. Cautions.
 - (d) Ligation of artery. Cautions.
 - (e) Amputation. Indications.
3. Dressings—
 - (a) Dry antiseptic.
 - (b) Suture. Indications.
 - (c) Drainage. Indications.
4. Infection—
 - (a) Suppuration.
 - (b) Gangrene.
 - (c) Drainage.

FRACTURES

At the dressing station:

1. General treatment.
2. Wound antisepsis; 2 per cent iodine superficial.
3. Wound cleansing.
4. Immobilization and extension methods.
 - I. Fractures of the upper extremity—
 - (a) Simplest splint arm to chest.
 - (b) Screen wire and wood splints.
 - (c) If practicable, Thomas arm splint; elbow splint.
 - II. Fractures of the lower extremity—
 - (a) Rifle down the side of leg with coat between legs and the legs lashed together.
 - (b) Screen wire and wooden splints.
 - (c) C. femur. Thomas knee splint for fracture of femur. In fracture of femur, the soldier once placed on litter is not to be removed therefrom.
 - III. Fracture of rib. Immobilization.
 - IV. Fracture of pelvis. Fixation. Not removed from litter.
 - V. Joints.
5. Infections. Special treatment—
 - (a) Tetanus serum.
 - (b) Gas bacillus-aeration. Antitoxin.
 - (c) Pyogenic.
6. Amputations, contraindications. Indications.
7. Anesthesia.
8. Diagnosis tags. These must be kept up to date, particularly with fractures.

TRANSPORTATION

1. Cases sorted into transportable and nontransportable.
2. Maintenance of immobilization and extension, where practicable. Methods. Not more than 12 hours should elapse without the splint being inspected by a surgeon and necessary adjustments made.
3. Femur, special treatment for fractures of, in transit. Not to be removed from litter. Thomas knee splint inspected once every 12 hours.

EVACUATION HOSPITAL, SPECIAL FRACTURE HOSPITAL, BASE HOSPITAL

1. Early and adequate surgery.
2. Wound antisepsis.
3. Wound cleansing.
4. Conservation of fragments.
5. Immobilization and extension. Standard methods.
 - I. Fracture of upper extremity—
 - (a) Humerus.
 1. Jones's humerus extension splint.
 2. Jones's abduction splint.
 - (b) Elbow splint.
 - (c) Radius and ulna. Jones's forearm and wrist splint.
 - II. Fracture of lower extremity—
 - (a) Femur. Thomas knee splint; Hodgen splint, overhead suspension and extension from Balkan frame or on special fracture bed.
 - (b) Tibia and fibula. Jones's leg splint and Cabot splint.
 - III. Fracture of rib. Immobilization.
 - IV. Fracture of pelvis. Fixation. Bradford frame.
 - V. Joints. Operative indications. Foreign body removal. Drain.
6. Malunion and nonunion, caution; late tetanus and infection.
7. Infections; special treatment.
8. Operative treatment, indications for. Standard methods.
9. Amputation. Special.
10. Anesthesia. Ether drop method, chloroform; nitrous oxide; spinal, tropococaine.
11. Examinations, special methods:
 - (a) Roentgen ray.
 - (b) Bacteriological.
12. Massage and baking.
13. Hydrotherapy.
14. Curative workshop; reconstruction.

THORACIC WOUNDS

- I. Causes and varieties of wounds:
 1. Bullet wounds—
 - (a) Shrapnel.
 - (b) Rifle.
 - (c) Pistol.
 2. Shell wounds—
 - (a) Shell fragments.
 - (b) Shell fuse.
 - (c) Hand grenade.
 3. Bayonet wound, sword wound.
 4. Varieties of wounds—
 - (a) Laceration. Thoracic wall. Back.
 - (b) Perforating (puncture) wounds—complete, incomplete.
 - (c) Concussion of spinal cord—brachial plexus.
 - (d) Pseudo-perforating wounds.
- II. Pathology:
 1. Shock.
 2. Hemorrhage.
 3. Dyspnea.
 4. Hemoptysis.
 5. Vomiting and hiccough.
 6. Death, immediate causes of.

II. Pathology—Continued.

7. Infection—

- (a) Pyogenic.
- (b) Tetanus.
- (c) Bacillus—aerogenes.

8. Surgical emphysema.

III. Clinical aspects:

- 1. Pneumothorax.
- 2. Hemothorax.
- 3. Pyothorax (empyema).
- 4. Fracture of ribs.
- 5. Pneumonia.
- 6. Pleurisy—effusion.
- 7. Abscess and gangrene of lung.
- 8. Subphrenic abscess.
- 9. Pericarditis. Pneumocardium.
- 10. Paralysis—monoplegia, paraplegia.
- 11. Sequelæ.

IV. Treatment:

- 1. Immediate firing line, regimental aid, or dressing station—
 - (a) General care. Water. Hot drinks. Blankets.
 - (b) Wound antisepsis.
 - (c) Hemorrhage.
 - (d) Wound cleansing, if practicable.
 - (e) Dressing. Dry gauze, graduated pressure.
 - (f) Posture of patient—recumbent on affected side. If practicable not disturbed. No walking.
 - (g) Medication. Morphine. Atropine.
 - (h) Transportation. Rest one of main factors in treatment.
- 2. Intermediate. Regimental aid. Dressing station—
 - (a) General care. Food. Water. Hot drinks. Blankets.
 - (b) Wound antisepsis.
 - (c) Anesthesia. Chloroform; ether; drop method.
 - (d) Wound cleansing. Operation. Indication for. Foreign body, removal.
 - (e) Dressings. Immobilization of affected side—
 - 1. Fresh cases.
 - 2. Suppurative cases—
 - Dichloramine-T.
 - Carrel-Dakin.
 - Moist dressing.
 - (f) Medication.
- 3. Field hospital, evacuation hospital, base hospital—
 - (a) Examination, special methods—
 - Bacteriological.
 - Roentgen ray.
 - (b) Operations. Special methods. Indications.
 - (c) Suppuration; treatment of.
 - (d) Complications; special treatment for.

ABDOMINAL WOUNDS

I. Variety of wounds:

- 1. Contusions—
 - (a) Abdominal wall.
 - (b) Ruptured viscera, or blood vessels.
- 2. Puncture wound of abdominal wall (nonpenetrating).
- 3. Penetrating wounds (nonperforative of viscera, or blood vessels).
- 4. Perforating wounds.

II. Pathology:

1. Shock.
2. Hemorrhage.
3. Infection—
 - (a) Pyogenic.
 - (b) Tetanus.
 - (c) *Bacillus aerogenes*.
4. Protrusion of viscera.
5. Perforation, visceral.
6. Peritonitis.
7. Extraperitoneal infection.

III. Diagnosis. Early differential.

IV. Clinical aspects:

1. Hemorrhage.
2. Perforation of hollow viscus, early symptoms.
3. Extravasation, urine.
4. Peritonitis.
5. Abscess; subphrenic, perirenal; pelvis.
6. Septicemia.

V. Treatment:

1. Immediate, firing line, regimental aid, or dressing station—
 - (a) General care. Blankets. No water. No food.
 - (b) Wound antisepsis. Iodine.
 - (c) Dressings. Dry gauze.
 - (d) Posture of patient. On back, thighs flexed, head raised.
 - (e) Medication. Morphine.
 - (f) Transportation. Patient moved to adequate operating station as expeditiously as possible. Not removed from litter till operating station is reached.
2. Mobile operating unit, field hospital, evacuation hospital—
 - (a) Wound cleansing.
 - (b) Operation; methods and indications for.
 - (c) Anesthesia; ether, chloroform-drop method.
 - (d) Roentgen-ray examination.
3. Base hospital—
 - (a) Infections, special treatment for.
 - (b) Complications, treatment of.
 - (c) Roentgen-ray examination.
 - (d) Operations, methods and indications for.

OPHTHALMOLOGY

Instructions in ophthalmology should include the following-named subjects:

1. Methods of testing visual acuity.
2. Methods of testing pupillary reaction. Significance of pupillary abnormalities.
3. The simpler methods of testing the ocular rotations and the associated movements of the eye, including convergence.
4. External examinations:
 - (a) Method of everting the lids.
 - (b) Examination with oblique light. Especial attention to its importance in detecting abrasions of the cornea, corneal ulcers, the presence of small foreign bodies and iritic adhesions. Use of fluorescein.
5. Epiphora and its significance.
6. Inflammation of the lacrimal apparatus.

7. Inflammation of the lids and globe. In general, all cases of inflammation should suggest the following possibilities, arranged in the order of their importance:
 - Glaucoma.
 - Iritis.
 - Conjunctivitis.
 - Foreign body in the conjunctiva.
8. Trachoma and other contagious diseases of the conjunctiva.
9. Importance and significance of bacteriological examination in conjunctivitis.
10. Indications and contraindications for the use of mydriatics and miotics.
11. Wounds of the eye and orbital region.
12. The importance of a thorough examination in every case of injury of the globe.
13. The importance of X-ray examination in all cases when there is the slightest suspicion of the presence of a foreign body in the eye.
14. The use of magnets in military eye surgery.
15. Methods of testing and significance of increased intraocular tension. Glaucoma and its varieties.
16. Simple methods of determining the field of vision.
17. The significance of a double vision.
18. The causes of gradual and sudden loss of vision, with consideration of whether functional or organic.
19. Ocular malingering.
20. Eye symptoms in cases of increased intraocular pressure.
21. Ocular headaches, vertigo, and reflex gastric and nervous symptoms.
22. Ocular symptoms of disease and focal septic areas, as in alveolar abscess or sinusitis.

EAR

1. Foreign bodies in the canal.
 - Furunculosis of the canal.
 - Acute otitis media.
 - Acute mastoiditis.
 - Sinus thrombosis.
2. Chronic otitis media. Polypi.
 - Brain abscess.
 - Bárány tests for vestibular function.
 - Labyrinthitis.

NOSE AND THROAT

1. Acute and chronic tonsillitis.
 - Discussion of tonsil operations. Results of operations in preventing absorption.
 - Peritonsillar abscess.
 - Nasal obstruction.
 - Deviation of the septum. Submucous resection of the septum.
2. Acute and chronic sinusitis.
 - Antrum, frontal, ethmoid, sphenoid—polypi.
3. Epistaxis.
 - Fracture of the nasal bones.
 - Correction of external deformities of the nose.
 - Catarrh.
 - Atrophic rhinitis.
 - Syphilis of the nose and throat.
4. Acute and chronic laryngitis, papilloma of the larynx—cancer.
5. (Optional):
 - Direct inspection of the larynx and trachea.
 - Foreign bodies in the trachea and bronchi.
 - The direct examination of the esophagus.
 - Diseases of the esophagus: Stricture, pouch, cardiospasm, cancer.
 - Foreign bodies in the esophagus.

NEUROLOGICAL SURGERY

Skull—Fractures:

1. Varieties—

- (a) According to mechanism—bending, bursting, expansile.
- (b) Simple or compound.
- (c) According to form of fragments—fissured, linear, comminuted, diastasis, depressed, perforating, gunshot.
- (d) According to situation—vault, base.
- (e) Infection and complications.
- (f) Associated brain injuries.
- (g) Associated injuries to cranial nerves.
- (h) Associated injuries of blood vessels.
- (i) Associated injuries of nasal accessory sinuses.

2. Symptomatology.

3. Prognosis.

4. Diagnosis.

5. Treatment.

Meninges:

1. Physiology of cerebrospinal fluid.

2. Meningitis—

- Traumatic infective.
- Pathology and bacteriology.
- Symptomatology.
- Diagnosis.
- Prognosis.
- Treatment.

Brain:

1. Localization of function—

- (a) Exeitmotor cortex.
- (b) Sensory field.
- (c) Visual cortex.
- (d) Auditory cortex.
- (e) Olfactory cortex.
- (f) Cortical speech centers.

2. Craniocerebral topography.

3. Symptomatology of organic disease.

- (a) General symptoms.
- (b) Local symptoms.

4. Brain abscess—

- (a) Varieties.
- (b) Pathology.
- (c) Symptomatology.
- (d) Treatment.

5. Technic of intracranial operations.

6. Roentgenography and stereoroentgenography in intracranial disease.

Spine:

- 1. Surgical anatomy of vertebral column.
- 2. Normal and pathological physiology of the cord.
- 3. Localization in the cord.
- 4. Symptomatology of spinal disease—
 - Cell destruction.
 - Tract degeneration.
 - Root symptoms.
 - Sensory disturbances.
 - Motor weakness and paralysis.
 - Reflex disturbances.
 - Bladder and rectum.

Spine—Continued.

5. Variations in symptoms according to level.
6. The operative technique of laminectomy.
7. Extraction of foreign bodies.

Nerves:

1. Function—
 - (a) Motor.
 - (b) Sensory—epicritic, protopathic, deep.
2. Results of section of motor nerve.
3. Results of section of sensory nerve.
4. Nerve shock.
5. Diagnosis of nerve lesion (traumatic).
6. Technique of nerve suture.

PLASTIC AND ORAL SURGERY, SECTION OF SURGERY OF THE HEAD

1. Surgical anatomy of the face and jaws, bones, teeth, accessory sinuses, soft parts.
2. Sepsis: Special forms of sepsis related to mouth, face, and neck treatment. Peridental infection. Infection of antrum of Highmore and other nasal accessory sinuses.
3. Wounds and injuries of the face and jaws, with special consideration of injuries by projectiles.
4. Fractures of the jaw bones, with special reference to gunshot fractures. Displacements. Emergency treatment. Special care of patient, tissues, etc. Diet. Special methods of fixation, splints, etc.
5. Treatment of deformities of bony and soft tissues following gunshot injuries of face and jaws. Orthopedic splints. Plastic operations. Grafting of soft tissues, bone, and cartilage.
6. Local anesthesia in surgery of face and jaws.
7. Interpretation of dental and maxillary Roentgenograms.

FOOD AND NUTRITION

1. The scientific background of nutrition.
2. The dynamic effect of the different foodstuffs.
3. The influence of muscular work on metabolism.
4. Complete and incomplete proteins.
5. Accessory foodstuffs.
6. Governmental regulation of food.
7. Feeding of European armies.
8. Protection against spoilage of foods.
9. Gastric digestion in man.
10. Work of the food division, Surgeon General's Office.

ORTHOPEDIC SURGERY

1. (a) The human foot; its physiology, examination, and the significance of its symptoms. (b) The soldier's foot and the military shoe; prophylaxis. (c) The disabilities of the foot arising during military service and their treatment. (Synopsis: A review and an elaboration of the work done in these subjects in the course given in training camps.)

2. Injuries to joints and their treatment. (Synopsis: Also a review and elaboration of the preceding course.)

3. (a) Injuries to joints and their treatment. (b) Special joints—the knee joint, etc. (Synopsis: The general subject will be continued and elaborated, and the special peculiarities of the knee joint and other joints fully discussed.)

4. Positions of election for ankylosis. (Synopsis: The pathological changes leading to ankylosis and the clinical indications pointing to it will be fully explained. The positions of which the various joints are most serviceable will be definitely defined and the reasons for choice of these positions given.)

5. The operative procedures available for restoration of function following failure of repair after nerve injuries. (Synopsis: The difficulties involved in the repair of nerves will be fully discussed and the necessity for painstaking orthopedic care in order to secure a successful result after nerve suture emphasized. As alternative measures, where regeneration has failed to take place, tendon transplantation, tendon fixation, and certain bone operations are available, and their technique will be explained.)

6. Nonunion and malunion. (Synopsis: The various causes for nonunion and malunion will be reviewed and the operative procedures indicated discussed.)

7. Bone grafting. (Synopsis: The danger of operation, and particularly of bone operations, until all sinuses have been closed for at least six months will be strongly emphasized. The indications for bone grafting will be defined and the technique of the various procedures—spinal graft, inlay graft, bone peg—carefully explained.)

8. Methods of fixation—plaster of Paris. (Synopsis: The general principles of fixation will be discussed, and the use of plaster of Paris in military work will be fully covered.)

9. Methods of fixation—standard splints. (Synopsis: The standard splints will be demonstrated and their indications and use carefully explained.)

10. Methods of fixation—nonstandard splints. (Synopsis: Other splints and improvised splints will be demonstrated and their indications and use explained.)

TUBERCULOSIS IN THE SOLDIER

Signs of active lesion. The acute lesion. The chronic lesion; activity in chronic lesions; distinction between acute and chronic lesions by physical signs. Distinction by X ray; bronchopneumonic focus; diagnosis of large lesions, isolated or few in number; tuberculous pneumonia; development of caseous lesions; physical signs of tuberculous pneumonia in first stage, in stage of consolidation; cavity signs; recent cavitation; old and dry or nearly dry cavities. Disseminated tuberculosis; miliary (vascular) disseminations. Peribronchial tuberculosis; physical signs; varieties and prognosis; X-ray diagnosis.

Physical examination in tuberculosis.—Necessity of objective examination in military practice. Importance of cough as aid to diagnosis. Topical variations in physical signs in the normal lung. Marginal sounds. Diagnosis by auscultation; breath changes and their significance; kinds and significance of râles. Rôle percussion plays in diagnosis of chest conditions. Voice transmission; transmission of whisper.

Detection of tuberculosis among soldiers.—Repeated weighing of recruits; those losing weight under training to be specially examined. Tuberculosis usually discovered during an exacerbation; distinction between exacerbation of chronic tuberculosis and incipient active tuberculosis. Rôle of X ray in the diagnosis of tuberculosis. Question of line of duty (Circular 23, Surgeon General's Office, and its interpretation). Infection between adults. What is the danger, if any, of spread of tuberculosis among soldiers from contact with tuberculosis individuals? The hygiene of the tuberculous patient; feeding; indications for rest and exercise; hardening methods.

Examination of the lungs.—Stethoscope; necessary to have a stethoscope which fits the ears; Ford stethoscope; phonendoscope not to be used for routine work. Position of patient during examination. Steps in examination. Inspection; general appearance of patient; general shape of chest; retractions; lagging; diminished expansion; apex beat of heart; pericardial pulsation. Palpation; vocal fremitus; normal variations. Percussion; method; light percussion best; normal variations; outlining of apices by Kronig's method; next to percuss from below upward, comparing sides. Auscultation; best to auscultate from below upward, comparing sides; vocal resonance; normal variations; even pressure of stethoscope necessary; whispered voice transmission; normal variations; breath sounds; instructing patient how to breathe; absence of breath sounds; feeble breathing; rough breathing; harsh breathing; prolonged breathing; normal variations; auscultation from trachea; normal disparity between right and left apex; transmission of breath sounds from trachea; normal disparity between right and left apex; pulmonary râles; extra pulmonary sounds simulating râles; classification, crackling, bubbling (so-called moist or suberepitant râles), sibilant and sonorous râles; gurgling râles; consonating râles; cavity râles; pleural râles. Value of "expiration and cough" in eliciting râles. Check up one phase of the examination with the other. Value of the localization and locality of physical signs.

As much as possible of the instruction outlined above was to be given in connection with the daily hospital routine; set classes and instruction were not to interfere with the efficiency of the hospital work.⁵

As stated above, the officers assigned to hospitals and in the various specialties, by War Department orders were carefully selected.² With few exceptions they were competent in their accredited work, but they were required to perform many other duties in the hospitals in order that they might develop into well-trained and finished medical officers.² The course of instruction quoted above was sufficient to render these medical officers capable of performing the multifarious and important duties of their positions; however, in December, 1917, it became apparent to the Surgeon General that a certain proportion of them were still not fully qualified.⁶ The disqualification was due, in most instances, to physical disability, mental incapacity, temperamental unfitness or slothfulness, or to lack of education or proper training. In some instances, it was only apparent or relative and due to the fact that the individual was for the time being assigned to duty for which he was not adapted.

In order to eliminate from the service officers who were incompetent because of actual physical or mental incapacity, and in order that those incompetent from other causes might be made competent or eliminated, the Surgeon General directed that commanding officers of base and general hospitals list all subordinates whose work was not reasonably good, inform them of the directions of the Surgeon General, make inquiry into each case as to why the work performed was not satisfactory, and to take such of the following steps as was considered necessary.⁷ All those suspected of mental incapacity were to be given a psychological examination on the lines and forms prescribed by the Surgeon General. The mentally capable men were to be tried in assignments other than those in which they had failed in their examinations. Arrangements were to be made with division surgeons and commanding officers of adjacent base hospitals for the temporary exchange of officers, in order that those failing in ward work might have a chance with a field or hospital unit. However, no man was to be exchanged as incompetent until his superior officer certified that he had personally given the man proper instruction in technique and was convinced that the man was not capable of becoming competent in that line of work within a reasonable time. The men exchanged were to be given proper instruction in the methods and details of this new work, and were to be assisted in its performance for a reasonable time so as to be saved to the service whenever possible. Those who, by reason of physical or mental incapacity, viciousness, or laziness, could not be made qualified were to be ordered before a board of officers convened for their discharge from the service under the terms of Bulletin No. 32, War Department, May 24, 1917, paragraph 9, and reported to the Surgeon General as unfit for the military service. Officers found unsuitable for hospital work, but who were qualified for field work were to be reported to the Surgeon General, with recommendations for their transfer to divisions.

INSTRUCTION FOR SUBSTANDARD OFFICERS

The course of instruction prescribed by the Surgeon General on November 1, 1917, for medical officers in hospitals proved too advanced for the effective correction of incompetency, due to defective medical education and lack of knowledge of the basic technique of medical or medicomilitary practice. Therefore, another and simpler course was indicated and prescribed, as given below by the Surgeon General, for officers falling in this category, the idea being to secure for the service every man capable of developing into a useful officer.⁷

* * * * * *

(a) Clinical training will be given each day as follows, unless circumstances render a change advisable. Attendance is compulsory.

Monday: Chest clinic, one hour. Discussion of cases and of manner of their investigation and presentation.

Tuesday: Surgical clinic, one hour. Discussion as above.

Wednesday: Diseases of digestive system clinic. Discussion as above.

Thursday: Fractures and orthopedic clinic. Discussion as above.

Friday: Psychiatric, neurologic, ductless glands clinic. Discussion as above.

Saturday: Medical or surgical, bone and joint clinic. Discussion as above.

(b) Instruction should be given to individuals or to classes small enough to permit of individual instruction by chiefs of service as follows, attendance being compulsory on the part of all substandard men.

Monday (by chief of medical service): On routine and thorough methods of physical examination and history writing.

Tuesday (by chief of surgical service): Similar instruction in relation to surgical cases.

Wednesday (by director of laboratory): On laboratory aids to the ward surgeon; what may be expected from the laboratory, how it may be obtained, what it may mean; preparation of patient.

Thursday (by director of X-ray laboratory): On X-ray aids which may be expected, how obtained, what it may mean; preparation of patient.

Friday (by adjutant or registrar): Preparation and disposal of hospital records. Importance of them and of their completeness.

Saturday: Repetition of most-needed instructions.

(c) Officers of known incapacity or doubtful capacity will, so far and so long as it is possible, be assigned to base hospitals or other units in excess of the quota of real necessity for the purpose of the above instruction and will while there be under constant instruction and will do a full day's work each day under the supervision of an officer of known capacity.

No definite period is set for this training of substandard men to remedy their defects and determine their competence. It should be continued so long as they apparently profit thereby. But an officer who at the end of six weeks of intensive instruction does not give promise of reasonable competence at an early date is not worth continuing in the service.

INSTRUCTION FOR OVERSEAS HOSPITAL PERSONNEL

Previous to this time the personnel of base and evacuation hospitals organized for overseas service had been assigned to military and civilian hospitals adjacent to place of mobilization. Here the personnel in groups of practicable size were given professional instruction in the various departments of the hospitals. In May, 1918, however, it was realized in the Surgeon General's Office that, if the hospital units being organized for our overseas service were to render efficient service when they arrived in France, it would be necessary for both officers and enlisted men to be assigned to hospital work in military hospitals in the United States and continued at this work until ordered overseas.⁸ The policy was therefore developed to send the personnel of these overseas hospital units to general and base hospitals in this country and to assign both

officers and enlisted personnel, except such as were necessary for the administrative functioning of the unit, to temporary duty in base hospitals. In accordance with this policy, overseas hospital units were sent to practically all the large camps on May 3, 1918. On departure of these units others were ordered to the camps to take their places.

SPECIAL COURSES FOR OFFICERS

During the late summer and fall of 1917, schools were established in the important medical centers of the United States for the intensive training of medical officers in the specialties of medicine and surgery. The most important of these were schools of fractures and war surgery, including the Carrel-Dakin method of treating war wounds; oral and plastic surgery; orthopedic surgery; neurosurgery; psychiatry; cardiovascular disease; diagnosis and treatment of pneumonia and tuberculosis. Selected medical officers, recommended by the commanding officer of hospitals were ordered to these schools for courses of intensive instruction, at the completion of which they were ordered back to the hospitals, where they acted as instructors in these specialties to the permanent personnel and to those assigned for instruction.

On November 30, 1917, the Surgeon General sent to hospitals a syllabus containing abstracts of the latest literature of war surgery. Primarily, these abstracts were designed as a basis for the lectures provided for in the Surgeon General's circular letter of November 1, 1917.⁴ The syllabus, supplemented by lantern slides and moving pictures, was forwarded to the principal hospitals in turn. The first pictures sent out were on the treatment of war wounds, the application of splints, and the treatment of burns; many others were prepared and sent out as they became available.⁹

Journal clubs were inaugurated in many of the hospitals and professional papers were prepared and read by members at the meetings of the club, and clinical demonstrations of interesting cases were made. These clubs in many instances served to stimulate and hold the interest of the medical officers and proved of value in disseminating information.¹⁰

In the cantonment hospitals the professional instruction as prescribed by the Surgeon General was open to all medical personnel of the camp, including that of the divisions in training at the camps.

In the summer of 1918, in compliance with instructions from the Surgeon General,¹¹ selected enlisted men of long service and of proved character, and some of the new men who were suitably qualified, were assigned as assistants to the headquarters, registrars, and mess officers of base, general, and other hospitals and were given intensive instruction in these duties for the purpose of training them for commission in the Sanitary Corps, to fill vacancies for those positions in the base and evacuation hospitals for overseas service.

Weekly meetings were held between the commanding officers, the chiefs of services of base hospitals, and all the regimental surgeons, within the area from which the hospitals drew the sick, for the purpose of conferences upon all matters pertaining to admission discharge from the hospitals, and the further general improvement and cooperation of the two branches of the medical service.¹²

When the base hospitals and the general hospitals had become thoroughly organized, many of them became educational centers, where post-graduate medi-

cal schools were conducted, not only for the training of the local medical officers on duty in the hospitals thereof and the hospitals and other medical units in the cantonment, but also for medical officers ordered to these hospitals for courses of instruction from other stations. The courses of instruction given in these institutions usually included the special branches of medicine and surgery, and instruction in the duties of the chiefs of the various services of base and general hospitals. Courses of instruction were also conducted for nurses and enlisted men.¹³

The following courses were given in a base hospital in the late summer of 1918:¹⁴

1. Six weeks' post-graduate school for the officers (one clinic and one lecture daily).^a
2. A course of instruction to the regimental surgeons in training in the camp and base hospital work, the administration of the base hospital and coordination of the duties of a regimental surgeon with the base hospital.^a
3. School for instruction in the diagnosis and treatment of pneumonia.
4. Two lectures weekly to nurses.^a
5. A course in laboratory technique by the chief of the laboratory and his assistants.^a
6. A course in operative and surgical technique for enlisted men.^a
7. Instruction in social hygiene.
8. School of hygiene and sanitation.
9. Courses for the training of chief of surgical services, 30 days.
10. Courses for the training of chief of medical service, 30 days.
11. Instruction for chiefs of laboratories.

OUTLINE OF COURSE FOR CHIEFS OF SURGICAL SERVICE

(a) Relation to hospital administration (6 days):

1. The commanding officer.
2. The adjutant.
3. The ward officer.
4. The detachment.
5. Supplies and property.
6. Notification officer.

(b) Records and reports (2 days, and incidental instruction):

1. The registrar—
 - a. Reports, hospital.
 - b. Filing and indexing of records.
2. The supervisor of records—
 - a. Medical importance to patient.
 - b. Medico-legal value to Government and soldier.
 - c. Statistical importance.
3. Administrative officers—
 - a. Efficiency and rating of officers.
 - b. Efficiency and rating of men.

(c) Special boards and committees (2 days, and incidental instruction):

1. Hospital efficiency board.
2. Disability board—
 - a. Line of duty.
 - b. Surgeon's certificate of disability.
 - c. Limited military service.
3. Consultation board.
4. Aviation and other special boards.
5. Testimony before courts and boards.

^a Training exemplified in previous pages of this chapter.

- (d) Sanitation (2 days):
 - 1. General hospital sanitation.
 - 2. The messes—
 - a. Food.
 - b. Conservation.
- (e) Military instruction (daily):
 - 1. Drill and setting-up exercises (30 minutes).
 - 2. Military courtesies; Manual for Medical Department; Army Regulations; Manual for Courts-Martial; lectures and recitations (30 minutes).
- (f) Organization of the surgical service:
 - 1. Duties of chief of service.
 - 2. Duties of assistants to chief.
 - 3. Duties of ward surgeons.
 - 4. Duties of operating teams.
 - 5. Relations of surgical department—
 - a. Genitourinary.
 - b. Orthopedic.
 - c. Otolaryngological.
 - d. Oral and plastic.
 - 6. Conferences, consultations, clinics, and lectures.
- (g) Surgical objects:
 - 1. Registrants and soldiers in training—
 - a. Rejections of unfit.
 - b. Detection of malingerers.
 - c. Fitting of men—
 - (1) Operative.
 - (2) Nonoperative—
 - (a) Orthopedic.
 - (b) Training in convalescent camp.
 - d. Selection of operation procedures.
 - e. Time and training in convalescence.
 - f. Refusal of operation.
 - 2. Wounded—
 - a. Steps in their care.
 - b. The base hospital.
 - c. The general hospital.
 - 3. Reconstruction—
 - a. Surgical.
 - b. Training.
- (h) Technical problems:
 - 1. Operative technique—
 - a. Preoperative care.
 - b. Postoperative care.
 - 2. Operating teams—
 - a. Operator.
 - b. Assistants.
 - c. Anesthetist.
 - d. Nurses.
 - e. Corps men
 - 3. Sepsis—
 - a. Clinical instruction.
 - b. Courses in antisepsis.
 - 4. Special wounds—
 - a. Didactic instruction.
 - b. Clinical instruction if wounded are returned to hospital from France.

(i) Management of the patients:

1. Admission—
 - a.* Distinction and grouping.
 - b.* Isolation of infections.
2. Discharge—
 - a.* Command.
 - b.* Convalescent camp.
 - c.* Limited military duty.

OUTLINE OF COURSE FOR CHIEFS OF MEDICAL SERVICE

* * * * * *

(f) Organization of the medical service:

1. Duties of chief of service:
2. Duties of assistants to chief.
3. Duties of section supervisors.
4. Duties of ward surgeons.

(g) Methods:

1. The staff—
 - a.* Staff conferences.
 - b.* Individual conferences.
2. The service—
 - a.* Classification and assignment of patients.
 - b.* Discharge of patients.
 - c.* General medical cases.
 - d.* Cardiovascular cases.
 - e.* Lung cases.
 - f.* Neuropsychiatric cases.
 - g.* Communicable diseases.
 - h.* Convalescents.
 - i.* Out-patients.
 - j.* Reconstruction.

(h) Consultation:

1. System.
2. Recording.

(i) Medical instruction—

1. Individual.
2. Clinics, lectures, conferences, digests of medical lectures, etc. (to be conducted by student officers so far as possible).

* * * * * *

(f) Organization of the laboratory:

1. The central laboratory and ward laboratories.
2. Relation to chiefs of service and ward surgeons.
3. Administration of laboratory personnel.
4. Care of instruments and supplies.
5. Keeping of records.
6. Routine work, including—
 - a.* Bacteriology and animal parasites.
 - b.* Serology, Wassermann's, etc.
 - c.* Chemical analysis, urinalysis, and various chemical tests.
 - d.* Test on blood, exudates, etc.
 - e.* Pathological anatomy, gross and microscopical.
 - f.* Post-mortems.
 - g.* Preparing media.

(g) Work, in cooperation with the camp sanitary officers, in the control and prevention of disease, including:

1. Examinations of organizations for carriers of typhoid, meningococcus, malaria, etc.
2. Analysis of water, milk, and various foods.

- (h) 1. Relation of laboratory to department laboratory.
 2. Relation of laboratory to Army Medical School.
 3. Relation of laboratory to Army Medical Museum.

NURSES

The Army Nurse Corps personnel of general and base hospitals were assigned thereto by the Surgeon General. In so doing, an effort was made to select a certain number of nurses who were especially skilled in operating-room technique, the administration of anesthetics, in fracture work, orthopedics, etc., the idea being to use them as instructors for other nurses as well as instructors for enlisted men. This was not always possible, however, and many had to receive their special instruction from practical experience and from medical officers on duty in the hospitals after their assignment thereto.

In some of the hospitals a general course of lectures was outlined and given by the medical officer staff. The following is an example of such a course of general instruction.¹⁵ Two lectures per week were given on Tuesdays and Thursdays for 10 weeks. The lectures covered the period 6.45 to 7.15 p. m.

Tuesday, April 2. Lecture 1: Military point of view in regard to patients.

Thursday, April 4. Lecture 2: Camp sanitation.

Tuesday, April 9. Lecture 3: Typical infectious diseases in this war—enteric fever, dysentery, trench fever, infectious jaundice, malaria.

Thursday, April 11. Lecture 4: Meningitis.

Tuesday, April 16. Lecture 5: Pneumonia.

Thursday, April 18. Lecture 6: Carriers and contacts and their control; and

Tuesday, April 23. Lecture 6: Carriers and contacts and their control—Shick tests, vaccines, isolation periods.

Thursday, April 25. Lecture 7: Character of war wounds; transport from field to base.

Tuesday, April 30. Lecture 8: Operating-room technique.

Thursday, May 2. Lecture 9: Dakin's solution and antiseptics.

Tuesday, May 7. Lecture 10: Preparation and administration.

Thursday, May 9. Lecture 11: Fractures and splints.

Tuesday, May 14. Lecture 12: Infection of wounds.

Thursday, May 16. Lecture 13: Hemorrhage and shock; abdominal wounds.

Tuesday, May 21. Lecture 14: Chest wounds and gas poisoning.

Thursday, May 23. Lecture 15: Utilization of men unfit for active field service, graduated exercises, etc.

Tuesday, May 28. Lecture 16: Shell shock.

Thursday, May 30. Lecture 17: Orthopedics.

Tuesday, June 4. Lecture 18: Care of ear and nose cases.

Thursday, June 6. Lecture 19: Adaptation of field ration to special cases.

STUDENT NURSES

The establishment of the Army School of Nursing was authorized by the Secretary of War, May 25, 1918.^b The plan of the school provided that it should be known as the Army School of Nursing and should be located in the Surgeon General's Office. The course of training to be given in the various base hospitals, each hospital to be a composite unit having its own director, its staff of lecturers, instructors, and its teaching equipment—the course to lead to a diploma in nursing and extended over a period of three years. At the

^b For further details, see p. 441.

time of the signing of the armistice, 5,267 students had been accepted and were on duty in 25 military hospitals.

The course of study and the routine work in wards was in accordance with the requirements of the standard curriculum of schools of nursing, issued by the National League of Nurses in 1918. The time allowed the various subjects was divided between lectures by members of the Army medical staff and class quizzes, laboratory work, and demonstration by qualified nurse instructors.

These student nurses were also given instruction in drill, members of the student companies exercising the function of commissioned and noncommissioned officers.

NURSE ANESTHETISTS

In the fall of 1917, in order to supplement the number of skilled anesthetists in the Army, a number of women contract surgeons were appointed and assigned to duty in general and base hospitals for the purpose of instructing Army nurses in the administration of anesthetics.¹⁶ In most of the hospitals courses were inaugurated, and instruction in this subject was given to certain officers, nurses, and enlisted men.

In August, 1918, a questionnaire was sent to the commanding officers of all base and general hospitals by the Surgeon General. The object of this questionnaire was to gather information concerning the number of skilled anesthetists on duty in each hospital; the types of anesthetics they were qualified to administer; the availability of adequate equipment; whether instruction had been given to officers, nurses, or enlisted men or contract surgeons; other pertinent information.¹⁷

On September 23, 1918, the following letter was sent from the Surgeon General to all commanding officers of hospitals.¹⁸

The division of general surgery has completed plans directed toward strengthening the department of anesthesia in the various military hospitals.

These plans contemplate both improving the administration of anesthetics and assuring a constant supply of anesthetists developed by systematic courses of instruction to commissioned officers, nurses, and enlisted personnel.

It is imperative that every chief of surgical service through the commanding officer should cooperate intensively with the division of general surgery in building up a strong department of anesthesia, in order to guarantee adequate service to the surgical patients, both in the United States and overseas forces.

* * * * *

The duties of the anesthetist shall consist in: (a) Supervision of administration of anesthesia and personal administration when desired or when requested by chief of surgical service. (b) Instruction of commissioned officers, nurses, and enlisted personnel in the fundamentals of anesthesia (pharmacology and physiological action of anesthetics), the art of administration, post anesthetic care and sequelæ, and the indications for and technique of resuscitation.

Instruction will be confined to the use of the open drop-ether and the gas-oxygen methods in the order named. Gas-oxygen should not be taught until ether administration is mastered, and every means should be utilized to emphasize the gravity, difficulties, and dangers of gas-oxygen anesthesia.

This office has been specially requested by the chief consultant in surgery, A. E. F., to group nurse anesthetists into two separate classes: (1) Those who are skilled in drop-ether method and (2) those who are skilled in gas-oxygen.

The length of the course of instruction should not cover more than six weeks. It need be no longer than the aptitude of the pupils demands. Classes should be limited to six pupils so that instruction may be intensive.

As soon as a pupil is found to be qualified, this office should be notified (the form of monthly report to be used is inclosed), and his place as pupil filled by another officer, nurse, or enlisted man selected by the chief of the surgical service. In this way, it will be possible to furnish the overseas forces a constant supply of competent anesthetists, while maintaining a high degree of perfection in anesthetic administration in the United States hospitals.

The supply division of the Surgeon General's Office has arranged to send you a sufficient number of tanks to guard against any interruption in the supply of nitrous oxide or oxygen. You should send tanks to be refilled before your reserve supply is compromised. You are to send your tanks to * * * for refilling.

If one of the gas machines requires repair that can not be made locally, immediate exchange should be arranged through the medical supply depot at New York and the division of general surgery notified.

On the 1st of every month a report made out by the anesthetist should be forwarded through military channels to this office, attention division of general surgery. The report should be made in accordance with the inclosed sample blank, copies of which will be furnished you. It is particularly urged that full, explanatory remarks be noted in the column marked "Remarks." All data on this report pertaining to nurses should be submitted to the chief nurse for her guidance. This report does not substitute for the efficiency report rendered by the chief nurse.

ENLISTED MEN

The basis for the instruction and training in general of enlisted men of the Medical Department was laid down in the Manual for the Medical Department, Drill Regulations for Sanitary Troops, and Mason's Handbook. Commanding officers of units and detachments were given great latitude in the choice of ways and means for training their personnel, and were held correspondingly responsible for the results obtained. These instructions were augmented from time to time by circular letters sent out by the Surgeon General and by department surgeons. The wide scope of the duties performed by the enlisted personnel of these hospitals necessitated a specialization which generally prevented a comprehensive course of instruction for the personnel as a whole.

Many of the base hospitals had their beginning in the small post hospitals, the personnel being increased as expansion of the hospital occurred, and it was generally the case in the early days of organization that the personnel was so small in proportion to the number of patients in the hospital to be cared for, that instruction was limited to vital requisites and consisted of hardly more than the practical experience gained in the general routine duties performed. As the personnel increased coincidentally with the growth and formation of new departments in their organization in the hospitals, it was found that many technically qualified men could be found in the classification of the personnel who could be assigned directly to services, where they functioned satisfactorily without further training throughout the existence of the hospital.¹⁹

Instruction was largely carried out in separate departments of the hospitals and in the main was based on the practical performance of work under the guidance of those responsible for the given department. In this way, large numbers of men, both privates and noncommissioned officers, were trained in special work and made available for the formation of additional units for service at other near-by organized hospitals.

Beginning in the spring of 1918, small detachments of enlisted men under the charge of an officer were assigned to several carefully selected hospitals in Philadelphia, New York, and other places for special training in hospital work.²⁰ These detachments were largely used for assignment to hospital units for overseas service. As each detachment finished its training, or was called to rejoin its organization, another detachment was ordered to take its place.

In some hospitals, for the purpose of training the enlisted personnel, the detachment was divided into five groups, one group being designated for instruction for a certain number of hours each day of the week except Saturday, until each group had covered the entire course.²¹ In other hospitals similar methods were employed, the detachment being divided into eight or nine groups. The following is an example of such a schedule of instruction:²²

	Monday	Tuesday	Wednesday	Thursday	Friday
1 to 2 p. m.	Drill	Drill	Drill	Drill	
5.30 to 6.30 p. m.	School of soldier; personal and field hygiene	Property and property responsibility	First aid and bandages	Nursing	Minor surgery and first aid
6.30 to 7.30 p. m.	Paper work		Ward management	Litter drill	Army Regulations

The following quotation was taken from the annual report of the commanding officer of the base hospital, Camp Custer, Mich., for the year of 1918:²³

Enlisted personnel.—Much attention has been paid to the development of an esprit de corps among enlisted personnel. The personnel was organized into six companies under detachment commander and his assistants, each company directly in charge of a sergeant. Competition between companies has been encouraged, both as to effectiveness in drill and in care of barracks. Barracks are all cubicled with sheets, floors oiled, and individual shelving is being installed as fast as time permits. Instruction has also been given in professional care of patients in wards, various courses having been outlined, based on Mason's Handbook, with modifications after detailed study by medical officers. This teaching has been carried on in wards under the direction of ward surgeons, who have been encouraged to take a personal interest in the teaching of his individual ward personnel. The precise lesson for each day has been indicated and maintained uniformly over the hospital so that when a man was transferred from one ward to another his instruction might go on without interruption. Night men have been instructed together, gathering for the purpose one-half hour before going on duty. Classes in typewriting have been successfully maintained, and soldiers unable to speak or write English have been placed in classes and taught until able to do so. There have been 526 men trained in this detachment and transferred to other organizations and overseas. From time to time the hospital has received additional increments from draft and from the depot brigade. Many of these men were transferred to the hospital detachment because of their demonstrated unfitness for other organizations. A large number of these, however, have been salvaged and after training have proved to be valuable members of the detachment. Others, such as the insane and the crippled, had to be discharged.

In many base and general hospitals schools for noncommissioned officers were established for purposes of instruction of noncommissioned officers, selected privates, and privates first class, having the necessary qualifications

to fit them for the various grades of noncommissioned officers. The following schedule is an example of the noncommissioned officers' course.²⁴

The following hours of instruction for each week, places of instruction, and subjects are designated, beginning Monday, January 21:

Monday	Tuesday	Wednesday	Thursday	Friday
1 to 2 p. m.	11 a. m. to 12 m.	11 a. m. to 12 m.	11 a. m. to 12 m.	11 a. m. to 12 m.
Care of sick; first aid; minor surgery. At hospital	Army Regulations; Manual of Medical Department. At adjutant's office	Property accountability. At property office	Paper work. At sergeant major's office	Pharmacy. At dispensary

Men were selected from time to time from the detachment for the school. Those found unsuitable were promptly relieved.

Special courses of instruction were inaugurated in many of the hospitals for the training of selected enlisted men for various special lines of hospital work, such as operating room and surgical assistants, dental assistants, laboratory assistants, X-ray assistants, anesthetists, dispensary assistants, and ward masters. The following is an example of a schedule of instruction for ward masters and surgical and dispensary assistants. In many of the camps the enlisted men from the field units of the divisions were required to attend these courses of instruction.²⁵

SCHEDULE OF INSTRUCTION

For specially selected men at the base hospital in duties of ward master, surgical and dispensary assistants.

In addition to the hours specified below, a minimum of five hours daily will be required to be spent in practical work in the wards, dispensary, and dressing rooms.

Thursday, Nov. 1:

- 10.30 to 11.30... First aid: Contusions and wounds.
- 1.15 to 2.15..... Nursing: The ward; duties of ward master and nurses.
- 2.30 to 3.30..... Minor surgery: Anesthesia, general and local.

Friday, Nov. 2:

- 10.30 to 11.30... First aid: Hemorrhages.
- 1.15 to 2.15..... Nursing: Ward management and diets.
- 2.30 to 3.30..... Minor surgery: Operating assistants, duties of.

Monday, Nov. 5:

- 10.30 to 11.30... First aid: Dislocations and sprains, diagnosis and treatment of.
- 1.15 to 2.15..... Nursing: Beds and bed making; actual demonstration of.
- 2.30 to 3.30..... Minor surgery: Operating assistants, duties of.

Tuesday, Nov. 6:

- 10.30 to 11.30... First aid: Fractures.
- 1.15 to 2.15..... Nursing: Baths and bathing.
- 2.30 to 3.30..... Minor surgery: Minor operations.

Wednesday, Nov. 7:

- 10.30 to 11.30... First aid: Fractures and treatment of.
- 1.15 to 2.15..... Nursing: Enemata, irrigations, and catheterization.
- 2.30 to 3.30..... Minor surgery: Review.

Thursday, Nov. 8:

- 10.30 to 11.30... First aid: Foreign bodies, ear, eyes, nose, and throat.
- 1.15 to 2.15..... Nursing: External applications.
- 2.30 to 3.30..... Minor surgery: Adhesive straps and strapping.

Friday, Nov. 9:

- 10.30 to 11.30... First aid: Heat and cold, effects of.
- 1.15 to 2.15..... Nursing: Temperature, pulse, and respiration.
- 2.30 to 3.30..... Minor surgery: Splints and immobilization of fractures.

Monday, Nov. 12:

- 10.30 to 11.30... First aid: Insensibility, causes and diagnosis of.
- 1.15 to 2.15..... Nursing: Symptoms, subjective and objective.
- 2.30 to 3.30..... Minor surgery: Surgical dressings.

Tuesday, Nov. 13:

- 10.30 to 11.30... First aid: Convulsions.
- 1.15 to 2.15..... Nursing: Clinical records.
- 2.30 to 3.30..... Minor surgery: Preparation of patient and instruments.

Wednesday, Nov. 14:

- 10.30 to 11.30... First aid: Asphyxia, artificial respiration.
- 1.15 to 2.15..... Nursing: Bandages and bandaging.
- 2.30 to 3.30..... Minor surgery: Review.

Thursday, Nov. 15:

- 10.30 to 11.30... First aid: Poison.
- 1.15 to 2.15..... Nursing: Bandages, demonstrations of.
- 2.30 to 3.30..... Materia medica and therapeutics: Drugs.

Friday, Nov. 16:

- 10.30 to 11.30 .. First aid: Poisoning, treatment of.
- 1.15 to 2.15..... Nursing: Bandages and bandaging.
- 2.30 to 3.30..... Materia medica and therapeutics: Drugs, Army supply table.

Monday, Nov. 19:

- 10.30 to 11.30... Pharmacy: Definitions.
- 1.15 to 2.15..... Nursing: Infection and disinfection.
- 2.30 to 3.30 .. Materia medica and therapeutics: Drugs.

Tuesday, Nov. 20:

- 10.30 to 11.30... Pharmacy: Pharmaceutical operations.
- 1.15 to 2.15..... Nursing: Infection and disinfection.
- 2.30 to 3.30..... Materia medica and therapeutics: Drugs, active principles of.

Wednesday, Nov. 21:

- 10.30 to 11.30... Pharmacy: Official preparations.
- 1.15 to 2.15..... Nursing: Infection and disinfection.
- 2.30 to 3.30..... Materia medica and therapeutics: Active principles and classification of.

Thursday, Nov. 22:

- 10.30 to 11.30... Pharmacy: Nonofficial preparations.
- 1.15 to 2.15..... Nursing: Instruments and appliances.
- 2.30 to 3.30..... Materia medica and therapeutics: Administration of medicines.

Friday, Nov. 23:

- 10.30 to 11.30... Pharmacy: Making preparations.
- 1.15 to 2.15..... Nursing: The operating room and surgical nursing.
- 2.30 to 3.30..... Materia medica and therapeutics: Dosage.

Monday, Nov. 26:

- 10.30 to 11.30 .. Pharmacy: Weights and measures.
- 1.15 to 2.15..... Nursing: Infectious disease, nursing of.
- 2.30 to 3.30..... Materia medica and therapeutics: Dosage.

Tuesday, Nov. 27:

- 10.30 to 11.30... Pharmacy: Prescription filling.
- 1.15 to 2.15..... Nursing: Infectious diseases, nursing of.
- 2.30 to 3.30..... Materia medica and therapeutics: Review.

Wednesday, Nov. 28:

- 10.30 to 11.30... Pharmacy: Incompatibilities.
- 1.15 to 2.15..... Nursing: Infectious diseases, how spread.
- 2.30 to 3.30 .. Hygiene: Disposal of wastes.

Friday, Nov. 30:

10.30 to 11.30--- Hygiene: Disease prevention.

1.15 to 4.15----- Written examination in nursing, first aid, materia medica and therapeutics, pharmacy, minor surgery, and hygiene.

Those passing a satisfactory examination in the above subjects were reported eligible for special ratings.²⁵

The plan adopted by the Red Cross for the organization of its first 50 base hospitals for the Army for overseas duty and of developing these institutions in and around large civilian hospitals and medical schools had for its training object the suitable grouping of qualified physicians and specialists. A less obvious but important result was the selection for these units of a relatively high percentage of enlisted men with college and other special training. Instead of simplifying the process of training, which at first would appear to be the result of the plan, the problem was really made quite complicated, for while the courses in nursing, first aid, etc., ordinarily prescribed for sanitary troops were quickly covered by men with these qualifications, such training was inadequate for the preparation of these men for the special work of a base hospital. Therefore, methods were adopted for meeting these conditions.

The first step taken before the mobilization of the unit was, by means of a questionnaire and a personal interview with each man, the making of a survey of the personnel. The result of this was expressed on a large chart, exhibiting, in parallel columns, the names of the men; their education; their previous employment; their past experience in the Army, in hospitals, in commercial and professional pursuits, etc., and the personal impression of the examiner. This survey was used as a basis for the assigning of men for special training. It often showed in these early Red Cross units a high percentage with college training, including a number of premedical and first-year medical students, graduate students in protozoology, etc., and others with some previous military training, mostly in schools. As a rule, systematic training was not attempted until the men were mobilized and under definite military control. The men were generally divided into detachments, one to remain in camp, which included the necessary camp help, and the other attended hospital.

Each hospital detachment was placed in charge of a medical officer for general oversight and instruction. Special pains were taken in these assignments, first, to limit the number of men in any one place to those who could actually be used as part of the hospital help; and, second, to fit into specially important places men capable of qualifying for them. For the latter purpose the tabulated survey of enlisted personnel was particularly useful.²⁶

The training of the personnel of Base Hospital No. 38, at Philadelphia,²⁷ exemplifies this method, but was probably more thoroughly and completely carried out (not only because of the large number of hospitals available in Philadelphia, but because of the excellent cooperation of those in charge of and the staffs of the hospitals in the city with the medical officers connected with the base hospitals) than was possible generally. Under the direction of the commanding officer and the director of the hospital a fully organized and thoroughly systematized course of instruction was prepared and placed in active and successful operation in October, 1917.²⁷

The various hospitals of the city were approached and each agreed to take a detachment of men for training. From 7.30 a. m. to 2.30 p. m. units of 5 to 10 men were on duty in these hospitals, where they were detailed to wards, dispensaries, operating rooms, and laboratories, and given instruction in caring for the sick and wounded. Some were required to carry stretchers, others ran ambulances, served food, assisted in dressing wounds, performed the function of ward orderlies, lifted and transferred patients, assisted in giving anesthetics, etc. Two to four drivers were assigned to spend their mornings in manufacturing and repair shops learning every detail of motor construction, tire and engine trouble, etc. Four men were sent to hotels and hospitals for kitchen work and to familiarize themselves with practical cooking. While details were sent out as indicated, other squads remained at the armory (the use of which was obtained for the hospital) as guards, performed police duty, cooking, etc., and received their military training.

The following is the schedule of instruction followed:²⁷

SCHEDULE OF INSTRUCTION, OCTOBER 29 TO DECEMBER 17, 1917, BASE HOSPITAL NO. 38

- 7:30 a. m. ----- Small sections (5 to 10 men) sent for practical instruction in hospital work to the following hospitals: Jefferson, Pennsylvania, Polyclinic, St. Agnes, St. Joseph's, Jewish, Samaritan, Frankford, Lankenau. Section of 6 men to Adelphia Hotel for instruction in cooking and kitchen. Above sections reassembled at armory, 2.30 p. m.
- 7:30 a. m. ----- Section sent to motor-repair shops for instruction in operating motors, in tire and engine troubles, and in motor-repair work. Reassembled in armory, 12 noon.
- 10 a. m. ----- Section; guard mount.
- 10.15 to 11.15 a. m. Mason's Handbook for Hospital Corps, Monday, Tuesday, Wednesday. Army Regulations, Thursday, Friday, Saturday.
- 12 noon ----- Lunch.
- 1 to 2 p. m. ----- School of the soldier.

	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
3.30 to 4.15 p. m. --	Duties of a soldier and special lectures	Section in bandaging and surgical dressing	Medical nursing	Physiology	Section in bandaging and surgical dressing	Inspection
4.30 to 5.15 p. m. --	Bacteriology disinfection; parasitology; hygiene	Drill	Anatomy	Surgical nursing; minor surgery; first aid	Drill	

- 5.30 p. m. ----- Dinner.
- 6.15 to 7.15 p. m. -- French lessons on Tuesday and Thursday.
- 9 p. m. ----- Lights out in squad room (tattoo).
- 10 p. m. ----- Taps.

An important factor in the success of the training as a whole was the competition for promotion. The enlistments were made in the grade of private and it was early announced that promotions would be made on the basis of demonstrated fitness. Evening classes were held in Army Regulations, clerical work, etc., for those who desired to attend, to prepare candidates for the examinations for noncommissioned officers.²⁶

The same plan as that carried out by the base hospital units organized in connection with the medical schools and civil hospitals in the medical centers in the United States was followed by the base and evacuation hospital units organized in the medical officers' training camps and cantonments, in so far as it was possible in the early months of the war, and in May, 1918, this policy was adopted by the Surgeon General, and the personnel of all these units was sent to the various cantonments for training in the cantonment base hospitals.⁸

The evacuation hospitals were organized principally at the medical officers' training camps and at the training camp for medical enlisted reserve units at Camp Crane, Pa.²⁸

The great problem to be solved by these units while undergoing training in the camps involved the development of an organization which would be able to function and carry out the work of an evacuation hospital in active service. This problem was particularly difficult in the early months of the war because neither the administration of an evacuation hospital at the front, its function, nor the scope of its activities was clearly understood in the United States until the summer of 1918. Therefore, data concerning the scope of the work and the requirements which they would be expected to meet were not available.²⁹ It was necessary for those in charge of the training of evacuation hospital personnel to utilize as far as possible such opportunities as were available at near-by cantonment base hospitals for the training of personnel in their professional and administrative duties. Accordingly, arrangements were made with commanding officers of the hospitals to permit a limited number of men to assemble each day to receive instruction in the various departments of the hospitals. This included ward management, nursing, bed making, temperature taking, giving of enemas, anesthesia, sterilization of dressings and instruments, preparation of diets, management of the commissary storeroom, dispensary work, and care of the various classes of property. Instruction was also given to men who were to become clerks in the quartermaster department, medical property storeroom, the record office, the registrar's office, and the receiving department of the hospital.

The instruction of these groups covered a period of three months, and at the end of that time a considerable degree of proficiency had been attained.

To develop the men physically and to instill habits of discipline, formations outdoors were held at different hours of the day. Setting-up drill usually immediately after reveille was required of both officers and men. Foot drill and practice march occupied the forenoon, while various classes were organized for afternoon instruction in first aid, venereal prophylaxis, litter drill, and bearer drill without litter.³⁰

A policy of forming base and evacuation hospitals destined for overseas service, in the medical officers' training camps, and after the preliminary military training (first period of this training) to send the personnel to the general and cantonment hospitals for the purpose of instructing them in hospital work proper, as stated above (second period of this training), was approved May 3, 1918.⁸

No special provision was made at that time for the quartering of these troops at the various camps, and as a result they were, in most instances,

quartered in buildings pertaining to the cantonment hospitals. The increased demand for these units for overseas service in the summer of 1918 made it necessary for the Surgeon General to call to the attention of the General Staff the fact that these units should be regarded as troops for overseas service, temporarily receiving instruction in the various hospitals, and that for the purpose of quarters, etc., came under the category of other mobile sanitary organizations being utilized for overseas service and should not be considered as organizations for the care of sick in hospitals in this country.³¹ It was recommended and approved that 18 evacuation hospitals and 36 base hospitals be kept constantly under training in the general and cantonment hospitals in this country at all times, and that as soon as an organization was ordered abroad another was to be sent to take its place in training. On August 10, 1918, 44 base hospitals and 12 evacuation hospitals were ordered from Medical Officers' Training Camp, Fort Oglethorpe, Ga., to various camps for instruction of the personnel in base hospitals.³¹

The following description and schedule of the training of the personnel of an evacuation hospital was abstracted from the report of the training of one of these units from the time of its organization in the medical officers' training camp until its departure for overseas.³²

The commanding officer, adjutant, quartermaster, and one other medical officer were assigned to the hospital in February, 1918, but no enlisted men were assigned until the March draft. The hospital was organized on March 21, 1918, with a personnel of 4 officers and 170 recruits.

Training began at once. A classification of the men was made in order to try and select those qualified or partially qualified for certain kinds of work, and in this way a certain number of men were found more or less fitted for the duty to which they were assigned.

Seven were selected on account of some previous experience, or on account of an expressed preference for that service, and sent for instruction to the X-ray department of the base hospital at the training camp. This instruction consisted of lectures, quizzes, and practical demonstration, and included instruction in anatomy, physics, reading X-ray plates, dark-room technique, K. W. Waite and Bartlett transformer, and a United States portable unit, which included special practical training in the setting up and taking down of this portable outfit and the workings of the gasoline engine, the taking of Roentgenograms and their development in a portable dark room that was made by the students themselves.

Several enlisted men who had some knowledge of cooking were selected and sent to school for cooks and bakers for instruction. After completing their course of instruction they were appointed cooks in their own organizations and the organization opened its own mess.

As to the adequacy of the training which the personnel of these units received before departing for overseas, where they often were required to immediately proceed to the front and begin active operations, it was certainly, in the great majority of cases (although necessary on account of the existing state of war), entirely too short in time and limited in scope.²⁹ Yet the majority of these units, as well as those of the base hospitals, rapidly became oriented and acquired sufficient additional training upon arrival overseas to creditably perform the

work required of them, as shown by the war histories of these units. In this connection, one commanding officer stated that the 18 enlisted men assigned to a camp base hospital in the United States, in groups of 6 for practical and theoretical instruction in anesthesia, consisting of didactic lectures and quizzes, and watching and commenting on the administration of the anesthetic in operating room, gave the anesthetic to over 5,000 patients without a fatality due to the anesthetic. None of these men had ever been on any duty in a medical school or hospital.³³

CHAPTER VI

SPECIAL SCHOOLS

ARMY MEDICAL SCHOOL

The Army Medical School was established in Washington, D. C., in 1893.¹ It was housed in the Army Medical Museum, Seventh and B Streets SW.,² until 1910, when it was moved to a building at 721 Thirteenth Street NW.³ Following our entry into the World War, the increase in the Army and the resultant increase in the number of medical officers applying for commissions in the Regular Corps, together with the necessity for the special training of large and increasing numbers of enlisted men as laboratory technicians, and of medical reserve officers in orthopedic surgery and as X-ray operators, which was now attempted, plus the enormous increase in all other activities of the school, rendered this building inadequate. It was found necessary, therefore, to seek more space and, to accomplish this end, the premises at 458 Louisiana Avenue (fig. 26) were rented and fitted up as office rooms, metal and wood working shops, plaster bandage shop, miscellaneous laboratories, drafting and class rooms.⁴ This building, of three stories, a basement, and an attic, contained 16 rooms (not including the attic) and a stable, the total floor space, exclusive of the basement, being 4,800 square feet.⁴ Later, it became necessary to further expand the school by leasing and remodeling the premises at 472 Louisiana Avenue. (Fig. 27.) This building was lighted by windows practically on four sides, and contained approximately 22,000 square feet of floor space.⁴

The primary object of the school, at the time of its organization, was the training, in their multifarious medicomilitary duties, of young medical officers recently commissioned in the Regular corps.² Shortly after its establishment, however, officers of the National Guard and Organized Militia in limited numbers were given instruction at the school.⁵ It was soon found that the plan of commissioning young officers and then assigning them to the school was unsatisfactory, as the students did not show the proper zeal for class standing.⁶ Therefore, beginning in 1905, applicants for commission were sent to the school and given the course of instruction and a final examination at the completion thereof before they were commissioned in the Regular corps.⁷ With the creation of the Medical Reserve Corps, in 1908, it was provided that officers of this corps who applied for appointment in the Medical Corps of the Army might be placed on active duty by the Secretary of War, upon the recommendation of the Surgeon General, and ordered to the Army Medical School for instruction and further examination to determine their fitness for commission in the Medical Corps.⁸

This plan has been followed since, but with the expansion of the Army which immediately preceded and followed the entry of the United States into the World War, the automatic increase in the size of the Medical Corps, and the large increase in the Medical Officers' Reserve Corps, it became necessary to

elaborate the schedule of training. Arrangements were then made for post-graduate instruction for selected medical officers, and for courses of instruction in special subjects for Medical Reserve Corps officers detailed to the school for this purpose.⁹

At first, the course of instruction covered a period of four months;² it was increased from time to time until it extended over a period of about eight months.¹¹ The scope of instruction was likewise increased.¹¹ Beginning with the twenty-first session, on October 1, 1916, owing to the increase in the number of vacancies in the Medical Corps caused by the increase in the Army as noted, it became necessary to change the period of the course of instruction from one eight months' course per year to three courses of about 12 weeks each.¹²

FIG. 26.—Army Medical School, Washington, D. C. Main building

At the time the United States entered the World War, the main purpose and function of the Army Medical School had become: (1) The instruction of medical officers and enlisted men in the special duties connected with their professional activities in the military service, in as large numbers as possible and in the shortest possible space of time. (2) The manufacture of prophylactic antitoxins and other biological products for use in the Army, Navy, and other Government bureaus. (3) Special research investigations relating to the medical service of the Army. (4) Miscellaneous activities, such as physical examinations of officers and enlisted men, and the examination of laboratory supplies and apparatus, with a view to their adoption or rejection for the military service.⁹

FIG. 27.—Army Medical School annex. X-ray, physical chemistry, and supply building

ORGANIZATION AND ADMINISTRATION

The organization of the school now embraced the following: Administration and supply, departments of instruction, vaccine manufacture, research, and other activities.¹³ The personnel at the beginning of the war consisted of the commandant, adjutant, personnel adjutant, supply officer, 20 enlisted men, and 4 civilian employees, who were engaged in the administration of the school, and the faculty, made up of the commandant, who was president, professors, assistant professors, and instructors.

The commandant, professors, and assistant professors were detailed by the War Department from among the officers of the Medical Corps. Special professors were nominated by the faculty with the approval of the Surgeon General from among the distinguished members of the Medical Reserve Corps, and the instructors were officers of other branches of the Army detailed by the War Department to give special courses of instruction.¹¹

The faculty arranged the program of instruction, prescribed the textbooks appropriate thereto, allotted the time devoted to each subject, prescribed, the character and scope of examination, and determined the proficiency of students, subject to the express provisions of law, orders, and regulations.¹¹

The general administration of the school was intrusted to the commandant.¹¹ The adjutant was chosen by the commandant from among the professors and assistant professors; he was the custodian of the records of the faculty, he conducted the correspondence of the school and promulgated the orders of the commandant. The property officer was likewise selected by the commandant from among the professors and assistant professors. He was accountable for all property of the school, made authorized purchases, and certified accounts.

Due to the large increase in the number of students, both of officers and enlisted men, and to the large increase in the size of the detachment of enlisted men on duty at the school, it became necessary to appoint a personnel adjutant soon after war was declared in order to relieve the adjutant of some of his responsibilities.¹⁴

The strength of the Medical Department detachment of enlisted men on June 30, 1916, was 20, all grades. On June 30, 1917, the strength had increased to 39 in the following grades:¹⁴

Master hospital sergeants.....	7
Sergeants, first class.....	4
Sergeants.....	4
Corporal.....	1
Privates, first class.....	6
Privates.....	17
Total.....	39

By June 30, 1918, the strength of the detachment had increased as follows:¹⁴

Joined by transfer.....	427
Enlisted.....	367
Inducted.....	243
Total gain.....	1, 037

The losses during the year were 427, leaving a strength present on June 30, 1918, of 649. This included students as well as men permanently assigned to the school. During the next year there was a gain of 547 and a loss of 1,039, leaving a strength of 157 on June 30, 1919.¹⁵ At the beginning of the twenty-first session the civilian personnel consisted of 4 civilian clerks, including the chief clerk. By June 30, 1917, 2 additional clerks had been added to the force, and in addition a telephone operator, an X-ray technician, a mechanic, a carpenter, and 2 watchmen had been added to the force. The expansion of the activities of the school made it necessary later to increase the number of clerks to 10. Five women laboratory technicians were also employed and rendered excellent service in the laboratories. The increase in the number of branch telephone stations throughout the school, the operation of 4 trunk lines with the main telephone exchange and 4 tie lines with the War Department switchboard, necessitated the employment of 2 telephone operators.

DEPARTMENT OF INSTRUCTION

OFFICERS' BASIC COURSE

The period of the war embraced part of the twenty-first session and the entire twenty-second and twenty-third sessions of the school. Each session, consisting of 12 months, was divided into three sections of approximately 4 months each, during which a complete course of instruction was given. The twenty-first session extended from October 16, 1916, to October 4, 1917, and was divided into three sections as follows: The first section ending February 28, 1917; the second beginning March 14, 1917, and ending June 5, 1917; the third beginning August 1, 1917, and ending October 4, 1917.⁴ The twenty-second session began November 12, 1917, and was divided into three sections, the first beginning November 12, 1917, and ending February 5, 1918; the second beginning March 11, 1918, and ending June 15, 1918; and the third beginning July 10, 1918, and ending October 7, 1918.⁴ The twenty-third session of the school began November 12, 1918, and ended February 1, 1919.¹⁶

MILITARY SURGERY

The course in military surgery consisted of didactic lectures on gunshot, sword, saber, and bayonet wounds, illustrated by lantern slides, skiographs, and pathological specimens.⁴ It embraced the mechanics of projectiles, the different kinds of projectiles used in modern warfare, their effect upon the various tissues and organs of the body at different ranges; complications; the action of explosives on the tissues; the treatment of gunshot wounds and their complications on the battle field and at field and base hospitals; etiology, signs, symptoms, and treatment of traumatic aneurisms; varieties of wounds produced by cutting and penetrating weapons and their treatment, wound infections and their treatment, and statistics of battles and campaigns. To this course was added, in the later sessions, the bacteriology of war wounds, and methods of combating primary and secondary infection; in fact, all the methods which had been devised since the outbreak of the war for treating war wounds, including the preparation of patients for transportation and the statistics of the traumatisms of war, were taught. During the twenty-second session call was

made upon officers who were well known for their special professional qualifications in surgery of civil life and upon officers who had participated in war surgery in France for special lectures on this subject.⁴

ORTHOPEDIC SURGERY

A course in orthopedic surgery was established at the school November 12, 1917, primarily for the training of students sent to the school to receive special training in this subject.⁴ Later, however, it was made an integral part of the curriculum, and the classes taking the basic course at the school were given instruction in this subject. The course included the study of anatomy and surgery of muscles and joints of the upper and lower extremities, back strain, foot strain and deformities, shoe fitting, amputation, splint, brace and plaster technique, and artificial limbs. This instruction was given by lectures and clinics at the Army Medical School and at the Walter Reed General Hospital, Takoma Park, D. C.

MEDICAL DEPARTMENT ADMINISTRATION

The course in Medical Department administration included Army Regulations; the Manual for the Medical Department; customs of the service; current War Department general orders, circulars, and bulletins; and methods of administration, with all blank forms in use.¹⁴ It comprehended in detail:¹⁴ (1) Organization of the Army; territorial departments and tactical divisions; organization and duties of each corps and staff department; military rank, command, and precedence; military discipline, honors, ceremonies, official and semiofficial and personal courtesies and customs. (2) Laws and regulations in regard to the appointment of cadets and officers; promotion, retirement, and resignation; death and burial of officers; personal and efficiency reports; method of obtaining pay, quarters, and all allowances of every kind under each staff department, with all blank forms used. (3) General recruiting service and methods of enlisting at stations, with all circulars, reports, and forms. (4) Descriptive lists: Methods of muster and pay, drawing and issuing clothing and keeping accounts, discharges, and final statements, all allowances of every kind under all departments and blank forms used. (5) All laws, regulations, orders, and methods concerning the Hospital Corps, and the Army Nurse Corps. (6) Regulations: Visual and other physical standards for admission to the United States Military Academy; commissions in line or staff of the Army, promotion from the ranks; reenlistments and promotion. (7) Annual physical examination of officers and tests of field officers; duties of medical officers on all boards of examination, promotion, and retirement, and examination forms used. (8) Laws, regulations, and methods governing vaccination, typhoid prophylaxis, and venereal prophylaxis, with blank forms used. (9) Military correspondence: Forms of letter writing and methods of recording and filing in use in the service. (10) Methods of drawing rations or commutation therefor, and use of the ration under all conditions; purchase; hospital fund, its use, care, and returns; mess management. (11) Post administration: Duties of medical officers; sanitary inspections and reports; sick calls; morning reports; post hospital and general hospital administration. (12) Methods of keeping

register of sick and wounded: Reports, papers, and methods connected therewith, and all forms. (13) Morbidity and mortality rates. (14) Property: Allowances, methods of obtaining, caring for, using, accounting for, and disposing of property of all departments and all forms connected therewith. (15) Methods of purchasing necessary supplies and of having laundry work done.

This course was somewhat condensed during the twenty-second session in order to allow more time for instruction in other subjects.

MILITARY HYGIENE

The course in military hygiene was unavoidably modified in many respects from the pre-war course, owing to the fact that now there were three short sessions instead of one long one.¹⁴ Formerly, the instruction had been mainly by lectures, supplemented by a quiz, but on account of the necessity of crowding so much material into a short time, it was found expedient to resort to the quiz method. Textbook descriptions were subjected to comment and criticism based on the personal experience of the teacher in Panama and in various Army camps. The students were encouraged to relate their own experiences. The course was based on Havard's Military Hygiene. The graduates were well grounded in the essentials of the subject and were able to intelligently take up practical work in the field.

The following subjects were covered, in more or less detail: ¹⁴ (1) Camp hygiene; morbidity and mortality in the military service in peace and war; death rates; admission rates; noneffective rates; rates of discharges for disability; influence of climate, race, age, and length of service; the examination of recruits. (2) Air, its composition and relative humidity; effects of altitude, atmospheric dust, ventilation, air contamination; modern theory of bad effects of ill ventilation, tests for air; amount of space required; air purification; food, including the soldiers' ration; clothing, qualities of textile fabrics, footwear. (3) Posts, barracks, and quarters; construction and care of same; kitchens and mess rooms; the guardhouse; insects and vermin; screening; hygiene of the march; personal hygiene of the soldier; camp sites; their selection and care; improvised and portable barracks. (4) Water supplies; quantity required; methods of examination of potable waters; purification of water (*a*) by heater, (*b*) by chemical means, (*c*) by filtration; the Forbes-Waterhouse apparatus; the Darnall filter; the Lyster water bag; domestic filters; sand filtration; mechanical filtration; improvised filtration. (5) Methods for the disposal of camp excreta; the straddle trench; the pit latrine; the Havard box; postholes; the sanitary trough latrine; disposal of excreta by incineration; disposal of wastes, garbage, and refuse; the company crematory; the rock-pile crematory; lavatories; the disposal of manure. (6) Typhoid fever in the military service; history and importance of the subject; paratyphoid fever; the dysenteries; cholera; diarrhea and other intestinal diseases; methods of spread; methods of control; antityphoid vaccination in the Army. (7) Smallpox; vaccination; the other acute exanthemata; measles; mumps; meningitis; diseases of the respiratory tract; tonsillitis, bronchitis, and pneumonia; chronic diseases in the Army; tuberculosis; heart disease; the hookworm;

skin diseases. (8) Malaria in the Army; the prophylaxis of malaria; mosquito prophylaxis; screening; drainage; brush cutting; prophylactic administration of quinine; dengue; yellow fever; the *Stegomyia* mosquito; insecticides; typhus fever and its prevention; the effects of cold and hot climates.

The textbooks used for the course were:¹⁴ Vedder's Notes on Sanitation; Lelean's Sanitation in War (containing concise and up-to-date descriptions of methods then in use by the British); and Havard's Hygiene, for reference and collateral reading.

MILITARY AND TROPICAL MEDICINE

The course in military and tropical medicine consisted of assigned reading in textbooks, and recitations, supplemented by talks when considered advisable.¹⁴ The course was given at the time and parallel with the course in bacteriology, pathology, and laboratory diagnosis, so that when a disease-producing organism was being studied in one course, that disease was studied in the other course. Special attention was paid to the gross and microscopic study of the tissues in each disease; and many of the recitations were held at the Army Medical Museum where the material in the museum was utilized. The course included: (1) The military aspects of general medicine. (2) The military aspects of tropical medicine. (3) Climate and race; effects of diet, temperature, humidity, and light, acclimatization; prophylaxis. (4) Traumatism; poisons. (5) Enteric fevers, with special reference to the method of handling those diseases in the military service; yellow fever; dengue and allied fevers; bacillary dysentery; Asiatic cholera; leprosy, plague, Malta fever, infectious jaundice; yaws; relapsing fever; syphilis as handled in the Army; typhus fever; sprue; the mycoses, with special stress on sporotrichosis; pellagra; beri beri; amebic dysentery and amebic liver abscess; trypanosomiasis; the leishmaniasis; verruga peruviana and Oroya fever; malaria and black water fever; ankylostomiasis; schistosomiasis; and filariasis.

By a method of exchange of lectures, two or more lectures were given to the class by members of the staff of the Hygienic Laboratory of the Public Health Service.¹⁴ The subjects of the lectures were typhus fever, plague, leprosy, and rabies. The chief of the division of zoology, Bureau of Animal Industry, Department of Agriculture, gave one lecture on what was being done in the way of preserving meat, with special reference to trichiniasis.¹⁴

BACTERIOLOGY, PATHOLOGY, AND LABORATORY DIAGNOSIS

This course consisted of practical laboratory work, the outlines of which were laid down in the instruction sheets issued each day to the students. Reading lessons were also assigned in textbooks, with short talks supplementing the texts when it was considered desirable.⁴

Bacteriology.—Preliminary work on the preparation of culture media; and bacteriological technique, using the proteus group for the purpose.

The colon group; and bacteriological examination of water, based on standard methods of water analysis of the American Association of Public Health, 1912.

Bacteriological examination of milk, based on the standard method of the American Association of Public Health, 1915.

Bacillus typhosus, *B. paratyphosus* A. and *B. paratyphosus* B: The practical isolation from blood, stools, and urine, and their identification, including the preparation of Endo media.

Bacillus dysenteriae: Practical isolation from stools and identification.

The diphtheria group: Practical isolation and identification; Schick test.

Diplococcus pneumoniae: Isolation and identification of the type.

Meningococcus: Isolation and identification.

Streptococcus: Isolation and identification.

Anaerobes: *Bacillus tetani* and *B. welchii*.

Spirochetæ.—The parasitic spirochetes of the mouth; the blood spirochetes; *Treponema pertenue* and *T. pallidum*; study with dark field and in stained smears and sections. Examination of spinal fluid; cell count globulin; Lange's colloidal gold test.

Serology.—Complement fixation, with practical work on the application of this test in the diagnosis of syphilis. Agglutination test for transfusion of blood.

FIG. 28.—Army Medical School. Bacteriology classroom

Hematology.—The principles and preparation of Romanowsky stains. Preparation and examination of fresh and stained smears of normal blood; staining and studying smears of blood in the ordinary blood conditions as leukemias and anemias.

Protozoology.—Study of fresh material of the culture and parasitic amœbas; preparation and study of stained smears of culture amœbæ; preparation and examination of stained smears and tissue sections of the parasitic amœbæ.

Trichomonæ, *Lamblia*, *Trypanosomes*, with a description of their line of descent. Preparation and examination of fresh and stained smears of *Trypanosoma lewisi*, *T. evansi*, *T. brucei*, and *T. gambiense*. Study of stained smears of *Trypanosomes*, including *Trypanosoma cruzi*; staining and studying sections of brain in sleeping sickness; and of brain and muscle from animals infected with *Trypanosoma cruzi*.

Preparation and study of fresh and stained smears from cultures of *Leishmania infantum*; preparation and study of sections of liver and spleen of *Kala azar*; *Babesia bigemina*, and *Theileria*.

The coccidia in feces and in sections of tissue. The blood sporozoa, including preparation and study of fresh and stained smears of *Proteozoa*, stained smears of *Hæmoproteus*;

staining and study of smears of *Plasmodium vivax*, *P. malariae*, and *P. falciparum* staining and study of tissues in malaria; study of urine and tissues in black water fever; Gregarines; Sarcocystis.

The ciliates, with study of fresh specimens of *Paramoecium* and *Myctotherus*; examination of human feces containing *Balantidium coli*, and staining and studying sections of intestine of pig, with ulcers containing *Balantidium coli*.

Immunity in protozoal infections.

Chlamydozoa.—Rabies. Staining and studying sections of brain containing Negri bodies.

While most of the time is devoted to the protozoa parasitic in man, the work is taken up systematically; and there is constant comparison with the protozoa parasitic in lower animals and the free living protozoa.

Helminthology.—Cestodes: *Tænia*; *Hymenolepis*; *Dipylidium*; *Dibothriocephalus*. Study of adult worms and larvæ. *Echinococcus*.

Trematodes: *Clonorchis*; *Opisthorchis*; *Paragonimus*; *Schistosomes*.

Nematodes: *Ascaris*; *Oxyuris*; *Ancylostomum*; *Necator*; *Trichocephalus*; *Trichinella*; *Strongyloides*; *Filaria*.

Annelides: *Nirudinea*.

The course is given systematically, and the work consists in the study of human stools containing ova; study of preserved material and museum specimens; obtaining and studying living material from human beings and lower animals, and the preparation and preservation of material. Constant reference is made to the common occurrence of parasitic worms in lower animals. Special stress is placed on micrometry in this work. The entire life history of *trichinella* (living) is shown in rats; *Hymenolepis nana* (living) is shown in rats; the embryos of *Filaria bancrofti* (living) are shown in human blood; and, wherever possible, living material is used in the work.

Medical entomology.—Crustacea: *Cyclops*.

Arachnidia: *Pentastomida*; *Acarina*, including *Demodicidae*, *Sarcoptidae*, *Trombididae*, *Ixodidae*, *Scorpionidae*; *Aranea*.

Myriapoda: *Chilopoda*.

Insecta: *Hemiptera*, including *Aptera*—*Pediculidae*, *Heteroptera*—*Cimicidae*, *Reduviidae*, and *Homoptera*; *Mallophaga*; *Hymenoptera*; *Coleoptera*—weevils, Spanish fly; *Lepidoptera*; *Orthoptera*; *Diptera*. In the important order *Diptera* are taken up the *Aphaniptera*—*Pulicidae* and *Sarcopsyllidae*; *Pupipara*, *Brachycera*—*Tabanidae*, *Muscidae* (*Stomoxys*, *Glossina*, *Musca*, *Auchmeromyia*, *Cordylobia*, *Galliphora*, *Lucilia*, *Compacomyia*), *Oestridae*; *Nematocera*—*Blepharoceridae*, *Simuliidae*, *Chironimidae*, *Psychodidae*, *Culicidae*. In the important family of the *Culicidae* are studied the *Anophelines*, *Culicines*—*Culex*, *Aedes*, *Mansonia*, and *Taeniorhynchus*. A short time is spent on the *Corethrinæ*, on account of their frequent confusion with mosquitoes.

The work is taken up systematically, and special attention is given to life history, habits, and structure as related to parasitism and transmission of disease-producing organisms. Thus, special study is given to the life history of *Musca domestica*, the part it plays in the transmission of typhoid fever and other diseases, and the methods of fighting it. The work consists of the study of fresh material; obtaining, preparing, and preserving material; and the study of preserved material, models, and museum specimens.

Venomous animals, venoms and antivenoms.—Special study is given to venomous snakes, and museum specimens of the common venomous snakes and the venomous lizard of the United States. Venoms are discussed and the various antivenoms are shown and their use discussed.

The shortening of the time devoted to the course made it necessary to leave out considerable work, including that in general pathology, to which considerable time was devoted in the longer pre-war course.

There are frequent practical exercises, in which the students are required to work out "unknowns" arranged as nearly as possible like the work they may expect to meet in the service.

ROENTGENOLOGY

In April, 1917, when war was declared, the X-ray laboratories occupied the first floor rear of the building at 462 Louisiana Avenue NW., Washington, D. C., and the photographic work of the school was done there. The laboratories consisted of the following sections:¹⁷ (1) Laboratories for patients, where cases referred from the physical examination room, Surgeon General's Office and the attending surgeon's office, were examined. (2) Laboratory for instruction, which adjoined the patients' laboratory. (3) Photographic laboratory. Just before the outbreak of the war these three laboratories were all together, but when the course of instruction

FIG. 29.—Army Medical School. Classroom, X-ray physics

was changed from one class to three classes per annual session, and when in August, 1917, a class of enlisted men was started, it became necessary to rearrange the quarters so that daily classes could be held without interfering with the routine work of the department. This was accomplished by moving the photographic laboratory to the sixth floor, where three well-lighted rooms were available. The space allowed by this change was fitted up with a Waite & Bartlett transformer and other apparatus that was on hand, and a dark room and labyrinth installed, the work being done by the officers and enlisted men of the school, and was used for elementary instruction. In September, 1918, this department was asked to turn out 48 X-ray manipulators a month. In order to do this additional space was secured on the second floor of the orthopedic building, 472 Louisiana Avenue, consisting of 2 dark rooms, in

which were installed 2 developing instruction units, where 16 persons could develop at one time.

The clinical X-ray laboratory was altered by partitioning so that it was possible to secure an office, an additional operating room for dental examination, and a control space for the large operating X-ray and fluoroscopic room. By removing a large labyrinth into the dark room, a plate-loading space was secured which could supply the operators and feed exposed plates into the dark room. A smaller and less elaborate labyrinth was built, connecting these rooms. The plate-examining room, which was quite large, was divided so that a waiting room was secured. This gave more privacy for plate study, which is really the most important part of any laboratory. Special view boxes,

FIG. 30.—Army Medical School. Classroom, X-ray technique

with shelving above and below, were designed and built around the room and were found so satisfactory that the plans were adopted by the Surgeon General's Office for use in other Army laboratories. Plans for these boxes were drawn at the school. Plates were indexed and filed for easy reference and specially arranged for purposes of instruction.

The student candidates were selected from the applicants for the Regular Army who had successfully passed the entrance examinations.¹⁷ They were given one hour a week in lecture and one hour a week in practical laboratory instruction, consisting of the mechanical construction of apparatus, the operation of machines, the localization of foreign bodies, and the practical interpretation of Roentgenograms, with particular reference to the diagnostic points in the pathology of the parts concerned. Special stress was laid on the use of the newer types of apparatus adopted recently for use in the war.

Five classes of student candidates for the Regular Medical Corps, comprising 332 medical officers, passed through the school during the war period.¹⁷

The officers on duty in the Army Medical School, orthopedic section, were given the same general course as the student candidates for the Army and, in addition, special plate interpretation of bone pathology. The officers who reported for duty on tuberculosis boards were given instruction in interpretation of Roentgenograms of tuberculosis. This instruction covered two classes, two hours twice a week for a period of about three months. Eighty-eight officers secured this instruction. Patients referred for examination from the training camp at Fort Myer and other camps near Washington were used for instruction, and the clinical and X-ray evidence compared in the presence of the classes. An outline of the instruction is included:¹⁷

OUTLINE OF INSTRUCTION FOR OFFICERS

LECTURES

1. Electricity, low and high tension current.
2. X-ray properties; X-ray tubes.
3. Apparatus for use in general hospital, base hospital, and evacuation hospital. Portable outfits.
4. Fluoroscopy; Roentgenography.
5. Dangers and precautions.
6. Lantern slide demonstration of positions and technique.
7. Bone pathology.
8. Head and teeth.
9. Urinary tract.
10. Chest.
11. Gastrointestinal tract.
12. Localization of foreign bodies.
13. Review.
14. Examination, written.

LABORATORY

1. X-ray apparatus, Army types.
2. Description and operation of gas tubes.
3. Description and operation of Coolidge tubes.
4. Roentgenography; making Roentgenograms.
5. Protection of patient and operator; testing protective measures.
6. Interpretation of normal bone plates.
7. Plate interpretation; bone pathology.
8. Plate interpretation; head and teeth.
9. Plate interpretation; urinary tract.
10. Plate interpretation; chest.
11. Plate interpretation; gastrointestinal tract.
12. Localization of foreign bodies.
13. Review.
14. Examination, practical.

SANITARY CHEMISTRY

The course in sanitary chemistry consisted entirely of laboratory work, with such preliminary talks by the professor as were necessary to explain the technical procedures. The work of the first section consisted of a review of qualitative and quantitative chemical examination of stomach contents, urine, water, and milk; examination of bleaching-powder samples for available chlorine, and the preparation of Dakin's solution. Courses given in the later sessions were considerably shortened and condensed, but, with the exception of the urine analysis, all phases of the work mentioned above were dealt with.¹⁴

OPHTHALMOLOGY

The course embraced the optical principles included in the mechanism of the eye and optical instruments.¹⁴ This was followed by a study of refraction and more common internal pathological conditions of the eye. This theoretical work was supplemented by practical exercises by the students on the artificial

eye and on each other to learn the various methods of ophthalmoscopic examination; by pictures thrown on the screens, with explanatory talks, illustrating the common retinal diseases; and by cases brought from the Soldiers' Home showing these conditions. Additional clinical material was furnished by the personnel of the school and by the Episcopal Eye and Ear Hospital, Washington, D. C.

SANITARY TACTICS

Instruction in this subject embraced drill, the school of the soldier, the school of the squad, and the school of the company.¹⁴ As far as possible, individual students were allowed to drill platoons and companies and take their

FIG. 31.—Army Medical School. Classroom, chemistry

places as guides, platoon leaders, and company commanders; indoor exercises were also given illustrating maneuvers by the use of wooden blocks; litter drill; lectures on the organization of the Army, the duties of medical officers in the field, the sanitary units, guard duty, etc. Setting-up drill was also given daily at noon in the physical-examination room on the sixth floor. Included in this course were two lectures on military law and courts-martial procedure.

EQUITATION

This course consisted of instruction in nomenclature of the points of the horse and parts of the equipment; method of mounting and dismounting; explanation of the military seat; kinds of "hands," and proper method of

holding reins; "aids" explained and demonstrated; moving to front on straight line and halting; changes of direction to right and to left; work on road at walk; alternate walk and slow trot in hall and on road; suppling exercises; moving to front; halting, changes of direction, shouts; movements by threes in hall; increases and decreases of gaits; work at slow trot and trot; slow trot without stirrups or reins; saddling and bridling; the gallop.¹⁴

During the latter part of 1917 the course in equitation was discontinued and the time which had been devoted to that subject was given to instruction in sanitary tactics.

FRENCH

A course in elementary French was added to the curriculum of the school in 1917 and was discontinued in 1918.¹⁵ This instruction was given by a civilian, a native Frenchman, who was paid by individual subscriptions of members of the class. This course was not compulsory and, owing to a general feeling among the students of the first class that very little was gained by it and the time devoted to it could be used to better advantage with the other studies, the course was discontinued.

INSTRUCTION FOR TRANSPORT SURGEONS

During 1918 a special short course of instruction, in the form of lectures, was given to a group of transport surgeons ordered to the school for this purpose. The lectures covered in a brief way the following subjects:¹⁸ General and military surgery; deafness and speech defects; head surgery and surgery of the nervous system; amputations; Medical Department administration; insanity and functional neuroses; blindness; tuberculosis; paper work.

During the period from October 1, 1916, to February 1, 1919, 377 accepted candidates for the Medical Corps of the Army were ordered to the school.^{14 4} Of these, 355 completed the course and 11 elected not to take the course and did not report to the school; 9 elected to take the course in orthopedic surgery, 1 resigned, and 1 was sent home during the course of instruction on account of inaptitude. Of the number completing the course, 332 were recommended for commission. Of the 9 who elected to take the course in orthopedic surgery, 1 was ordered home before the completion of the course on account of physical disability and 1 was discharged at the end of the course on account of inaptitude, and 7 were recommended for commission in the Medical Corps.

The following is a copy of the weekly schedule of instruction for one week in each of the three sessions:^{19 20 21}

Schedule, second section, twenty-first session, Army Medical School, March 14, 1917, to May 28, 1917

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 12 Bacteriology, pathology, and laboratory diagnosis	9 to 11 Sanitary tactics and drill	9 to 12 Bacteriology, pathology, and laboratory diagnosis	9 to 12 Bacteriology, pathology, and laboratory diagnosis	9 to 12 Bacteriology, pathology, and laboratory diagnosis	9 to 12 Sanitary chemistry
1 to 2 Medical department administration	1 to 2 Surgery	1 to 2 Medical Department administration	1.30 to 3.30 Sanitary tactics, and drill	1 to 2 Surgery	1.30 Equitation at Fort Myer
2 to 3 First section, Roentgenology	2 to 3 Hygiene	2 to 3 Military medicine and tropical medicine		2 to 3 Medical Department administration	
3 to 4 Second section, Roentgenology	3 to 5 Military medicine and tropical medicine	3 to 5 Ophthalmology		3 to 4 Military hygiene	
4 to 5 Third section, Roentgenology				4 to 5 Ophthalmology	

Schedule, first section, twenty-second session, Army Medical School, commencing November 12, 1917

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 11 Bacteriology, pathology, laboratory diagnosis	9 to 11 Drill at Soldiers' Home	9 to 11 Bacteriology, pathology, laboratory diagnosis	9 to 11 Bacteriology, pathology, laboratory diagnosis	9 to 11 Bacteriology, pathology, laboratory diagnosis	9 to 11 Sanitary chemistry
11 to 12 French, section A; French study, section B	11.30 to 12.30 French, section B; French study, section A	11 to 12 French, section A; French study, section B	11 to 12 French, section B; French study, section A	11 to 12 French, section A; French study, section B	11 to 12 French, section B; French study, section A
12 to 12.30 Physical exercises, room 606		12 to 12.30 Physical exercises, room 606	12 to 12.30 Physical exercises, room 606	12 to 12.30 Physical exercises, room 606	12 to 12.30 Physical exercises, room 606
1 to 2 Medical Department administration	1 to 2 Military surgery	1 to 2 Military medicine and tropical medicine		1 to 2 Military surgery	1.30 Equitation at Fort Myer, by platoons
2 to 5 Ophthalmology, lectures and practical work	2 to 3 Military hygiene	2 to 3 Roentgenology (lecture)	2 to 4 Drill at Soldiers' Home	2 to 3 Military hygiene	
	3 to 5 Military medicine and tropical medicine	3 to 4 Medical Department administration		3 to 4 Chemistry (lecture)	
				4 to 5 Medical Department administration and military law	

Practical work in small sections, to be announced, will be given in Roentgenology from 11 to 12 daily. Recitations in sanitary tactics will be held from time to time as announced. The division into platoons for equitation will be announced later. Officers taking the course in military orthopedies will take military drill and all the afternoon courses with the exception of ophthalmology. They will take the practical work in Roentgenology in sections Mondays from 2 to 5, according to later announcement.

Schedule, first section, twenty-third session, Army Medical School, November 11, 1918, to February 10, 1919

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
8.50 to 10.50	9 to 11	9 to 11	9 to 11	9 to 11	9 to 12
Drill	Bacteriology, pathology, and laboratory diagnosis	Bacteriology, pathology, and laboratory diagnosis	Bacteriology, pathology, and laboratory diagnosis	Bacteriology, pathology, and laboratory diagnosis	Sanitary chemistry

SECTION WORK IN ROENTGENOLOGY, TUBERCULOSIS, AND CARDIOVASCULAR DISEASES

	11.05 to 11.35		11.05 to 11.35		12 to 12.30
	Physical exercises		Physical exercises		Physical exercises
1.30 to 4.30	1 to 2	1 to 2	1 to 2	1 to 2	1 to 3
Orthopedic surgery	Military surgery	Orthopedic surgery	Orthopedic surgery	Military surgery	Drill
	2 to 3	2 to 3	2 to 3	2 to 3	
	Military hygiene	Military medicine and tropical medicine	Medical Department administration	Military hygiene	
	3 to 5	3 to 4	3 to 4	3 to 4	
	Military medicine and tropical medicine	Medical Department administration	Roentgenology (lecture)	Medical Department administration	
		4 to 5	4 to 5	4 to 5	
		Refraction ^a	Refraction ^a	Refraction ^a	

^a A course of 9 hours in refraction will be given as indicated above from December 4 to December 20.

The practical work in small sections will be posted. Recitations in sanitary tactics and in map reading will be held from time to time as announced.

SPECIAL INSTRUCTION (OFFICERS)

ORTHOPEDIC SURGERY

The section of orthopedic surgery provided a course of instruction in the theory and practice of orthopedic surgery for certain officers ordered to the school for special instruction in this work.⁴ In addition to this, the course was made an integral part of the curriculum of the school, and all officers, including those taking the basic course, and who were candidates for the Regular Medical Corps, were required to take this course of instruction.¹⁴

Officers who were ordered to the school for special training in orthopedic surgery were given, in addition to the training in this specialty during the morning hours, instruction in military drill, and in the subjects taught in the lectures of the regular course during the afternoon hours. These officers were not necessarily candidates for the Regular Medical Corps, but it was considered that the instruction they received was practically the same as that given to the regular classes, and the same standard was maintained for them. They were required to pass the same examination, in the subjects which they were taught, and those successful in these examinations and in the required work

of their specialty were given certificates of graduation. Those graduating, who fulfilled all the other requirements for commission, as to physical qualifications, age, hospital experience, adaptability, etc., were recommended for commission in the Regular Medical Corps.²²

The three-story building at 472 Louisiana Avenue having been leased and placed in condition on July 1, 1918, the orthopedic section was moved to this building.¹⁵ The principal activities were confined to the basement and first floor. Besides the offices and class rooms, the orthopedic annex was provided with shops and laboratories equipped with a motor-driven lathe, combination hand punch and shear punch drill, water-driven emery grinder, work benches, laboratory table, appliances for application of plaster bandages and dressings.

In addition to the commissioned personnel there was assigned to this section an enlisted personnel of 36 men, through whose equipment and qualifications the section was capable of serving a new and most useful function, aside from that of a teaching institution, namely, that of a mechanical unit for such experimental, developmental, and repair work as might be required, not only by the division of orthopedic surgery, Surgeon General's Office, but by the Medical Department as a whole.⁴

The following is a synopsis of the course of instruction:⁴

Anatomy and operative surgery.—

* * * * *

The course in anatomy consisted of didactic lectures on applied anatomy with special reference to operative orthopedics. Special study in muscle function, topography, and distribution of peripheral nerves; gross and special dissection on the cadaver at Georgetown University, accompanied by quizzes and demonstrations; special dissections on all principal nerves; and cross section study.

* * * * *

The course in operative surgery included didactic and practical work on the cadaver at Georgetown University, demonstrating the various new orthopedic operations on bones, joints, tendons, and nerves.

Shoes and feet.—Including the study of component parts of shoes and their functions; the method of manufacture; repair and inspection of shoes for Army use; the application of orthopedic appliances to shoes for correction of deformities; the care of the soldiers' feet in camp and on the march.

Shopwork.—In the shop the officers were taught the construction and production of all types of splints authorized by the department of orthopedics, Surgeon General's Office, beginning with drafting and reading of blue prints, then taking up the construction of the simpler types of splints and later the more complicated ones. This course also included the reconstruction and remodeling of the different types of splints to meet the varied conditions and needs that arise on the field and in camps and hospitals.

Plaster work.—This section included lectures on material; preparation and technique of applying plaster dressings; demonstration and uses of plaster in treating compound fractures and infected wounds of the joints and other uses developed during the present war. All officers under the supervision of the instructor applied casts illustrating all the principles used in the application of plaster.

Clinical work.—This work included diagnosis, treatment, and demonstration of the various military orthopedic conditions on patients at Walter Reed General Hospital and Providence Hospital, Washington, D. C. A number of these cases consisted of war wounds received on the various European battle fronts.

The approximate number of hours devoted to orthopedic surgery in each of the special courses was 419, divided as follows: ⁴

Anatomy and operative surgery-----	Hours 27
Shoes and feet-----	31
Shopwork-----	104
Plasterwork-----	79
Clinical work-----	178
Total-----	419

An example of the weekly schedule of instruction follows: ²³

Schedule for orthopedic sections A, B, C, D, E, F, beginning March 25, 1918

Monday, Mar. 25	Tuesday, Mar. 26	Wednesday, Mar. 27	Thursday, Mar. 28	Friday, Mar. 29	Saturday, Mar. 30
9 to 11.15 Walter Reed Hospital, clinical instruction	9 to 11 Washington Barracks, drill	9 to 11.15 Walter Reed Hospital, clinical instruction	9 to 11 Providence Hospital, clinical instruction	9 to 12 Annex, technique, (shop) A, B, D, E (plaster), C, F	9 to 11.15 Walter Reed Hospital, clinical instruction
11.15 to 12 En route	11 to 11.30 En route	11.15 to 12 En route	11 to 12 En route		11.15 to 12 En route
12 to 12.30 Annex, physical exercise	11.30 to 12.30 Annex, shoes and feet	12 to 12.30 Annex, physical exercise	12 to 12.30 Annex, physical exercise	12 to 12.30 Annex, physical exercise	12 to 12.30 Annex, physical exercise
12.30 to 1 Lunch period	12.30 to 1 Lunch period	12.30 to 1 Lunch period	12.30 to 1 Lunch period	12.30 to 1 Lunch period	12.30 to 1 Lunch period
1 to 2 Army Medical School, Medical Department administration	1 to 2 Army Medical School, military hygiene	1 to 2 Army Medical School, X-ray lecture		1 to 2 Army Medical School, military hygiene	1 to 2 Washington Barracks, drill
2 to 3 Annex, French	2 to 3 Army Medical School, military surgery	2 to 3 Army Medical School, military and tropical medicine	2 to 4 Washington Barracks, drill	2 to 3 Army Medical School, military surgery	
3 to 5 Army Medical School, X-ray laboratory	3 to 5 Army Medical School, military and tropical medicine	3 to 4 Army Medical School, Medical Department administration		3 to 4 Annex, French	
		4 to 5 Annex, French		4 to 5 Army Medical School, Medical Department administration	
		7.30 to 9.30 Annex, anatomy		7.30 to 9.30 Georgetown University Medical School, anatomy	

SPECIAL LABORATORY INSTRUCTION

In addition to the laboratory instruction given to officers and enlisted men who were taking the regular and special courses, groups of officers of the Medical Corps and Sanitary Corps were sent to the school from the Rockefeller Institute of Medical Research for additional laboratory instruction. The course given these officers was of one month's duration, was given each month, and embraced the following subjects:⁴ Culture media; *Bacillus typhosus*; *Bacillus paratyphosus A*; *Bacillus paratyphosus B*; the isolation and identification of these organisms from the stools; dysentery bacillus, pneumococcus, standard agglutination method, anaerobes, staining of tubercle bacilli, gonococcus, malarial parasites. Approximately 250 officers took this instruction during the period of the war.⁴

INSTRUCTION AND PREPARATION FOR FOREIGN SERVICE

In May, 1917, it became necessary to send a large number of medical officers to foreign service; these officers and many more each month thereafter were sent to the Army Medical School to be prepared for such service. Instructions were given them as to uniforms, equipment, finances, etc.¹⁴ They were vaccinated against typhoid and paratyphoid, A and B, and smallpox. Physical examinations were made and they were reported to the Surgeon General when ready for orders. They were furnished with true copies of their orders and given final instructions regarding their arrival at and departure from the port of embarkation.

The training of these officers, as well as that of enlisted men making up units or detachments destined for overseas service in gas defense, was given at Camp Meade, Md., under the direction of the division gas officer of that camp.²⁴ The handling of this work resulted in the establishment of the "foreign-service department," and involved considerable increase in the clerical work of the school. The system of handling these officers was very successful and was continued throughout the period of the war.

GRADUATION

No formal graduation exercises were held during the period of the war. After the graduation of the third section of the twenty-first session, the award of the Sternberg medal was discontinued for the period of the war. The awarding of this medal was resumed at the commencement of the twenty-fourth session, which began October 1, 1919.

INSTRUCTION FOR ENLISTED MEN

COURSE IN LABORATORY TECHNIQUE

Some of the enlisted men of the Medical Department were ordered to the school for instruction in laboratory technique, while others were enlisted at the school for that purpose. They were grouped in three classes:¹⁵ (1) Beginners' class of laboratory technicians; (2) advanced class of laboratory technicians; the beginners' class of laboratory technicians received instruction in the cleaning of glassware, sterilization, the use of the microscope, routine stains and in the bacteriological laboratory. The course was of two months' duration and

was continuous. The advanced class of laboratory technicians received instruction along the same lines as the regular officers' class in the bacteriological laboratory with the addition of instruction in the staining the gonococcus, tubercle bacillus, and the examination of urine. The course was also of two months' duration. A new class was started every two months. Half of the time of these two classes was spent in the chemical laboratory, where they received practically the same instruction as was given the Regular officers' classes, and included special topics in volumetric analysis and certain laboratory methods of the Medical War Manual No. 6, and the sanitary analysis of water and sewage. Approximately 900 men received instruction in these classes and of these, 92 were commissioned as second lieutenants in the Sanitary Corps, and 77 in addition were recommended for commission as second lieutenants in the Sanitary Corps.^{4 15}

X-RAY TECHNICIANS

The need for enlisted X-ray technicians and manipulators in the Medical Department necessitated the establishment of a school of instruction, which was accomplished August 16, 1917.¹⁷ The outline of instruction was as follows:¹⁷

LECTURES

1. X ray in general; excitation tubes in general; tubes, hydrogen, gas, Coolidge.
2. Plates, envelopes, films, screens, cassettes; exposure effects; developer; fixing; plate holder; marking plates.
3. Electricity: Terms and principles; dynamo motors; electricity magnetism; Ohm's law; Lenz's law.
4. Coils; choke coils; transformers; interrupters; rheostats.
5. Exposure factors: Voltage; amperage; time; distance; saturation curve; critical curve.
6. Relation of shadow to radiation; tube shift; shadow traverse.
7. Standard positions; stereoscopy.
8. Fluoroscopy.
9. Use of transformer chart; trouble and trouble hunting; wiring; machines.
10. Troubles and difficulties: Plates—developer; over and under exposure.
11. Lecture on osteology.

LABORATORY

1. X-ray machines; general wiring; trace wiring. Make diagram.
2. Coils and interrupter; saturation curve.
3. Transformer chart.
4. Views of Army Ex. 6: Relation of shadow and direction of radiation.
5. Relation of time of exposure to target.
6. Current and time relation.
7. Voltage law Ex. 9.
8. Making plates of normal parts.
9. Keeping records and clerical work.
10. Weekly written tests are customary. A number of the examination papers are on exhibit.

OUTLINE OF DARK-ROOM INSTRUCTION²⁵

- First period.*—(1) General outline of dark-room procedure.
- (2) Description of a photographic emulsion and effect when subjected to various forms of energy.
- (3) Correct methods of handling plates (reason for).
- (4) Cleanliness and precautions for development.
- Second period.*—(1) Metric system: (a) Linear; (b) volume; (c) weight; (d) temperature.
- (2) Developer: (a) Purpose; (b) ingredients (purpose of each); (c) method of mixing (reasons for); (d) action of.

Third period.—(1) Review of metric measurement.

(2) Fixation: (a) Purpose of; (b) ingredients (purpose of each); (c) method of fixing (reason for); (d) action.

(3) Fog: (a) Definition of; (b) dichoric, (1) reason, (2) characteristics; (c) function; (d) causes.

(4) Stains (reasons for).

Fourth period.—Quiz (oral).

Fifth period.—(1) Developer: (a) Formula; (b) method of mixing.

(2) Dark-room practice.

Sixth period.—(1) Fixing bath: (a) Formula; (b) method of mixing.

(2) Dark-room practice.

Seventh period.—(1) Review of: (a) Developer; (b) fixing bath; (c) mixing of (a) and (b).

2. Dark-room practice.

Eighth period.—(1) Quiz.

(2) Dark-room practice.

Ninth period.—(1) Manipulation of formula.

(2) Dark-room practice.

Tenth period.—Review and oral quiz.

OUTLINE OF WORK FOR MACHINE LABORATORY²⁶

September 24 to 25. Introductory talk covering (a) Coolidge tubes: (1) construction; (2) parts; (3) filament (its significance).

(b) Rectifiers: (1) Construction; (2) principles of operation; (3) purpose.

(c) Transformers: (1) Construction; (2) principles of operation.

(d) Rheostats: (1) Construction, (2) principles of operation.

(e) Autotransformers: (1) Construction; (2) advantages; (3) dangers.

(f) Electrical measuring devices: (1) Ammeter; (2) milliammeter; (3) spark gap.

(g) Electrical units.

(h) Motors and generators, principles, construction, etc. (practical).

September 26 to 27. Tracing wiring and drawing wiring diagram of Waite & Bartlett.

September 28 to October 1. Bedside and base hospital units: (a) general talk of their object, usefulness, and advantages.

(b) Bedside transformer (method by which it produced both high and low tension currents).

(c) Tracing wiring of bedside unit.

(d) Study of changes necessary to operate machine on alternating and direct currents of different voltages.

October 2 to 3. Care of machines: (a) Talk on importance of proper care.

(b) Practical work: (1) Cleaning brushes, commutator, and wiring; (2) oiling motor and generator; (3) care of transformers.

October 4. Trouble hunting: (a) Apparatus will be disconnected or improperly connected and class will be required to locate the trouble.

(b) Use of test lamp.

(c) The following trouble in particular will be put into the machine: (1) Burnt out fuses; (2) dirty brushes; (3) brushes improperly attached; (4) loose connections; (5) broken wires; (6) wires so connected that current attempts to go through tube in the wrong direction.

October 5. Oral quiz.

October 7. Continuation of trouble hunting.

October 8. Transformer charts: (a) Talk on value and usefulness of transformer chart.

(b) Making of transformer chart by the class.

October 9 to 11. X-ray pictures: (a) Talk covering (1) principles involved in taking X-ray pictures, (2) reasons for using different settings, (3) methods of protection.

(b) Taking of pictures by the members of the class.

October 12. Written examination.

October 14 to 15. Anatomy: Study with skeleton of most important bones, joints, etc., in the human body.

October 16 to 17. Continuation of picture taking.

October 17 to 18. Work on alternating current machines: (a) Talk on alternating current machines covering (1) construction, (2) difference between alternating-current and direct-current machines.

(b) Tracing wiring and examining construction of an alternating-current machine.

October 19. Examination covering work of entire course.

GENERAL OUTLINE OF INSTRUCTION OF "THE PORTABLE X-RAY UNIT" ²⁷

September 24 to 27, inclusive. General outline of the portable X-ray unit: (a) Deleo engine (engine end, electrical end); (b) control unit (transformers, boosters, filament control, meters); (c) table (set up and knocked down, tube box, X-ray tube).

September 28. Examination.

September 30 to October 8, inclusive (examination October 5). Deleo plant, detail and principles of the functions and position of each part:

(a) Housing: Engine end, cylinder, cylinder head, oil container, breather tube, carburetor; electrical end (pole shows field windings).

(b) Crank shaft: Fly wheel, Hyatt roller bearing, oil-splash gear, crank where piston rod is connected (piston, piston rings), worm gear, New Departure double roller bearing (oil grooves), armature (commutator, slip rings).

(c) Cam shaft (gear that meshes in the worm gear (on crank shaft) drives this shaft): Eccentrics which operate connecting rods, they the rocker arms, they the valves; end of shaft operates timer; timer.

(d) Electrical circuits: Engine control unit, transformers, boosters, filament control, meters.

(e) Operation of plant.

October 9 to 14, inclusive (examination on October 12):

(a) Practical work (taking down and setting up of engine, taking down and setting up of table, taking pictures).

(b) Trouble hunting.

October 15. Examination or review and bedside instructions with alternating and direct current, 110-220-volt; taking pictures.

Schedule of instruction, school of manipulators ²⁸

Daily except Saturday	Laboratory of electricity	Laboratory portable apparatus	Developing laboratory
8 to 10	A { 1. 8 men 2. 8 men	B { 1. 8 men 2. 8 men	C { 1. 8 men 2. 8 men
10 to 12	B { 1. 8 men 2. 8 men	C { 1. 8 men 2. 8 men	A { 1. 8 men 2. 8 men
1 to 2	Conference of whole class; medical officer in charge		
2 to 4	C { 1. 8 men 2. 8 men	A { 1. 8 men 2. 8 men	B { 1. 8 men 2. 8 men

Forty-eight men; 3 groups of 16; 3 daily periods; 20 working days.

Saturday, written examination or quiz; general police and make-up work.

Ten-minute intervals between the two morning periods.

Groups of 16 to be divided into units of 8 men under the chief instructor and 1 assistant.

These men, upon completion of the course of instruction in X-ray work, were given practical experience by working in the Army Medical School; laboratory for patients, Soldiers' Home; Providence Hospital; George Washington University Hospital; Georgetown University Hospital; Children's Hospital; Episcopal Hospital; and the Walter Reed Hospital, Washington, D. C.¹⁵

Lists of qualified technicians and manipulators were sent to the Surgeon General's Office, X-ray division, for assignment to duty elsewhere.¹⁷ Technicians who showed special adaptability were retained at the school as assistants. Several received commissions in the Sanitary Corps. Upon receiving their commissions they were ordered away from the school and assigned to duty in various capacities, at home or overseas.

Primarily, these men were supposed to be able to care for the X-ray apparatus, to make minor repairs, and to keep the machines running satisfactorily. A number of them thoroughly understood the electrical construction and were able to do almost every kind of repair work. They were usually given assignments where their knowledge was most useful. In this capacity they were called technicians. Secondly, they were instructed in making exposures of patients, developing the plates, and general dark-room work. They were given a little osteology to enable them to intelligently make plates of the parts of the body requested by the surgeon. In this capacity they were called manipulators. They were not supposed to interpret Roentgenograms or to give opinions on plates they had taken.¹⁷ It was not expected that they should in any way usurp the duties of the Roentgenologist.

Certificates of proficiency were given to men who were found qualified to perform this special duty.¹⁷ Enlisted men found disqualified after a fair trial in the classroom were transferred to other duties. Two hundred and thirty-three enlisted men received special instruction in X-ray technique, of which 25 were not found proficient and given other duty. About 175 were given certificates of proficiency, while the remaining 33 were given duty in the X-ray laboratories as assistant and no doubt later were eligible for certificates.

These manipulators and technicians were on duty in most all of the cantonments and camps, and many were on duty in France.

INSTRUCTION IN ORTHOPEDIC WORK

In addition to the 36 enlisted men on a duty status in the orthopedic department on July 1, 1918, 226 additional men reported during 1918 for duty and instruction.¹⁵ These men received instruction in litter drill, first aid, hygiene, anatomy, physiology, Medical Department administration, metal work, shop work, brace work, leather work, plaster work, carpentry work, machine work, blacksmithing. Two hundred and forty-six hours were devoted to this instruction, and as the men became proficient they were promoted to the grade of sergeant or corporal, and were ordered as orthopedic technicians to the several general hospitals.¹⁵ One hundred and eighty-two men were transferred as technicians, 18 as clerks, 44 discharged, and 18 were on duty at the school at the end of 1918.

DEPARTMENT OF VACCINE MANUFACTURE

The manufacture of prophylactic typhoid vaccine was developed in the Army Medical School in 1908, by Russell, and since 1908 this vaccine and other biologic products have been manufactured by the school and furnished to the Army, Navy, Public Health Service, and other Government bureaus.⁴ During 1916, the mobilization of practically the entire National Guard, the increase in the Regular Army and Navy, and the requirement that paratyphoid A and B, as well as the typhoid vaccines, be administered to all those in the military

service, caused by the development of an epidemic of paratyphoid among the American expeditionary forces in Mexico, necessitated an enormous increase in the production of these vaccines.⁴ The declaration of war, with the enormous increase in the military forces by enlistments, the mustering into the military service of the National Guard, and the preparation for the mobilization of the National Army, made it necessary to speed up the manufacture of all biological products to a still greater extent. This was done without delay, and it was always possible to supply all demands adequately.

On account of the epidemic of paratyphoid A in the expeditionary force in Mexico in 1916, experimental work on paratyphoid A vaccine had already been begun in September, 1916, and work on paratyphoid B was taken up as soon as war was declared.²⁹ At first, on account of fear of severe reactions, it was planned to vaccinate separately with typhoid and paratyphoid A and B. This plan was begun in July, 1917, but it soon became evident that this doubling of the work was unnecessary, and the triple typhoid vaccine was prepared and was issued in August, 1917. In June, 1918, lipo-vaccine was issued after experimental work which seemed to show that a single dose of oil vaccine was sufficient to protect. Saline vaccine was discontinued in August, 1918, but was readopted in March, 1919, because it was found that lipo-vaccine was difficult to make in a sterile condition. Either the organisms were not killed, or contamination took place, and it was also found that the protective value was inferior to saline vaccine in animals.

Leutin tests were practically discontinued on account of the difficulty of making material and the uncertainty of the results. The laboratory acted as a supply depot of diagnostic sera, animals, stains, glassware, etc., for neighboring camps and in some instances for the whole Army.²⁹

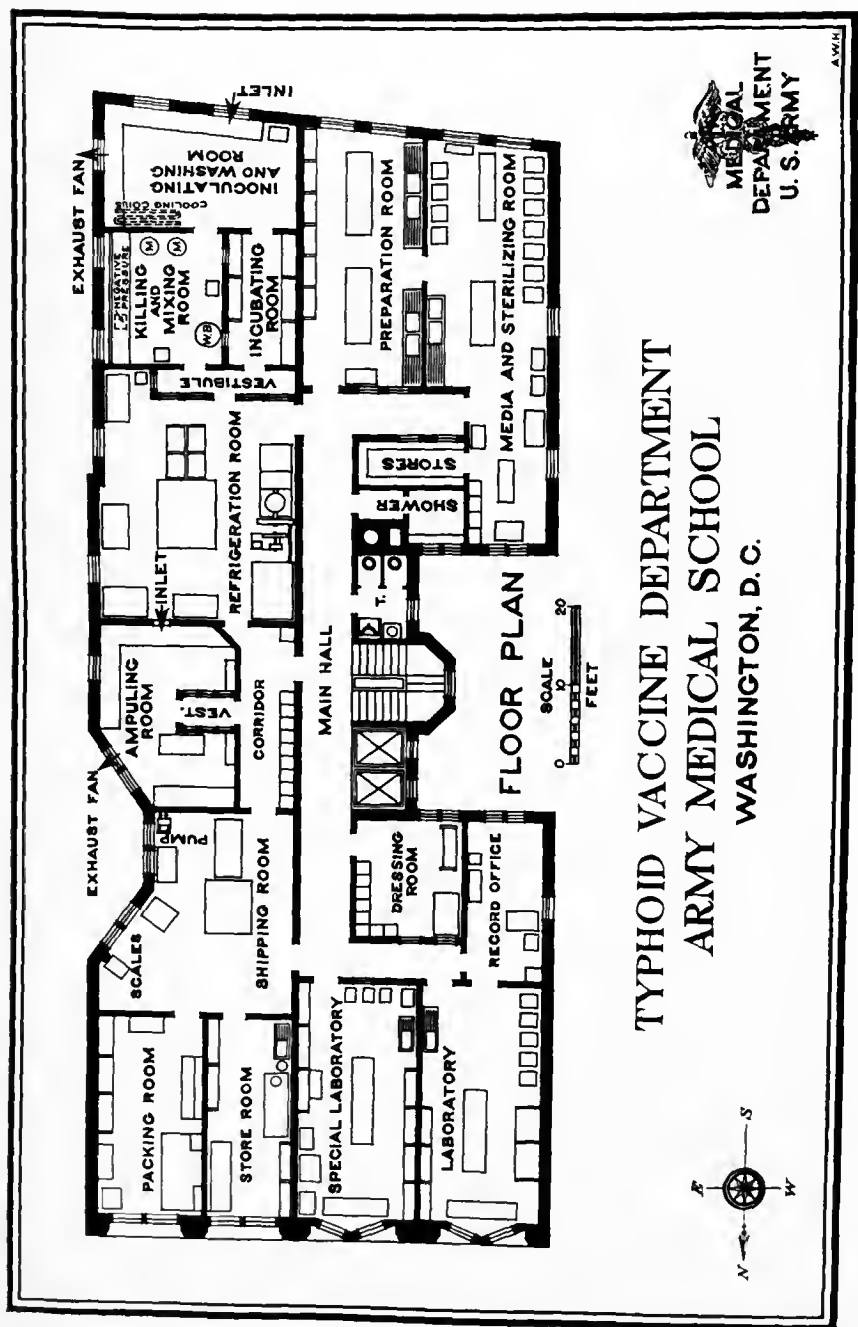

The following shows the amount of vaccine distributed to the Army, Navy, and other Government departments and civilians during the period April 1, 1917, to November 15, 1918:³⁰

	c. c.		c. c.
Plain typhoid vaccine.....	2, 772, 813	Gonococcus lipo-vaccine.....	49, 444
Triple typhoid saline vaccine...	16, 640, 247	Staphylococcus vaccine.....	3, 718
Triple typhoid lipo-vaccine....	1, 528, 385	Streptococcus vaccine.....	3, 310
Paratyphoid lipo-vaccine.....	2, 297, 995	Staphylococcus acne vaccine.....	2, 678
Pneumococcus lipo-vaccine	1, 565, 370	Staphylococcus-streptococcus vac-	
Influenza lipo-vaccine.....	74, 549	cine.....	900
Veterinary lipo-vaccine.....	1, 296, 780		

During the period October 28, 1918, to December 26, 1918, meningococcus lipo-vaccine was distributed to the Army and civilians amounting to 8,202 c. c.³⁰

DEPARTMENT OF RESEARCH

During the year 1918 several officers were engaged on research problems, relating principally to the diseases of soldiers.¹⁵ The most extensive of these was the work on experimental pneumococcus pneumonia in monkeys. Two hundred monkeys were secured for this purpose from the Philippine Islands, through the supply division of the Surgeon General's Office, and the work was considered of fundamental and of practical importance. The work on Xylose fermentation of typhoid bacilli was of scientific and practical value in the typhoid problem in the Army.

Research work was carried on in the chemical laboratories on the chemical and physical action of ultra-violet rays on certain vegetable oils, and the sterilization of oils by means of ultra-violet rays. The following is a summary of the research work done by personnel connected with the pathological laboratories during the fiscal year ending June 30, 1919.¹⁵ Studies on complement fixation, especially the production of amboceptor; studies on deficiency diseases; studies on lipo-vaccine and the production of such vaccines; triple typhoid lipo, triple pneumococcus lipo, triple dysentery lipo, cholera lipo; studies on the Group IV pneumococci; studies on the hydrogenion concentration of media; experimental production of plague vaccine; experimental production of influenza vaccine; studies on the grouping of *B. influenza*; agglutination in animals following lipo-vaccine; studies on pneumococcus saline vaccine; studies on the optimum growth of meningococcus; studies on the production of sera in goats; studies on the effects of lipo-vaccine on the leucocytes; studies in complement fixation with special reference to typhoid and pneumococcus; effect of lipo-vaccine in increasing susceptibility to other diseases; studies on the local reaction in animals against bacterial vaccines; experimental pneumococcus pneumonia in monkeys; prophylactic vaccination, specific treatment; technique of preparation of vaccines. The X-ray department aided in the designing and completing of an X-ray ambulance for the United States Army portable X-ray unit.¹⁵ The ambulance was driven to Ontario, Canada, where it was demonstrated for the benefit of the Canadian Government. The portable field outfit, the portable bedside unit, and numerous other new pieces of apparatus were tested out in conjunction with the duties of the laboratory.

MISCELLANEOUS ACTIVITIES

In addition to the regular courses of instruction, various activities of the school were concerned directly or indirectly in the teaching of officers and enlisted men.

Clinical laboratory.—During the period from January 1, 1917, to December 31, 1918, there were made, among many others, the following examinations and tests:^{4 15} Examinations for typhoid fever, 2,168; animal inoculations for immune sera, etc., 6,162; miscellaneous examinations, gonococcus, etc., 4,088; Wassermann tests, 33,951; treatments with bacterial vaccines, 35,558.

Wassermann tests.—The Wassermann reaction was performed continuously as a diagnostic test for syphilis. During the fiscal year ending June 30, 1918, the total number of Wassermann tests made in the laboratory was 19,524, of which 531 were reexaminations, 16,583 were made in accordance with existing orders calling for a Wassermann test on applicants for commission, enlisted candidates for various service schools, recruits, etc., and 2,461 examinations of new cases. Of the latter, 1,280 were for syphilis or suspected syphilis, and 1,181 were for cases suffering with diseases other than syphilis; in addition, there were 681 tests made for gonococcus fixation, 242 Wassermann's made on spinal fluids in three dilutions.

The following is a summary of analyses and examinations made during the period from June 30, 1917, to June 30, 1919:^{4, 14, 15} Urines, 34,819; water, Army posts, 175; drugs, 13; foods for poisons, 12; water, other sources, 10; stomach contents, 9; miscellaneous, 260.

X-ray clinical laboratory.—The following is a summary of the work of the clinical laboratory of the X-ray department of the school:¹⁷

	September, 1917, to June 30, 1918	July, 1918, to November 30, 1918	Total
Number of patients seen	2,660	1,301	3,961
Radiographs	3,799	3,167	6,966
Dental films	5,325	2,939	8,264 ¹⁰

X-ray photographic laboratory.—The work consisted of taking photographs for the various departments of the school of things of interest to the Medical Department, of preparing lantern slides, and of making prints.¹⁷ Facilities were available for making enlargements and reductions and for copying drawings, tracings, and photographs for the preservation of records. During the year 1917-18 the following amount of work was performed:¹⁷

	September, 1917, to June 30, 1918	July, 1918, to November 30, 1918	Total
Negatives	807	549	1,356
Prints	2,188	1,619	3,807
Lantern slides	1,225	299	1,524 ¹⁰

X-ray testing laboratory.—Anticipating an increase in the experimental and testing work for the Surgeon General's Office (X-ray division), additional space was secured on the third floor at 472 Louisiana Avenue, where electrical control boards were put up for both alternating and direct currents, with recording meters, circuit breakers, etc. The large Delco 3 kw. gas electric set was installed outside, and the small $\frac{3}{4}$ kw. Delco engine set up inside the building.¹⁷ In connection with the testing laboratory, there was erected a dark room for experimental work on plates, chemicals, and the use of new types of ventilators, plate dryers, cabinet, and labyrinths.

Special activities of the X-ray department.—The facilities of the department were at the disposal of the officers on duty in the X-ray division of the Surgeon General's Office, and most of the work was done under their guidance and supervision. Aside from the routine reports on intensifying screens, photographic plates, X-ray accessories, apparatus, and instruments, studies were made concerning the protective value of lead glass, gloves, aprons, fluoroscopic boxes, etc., supplied for use in the Army.

The manufacture of standard Army splints, plaster of Paris bandages, etc.—In addition to the training of officers and enlisted men in orthopedic surgery, splint making, etc., large numbers of the standard Army splints, plaster of Paris bandages, and various other apparatus used in the orthopedic and other services of the Army were manufactured by the orthopedic department of the school and shipped to the various hospitals throughout the service. During the period from June 30 to December 31, 1918, in addition to the other apparatus manufactured, more than 3,100 splints were produced.³¹

Illustrations for lectures by medical officers.—During the year 1917 the school was charged with the arrangements for and the handling of the details in connection with furnishing medical officers assigned as special lecturers at medical schools throughout the country with moving-picture films and lantern slides for use as illustrations for their talks.¹⁴ For this purpose five large moving-picture films illustrating the activities of the Medical Department in the field were sent to the school. Correspondence was kept up with the officers concerned and the itinerary was drawn up. The films and slides were sent by express to various points throughout the country, including New York, Philadelphia, Baltimore, St. Louis, Omaha, Columbus, Buffalo, Syracuse, and other cities.

Physical examinations.—The making of physical examinations during the period of the war was a very important function of the Army Medical School. This work from the beginning was conducted on a scale of considerable magnitude, but its scope so broadened during the progress of the war as to include physical examinations of practically every nature and for every purpose. The amount of time consumed and the labor involved by having these examinations made by one officer and the constant change in detail for the various examining boards appointed made it advisable and necessary to inaugurate a system by which examination could be made systematically and the records secured against loss. Therefore, early in 1917 the service of the Medical Reserve Corps officers awaiting orders at the school for overseas service were secured and utilized to assist in this work, and a regular system inaugurated. By this plan 50 to 100 officers could be examined a day without confusion and the physical examination forms carefully checked and forwarded to The Adjutant General. During the two and a half months from April 15 to June 30, 1917, approximately 1,000 examinations were made, with a constant increase in the number to be examined each day. This work became a function of ever-increasing magnitude, and its scope not only included the physical examinations of officers for promotion and of applicants for the various Officers' Reserve Corps, but also for the determination of the physical fitness of officers for overseas service and the examination of men inducted as privates in the Medical Department. During the year beginning July 1, 1918, and ending June 30, 1919, approximately 13,000 physical examinations were made.¹⁵ Included in this number were physical examinations made for all branches of the service. The majority of applicants in the earlier months of the war were civilian candidates for the several sections of the Officers' Reserve Corps, and, later, with the suspension of hostilities in November, 1918, examinations for this purpose were supplanted by examinations of officers for discharge. The final organization of the physical examination department consisted of an examining team working under the direction and personal supervision of the chief medical examiner. The team was normally composed of 9 medical officers and 5 enlisted men. This number could be increased or decreased quickly and without loss of efficiency to meet sudden and unusual variations in the amount of work thrown upon it from time to time.

Organization of Medical Department units for overseas service.—In addition to the officers and enlisted men sent out from the Army Medical School, both individually and in detachments, for duty in the United States and abroad, four mobile field laboratories were organized and trained at the school and sent overseas. The personnel of these units consisted of 2 officers and 4 enlisted men.³²

ARMY VETERINARY SCHOOLS

It was found that neither the training of enlisted men at the Medical Officers' Training Camp, Fort Riley, Kans., nor the training of officers at the Medical Officers' Training Camp, Camp Greenleaf, Ga., met the needs of a training camp for the Veterinary Corps.³³ The essential requirement was a center wholly given over to the concentration and training of veterinary personnel and for the organization of veterinary units for overseas service. A veterinary hospital and special schools for training noncommissioned officers, farriers, horseshoers, saddlers, teamsters, and cooks were needed.

VETERINARY TRAINING SCHOOL, CAMP LEE, VA.

The establishment of such a school had been under consideration by the Surgeon General for some time, when it received its official impetus from a letter outlining a plan,³⁴ which was forwarded to The Adjutant General of the Army, with recommendation of approval,³⁵ which was received,³⁶ whereupon the Surgeon General announced the following plan for the proposed school:³⁷

* * * * * *

2. The school for Veterinary Corps personnel at Camp Lee, Va., will be known as the Veterinary Training School.

3. Its object is to train officers and enlisted men of the Veterinary Corps and to organize veterinary units.

4. The instruction should proceed along two lines which, though distinct, should be closely correlated: (a) The general military training of the soldier, and (b) the special training required for the veterinary service.

General military training.—As all enlisted men will be recruits, they will need instruction in discipline, school of the soldier, squad and company drill, guard duty, equitation, care of equipment, pistol practice, physical training, personal hygiene, first aid, and the use of gas masks.

Special training.—To prepare them for the special service of the Veterinary Corps, they should at the same time receive instruction in the handling and care of animals, stable practices and management, care of stable and veterinary equipment, care of sick animals in hospitals and elsewhere, first aid and bandaging, administration of medicines, isolation and disinfection in connection with communicable diseases, etc., also in the special duties of farriers, horseshoers, wagoners, and saddlers, and in regard to the paper work of the Veterinary Corps. It is desired that the course of instruction be graded, and that it be uniform for all companies. More advanced courses should be arranged for men of exceptional aptitude who give promise of developing sufficient ability to be considered for promotion to the non-commissioned grades.

5. A period of eight weeks will be allowed for the instruction of the first class to be assigned to the school and for the formation and equipment of the veterinary units named in paragraph 8. The course of instruction should be arranged so that about 90 per cent of the time will be devoted to military training during the first three weeks, after which the time allowed for the veterinary instruction should be increased, at least one-half of each day of the last five weeks being set aside for this purpose. In so far as is possible the classes should be scheduled so that a part of each day will be devoted to classroom work and a part to practical outside work.

6. While the commandant will be responsible for all that pertains to the administration of the school, it is especially desired that the views and recommendations of the senior veterinary instructor, as the senior representative of the Veterinary Corps, be given careful consideration. The highest efficiency can be obtained only by the hearty cooperation of the commandant and the senior veterinary instructor. The senior veterinary instructor is

expected to act as the adviser of the commandant in all matters connected with the school; he is also responsible under the commandant for the veterinary instruction of all of the personnel and will supervise and direct the work of all assistant veterinary instructors, both officers and men. An outline of the subjects which should be included in the course of instruction, showing the time allotted to each, will be prepared and submitted to this office at once, together with a schedule of the classes. Until the base veterinary hospital recommended for Camp Lee is authorized and constructed, the existing facilities of the cantonment may be used for the practical instruction in animal management, care of sick animals, etc.

7. The enlisted men assigned to the school will be organized into eight companies of instruction for the purpose of discipline, drill, training, individual equipment, and subsistence and shelter, with the usual company administration. Each company will have a line officer in command, a veterinary officer, and its pro rata share of the sergeant instructors assigned to the school.

8. The following units are to be organized from the first class assigned to the school: 5 veterinary hospitals (T. O. No. 331); 1 corps mobile veterinary hospital (T. O. No. 109); one-half Army mobile veterinary hospital (T. O. No. 330).

These formations will be organized at the earliest possible date in order that the personnel may have all the opportunity possible to become acquainted with their organization and its duties. In case a sufficient number of men should not be available for the organization of all the above units, those present will be used to organize as many complete units as possible. The assignment of the veterinary and medical officers and of the enlisted men of the Medical Department will be arranged by this office. Further instructions will be arranged by this office. Further instructions will be issued in regard to the authorized hospital equipment.

ORGANIZATION AND ADMINISTRATION

A line officer was detailed as commandant of the school, with the concurrence of the Surgeon General.³³ About the middle of April, 1918, a senior instructor was ordered to report to the commandant of the school for duty, but as there were no school buildings in existence at that time temporary quarters were obtained.³⁵ Between April 14 and 20, 1918, eight veterinary instructors who had received military instruction at the Medical Officers' Training Camp, Camp Greenleaf, Ga., reported for duty at Camp Lee. As none of these veterinary officers had any idea of the kind of work before them, they were taken in hand by the senior instructor, who, for the period of six weeks, by lectures and demonstrations, succeeded in presenting the subject in such a manner that he was reasonably assured of success.

Wooden construction at the service of the school from the beginning included 32 barracks for 52 men each, 8 mess halls for 204 men each, 8 lavatories for 200 men each, 3 officers' quarters for 95 officers, 1 lecture hall, and 1 administration building.³⁸ Two warehouses were available for the supply officer, an infirmary, and a fire house. An exchange was established in a converted dwelling and subsequently enlarged. From time to time further construction was undertaken, using scrap lumber and skilled labor drawn from the enlisted personnel.

The barracks, while sufficient for the housing of the provisional companies, were insufficient to house properly other veterinary units formed. This handicapped the carrying out of that provision for the organization of these formations at the earliest possible date in order that the personnel might have all the opportunity possible to become acquainted with their organization and duties.³⁷ Barracks and mess halls such as were standard in officers' training schools were constructed, but did not fit the tables of organization for veterinary hospital

units, and it was found necessary to house the first units in tents pending their organization by wards. Later, when a school built to accommodate 1,600 men was expanded to a strength of 5,400 without accompanying enlargement in regard to construction of barracks, mess halls, officers' quarters, and lecture halls, it was found necessary for the original allotment of barracks to contain the bulk of the units while the overflow were housed in tents.³⁸

For the greater part of its existence the Veterinary Training School was without hospital facilities; consequently, during this time, practically all veterinary instruction was theoretical; veterinary officers received no practical training in conducting hospitals, or in any part of the administrative work incident to handling sick animals; noncommissioned officers were not trained in directing the work of enlisted men in the feeding, watering, and grooming of hospital patients; farriers had no opportunity to put in practice the teachings of their instructors; enlisted men possessing ability as practical horsemen could be of no assistance in training others deficient in the necessary requisites.³⁸ Presumably labor and lumber shortage accounted for the long delay in building the hospital, construction of which was not actually begun until July 20, 1918.³⁸ It was not complete in every detail even at the time of the signing of the armistice. The actual instruction, however, was carried on despite this handicap.

As soon as the veterinary instruction staff was formed, an equitation class was formed under the tutorship of the senior veterinary instructor. The assistant veterinary instructors assigned to the school composed this class. The first period was held May 28, 1918, and the instruction was continued for two hours each day during the summer. The students were started in the very rudiments of riding, and as they showed progress were gradually advanced until the instructor thought them fit to teach other beginners.

Members of the class were required to know both the theoretical and the practical side of equitation, as the main idea was that they should be able to instruct others. After the usual work at the walk, trot, and gallop, jumping was gradually taken up, until an average jump of between 3 and 4 feet could be taken with the horses at hand. The work in general equitation was continued until the services of most members of the class were required to instruct other classes in riding and horsemanship.

Instruction in equitation was given to 212 veterinary officers, 32 divisional staff officers, 51 medical officers, and 217 enlisted men.³⁸

Line officers were assigned as instructors to the school, despite its character as a center primarily of veterinary instruction, for purposes of administration, discipline, and drill, the building up of units which, while efficient in their chosen work, should be as strictly military as those of the line. The Tables of Organization provided for units that had to be handled with the care and precision of Infantry companies, that required setting up, instruction in marching, pack making, tent pitching, personal hygiene, and care of equipment, military discipline, and courtesy.³⁸

At the time the school was organized, there were available for duty line officers who were graduates of the second officers' training camps at Plattsburg and Fort Myer, who had been serving as attached officers in the 79th Division at Camp Meade, Md. These had undergone three months' intensified train-

ing in the officers' camps and had served more than three months in the division. They had thus gained sufficient experience, under the exigencies of the existing emergency, to qualify them, in the opinion of the division chief of staff, for the work at the Veterinary Training School.

The authorized training cadre consisted of the following officers and enlisted men:³⁶ 1 colonel or lieutenant colonel, line officer, as commandant; 1 captain or lieutenant, National Army, as adjutant; 1 major, Medical Corps; 9 veterinarians, majors, captains, or lieutenants, as instructors; 9 captains or lieutenants, National Army, to command companies; 1 captain, Quartermaster Corps, for supply duty; 1 lieutenant, Quartermaster Corps, for supply duty; 3 sergeants, Quartermaster Corps, 1 sergeant as sergeant major; 2 corporals as clerks at headquarters; 58 sergeants as assistant instructors; 20 cooks; 1 horseshoer; 1 saddler.

The 101 sergeants, corporals, farriers, and cooks who constituted the enlisted training cadre were transferred to the school from line outfits.³⁹ Details of these noncommissioned officers policed camp, improved sanitary conditions, cleared drill fields of vegetation, drained swamps, and cut and burned tangled underbrush.

In September, 1918, the following personnel was authorized to replace the list of permanent personnel set for the above:⁴⁰

(a) Personnel for training school: 1 colonel or lieutenant colonel, line officer, commandant; 1 captain or lieutenant, line officer, as adjutant; 1 major, Medical Corps, surgeon; 10 veterinary officers, majors, captains, or lieutenants, as instructors (includes 1 officer for horseshoeing instructor); 9 captains or lieutenants, line officers, to command companies; 1 captain, Quartermaster Corps, for supply duty; 1 lieutenant, Quartermaster Corps, for supply duty; 3 sergeants, Quartermaster Corps; 1 sergeant, first class, Veterinary Corps, as sergeant major; 8 sergeants, first class, Veterinary Corps, as assistant instructors and acting first sergeants; 1 sergeant, first class, Veterinary Corps, personnel sergeant; 51 sergeants, Veterinary Corps, as assistant instructors (including 1 as saddler instructor); 1 sergeant, Veterinary Corps, as provost sergeant; 1 sergeant, Veterinary Corps, in charge of post exchange; 1 sergeant Veterinary Corps, personnel duty; 2 corporals, Veterinary Corps, clerks; 20 cooks, Veterinary Corps; 1 horseshoer, Veterinary Corps; 1 saddler, Veterinary Corps; 2 privates or privates first class, Veterinary Corps.

(b) Personnel for veterinary hospital: 1 major or captain, Veterinary Corps, as commanding officer; 1 lieutenant or captain, Veterinary Corps, as adjutant and detachment commander; 1 lieutenant or captain, Veterinary Corps, as supply officer; 3 lieutenants or captains, Veterinary Corps; for ward service; 1 sergeant, first class, Veterinary Corps; 5 sergeants, Veterinary Corps; 5 corporals, Veterinary Corps; 2 cooks, Veterinary Corps; 10 farriers, Veterinary Corps; 1 horseshoer, Veterinary Corps; 1 saddler, Veterinary Corps; 4 wagoners, Veterinary Corps; 17 privates, first class, Veterinary Corps; 34 privates, Veterinary Corps.

April 16, 1918, the commandant and 12 officers (10 line, 2 of the Quartermaster Corps) arrived to assist in organizing the school.³⁹ The construction was probably 20 per cent complete; no plumbing had been installed and quarters contained no windows. An adjutant was detailed and suitable noncommissioned officers selected as sergeant major and clerks. With their assistance the organization of headquarters proceeded. Pending receipt of recruits, all enlisted training cadre men at hand were assigned to the First Provisional Company, employed in general fatigue work.

Provisional companies were organized, a line officer commanding each, and veterinary officers assigned equitably for instruction as they reported.³⁹ A like distribution of training cadre noncommissioned officers was made. Various schools for specialists were created, and instruction of classes commenced.

On May 21 the order assigning the officers and men to the various provisional companies was issued from headquarters.³⁹ At the same time the noncommissioned officers were assigned, and there was a tentative assignment of veterinary officers to the eight companies. After the order was issued the noncommissioned officers, cooks, and farriers reported to their respective company commanders at barracks. The tent camp was abandoned. The work of organizing the companies began immediately, and on the 1st of June they were ready to receive the allotment of men who began to arrive at that time.

INSTRUCTION

Courses of instruction comprised veterinary and military work, the former, of course, being considered the more important because of the nature of the troops to be turned out.⁴¹ In the interests of producing disciplined and manageable units, however, at the earliest possible moment, the military work received the greater emphasis in the opening stage of the school's work, the veterinary instruction gradually growing in importance until the two courses divided the time about equally. The schedules provided for a 44-hour week, and they were adhered to carefully until the appearance of the influenza epidemic demanded a general cut in all work.

Military instruction as provided for by a condensed schedule from the Surgeon General's Office included the following subjects:⁴¹ Articles of War; military discipline and courtesy; uniforms and equipment (issue, care, and use); personal hygiene; school of the soldier; school of the squad; school of the company; physical training; guard duty; equitation; pistol (nomenclature, care of, manual, practice on range); first-aid; pack making; tent pitching; gas poisoning and use of gas mask; inspections; singing; lectures. All these subjects were thoroughly taught with the exception of the pistol. It was found impossible to obtain pistols and the instruction in this respect was theoretical and conducted by the company commanders with the assistance of experienced training cadre sergeants.

The general veterinary instruction of officers and enlisted men was conducted, to a large extent, in the open under improvised sunshades; during inclement weather the lecture hall and mess halls were utilized and later the auditorium of the Young Men's Christian Association.⁴¹ While much of this instruction had, of necessity, to be theoretical, due to the lack of a veterinary hospital, every effort was made to introduce into it the practical element so essential to the thorough understanding of the subjects presented. A haltered horse was kept before the classes at all talks, demonstrations, and lectures, and advantage was taken of the facilities offered for practical instruction by the auxiliary remount depot and stables in the vicinity of the school.

OFFICERS

Officers were trained in the following lines:⁴¹ Organization and object of the Veterinary Corps; instruction of enlisted men; military veterinary sanita-

tion and police; post-mortem examination; control of communicable disease, special attention being given to glanders, mange, and influenza; construction of temporary shelters and corrals; the proper shoeing of public animals; dipping tanks, their use and upkeep; military correspondence; requisitioning for veterinary supplies; veterinary reports and returns; Special Regulations No. 70 and Changes No. 1; accountability and responsibility; memorandum receipt; customs of the service; routine stable management; feeds, feeding, and watering; care of animals in the open; transportation by sea and rail; Army Regulations; general and special duties of veterinary officers; saddles and bridles; equitation, elements of; esprit de corps.

NONCOMMISSIONED OFFICERS, FARRIERS, AND FIRST-CLASS PRIVATES

In addition to the general course for the enlisted personnel, selected men were given the following special course:⁴¹ Elementary equine anatomy; physiology, popular form; elements of pharmacy and materia medica; administration of medicines; minor surgery; lameness and its diagnosis; temperatures and use of thermometer; bandaging and dressing; suturing and ligation; veterinary first aid; care of instruments and supplies; sanitation of wards and corrals; responsibility for public animals; memorandum receipt; methods of securing animals for operations; humane handling of animals; respect for military authority; prompt and cheerful obedience; discipline of men; personal appearance and pride; organization and duties of the Veterinary Corps.

GENERAL ENLISTED PERSONNEL

The enlisted personnel received instruction in the following subjects:⁴¹ Exterior of the horse; stable management; haltering, tying, grooming, bedding; feeding, watering, salting, exercising; animals on the march; picket lines and corrals; horse clothing; care of the feet, scratches; pulse and respiration; communicable diseases, dangers of; transportation of animals; improvising shelters; conservation of forage; bran mashes, chop feed, night watering; simple wounds; bridles, saddles, and blankets; the pack saddle and mounted kit; saddle and collar galls; veterinary first aid; the age as indicated by the teeth; fitting of harness; organization and duties of the Veterinary Corps; discipline.

Horseshoers.—Men selected for horse shoers were given intensive training at the Auxiliary Remount School under the supervision of a veterinary officer detailed from the school.⁴¹

Horseshoeing school.—The horseshoeing school was organized July 23, 1918. The object of the school was to instruct and qualify men in horseshoeing for the various Veterinary Corps units which were fast being organized and equipped for overseas service. On account of the lack of facilities and equipment for conducting the horseshoeing school on the Veterinary Training School premises, the men were instructed at the Remount School at Camp Lee, but under the supervision of the Veterinary Corps of the Veterinary Training School. The graded course of instruction could not be followed, owing to the fact that the various units were prepared on such short notice and time did not permit of carrying out the routine as per schedule.

Wagoners.—As many of the men were well accustomed before entering the service to driving two or more animals in harness, no difficulty was experienced in securing and instructing a sufficient number of competent wagoners.⁴¹

Saddlers.—The tables of organization for the units to be sent overseas called for saddlers, and it was therefore necessary to start a school for the instruction of men in this line of work.⁴¹ A temporary shed was built on the rear of the warehouse building, and a school started in the early part of June, 1918. A few saddlers' kits, leather, rivets, etc., were obtained from the supply officer, and a saddler was assigned to give instruction to the men. The school was started with an average attendance of 20 men, and during the existence of the Veterinary School a like number of students was under training at all times. The instruction consisted principally in making wax ends, sewing, reveting, repair work, etc., although some of the more apt pupils were allowed to attempt new work. The main object of the school, however, was to train the men to care for and repair the leather equipment of their respective units when ordered overseas.

Equitation.—Horses were obtained and, after procuring the other necessary equipment, including regulation Cavalry bridles, McClellan saddles, etc., compulsory attendance of the veterinary officers was required at classes from 7 to 9 or 9.30 a. m. each day, depending upon the balance of the schedule.⁴¹ These classes proved highly beneficial, and at the end of several weeks' training the officers were considered capable of taking the mounted classes and teaching them the fundamental principles which a mounted man must know to be able to ride with the proper degree of comfort and safety.

Following talks on the handling, care, and treatment of mounts, with emphasis on the fact that few horses are really vicious and are apt to react to the disposition and temper of the rider, the classes of veterinary officers and enlisted men were given instruction in and required to know by name every part of the bridle, saddle, and mounted equipment used, following the outline exactly as laid down in Cavalry Drill Regulations. Having mastered this, they next received individual instruction in folding blankets, saddling, bridling, and biting a horse properly and in acceptance with the same regulations. After two or three periods devoted to this work, each man's equipment was inspected as he took his place in line, and those unable to adjust it properly and find their places in line within the 10 minutes' time allowance were placed in an awkward squad and there held until proficient. Next the pupils were taught how to hold the reins, to lead out and to stand to horse, how to grasp the reins when the hands were placed on the saddle pommel and on the neck preparatory to mounting and dismounting, the position of the hands and reins mounted, and the use of the aids in starting and halting from a walk. This was taught in the stable corrals where animals could be easily controlled, and further instruction, except unsaddling, tying of horses on picket line, proper care and return of equipment, was given in the field on the circle.

Groups of from 5 to 10 students were taken in charge by each instructor and during the first three weeks worked largely on the circle, perfecting the seat, use of aids in turning, starting, and stopping the animal, and in changing to and through the different gaits. During the first week the work was nearly

all done at a walk, and the men were constantly cautioned to hold the reins correctly and remember the following six points: Body loose, hands down, thumbs up, elbows in, legs back, heels down. The Samur seat, used in the French Army cavalry school and later adopted by our own mounted service school, was the only one taught, and with the advantage of always having the legs on the horse undoubtedly prevented many falls.⁴¹

As soon as the men were individually and collectively able to handle the mounts properly, mounted drill formations and road rides were employed to smooth out and perfect the points taught, and these soon accustomed the riders to the faster gaits. The next thing taken up was the jumping of hurdles from 1 to 4 feet in height, and ditches 3 to 4 feet wide. This necessitated considerable care, as the horses as well as the men had to be trained gradually. None of the 125 animals were schooled jumpers, having been picked up out of the Cavalry corrals, but they proved, with a very few exceptions, to be well suited to all kinds of work.

In August, 30 new flat French training saddles were received and the men had an opportunity to use these in addition to the McClellan.⁴¹ Cross-country rides over a regular course on Sundays were encouraged, and a ribbon was awarded as a prize to the winner.

MILITARY TRAINING

Schools for the instruction of the veterinary officers in matters purely military had been built up to meet a very obvious need. The first contingent of these officers came to the school much better prepared in this respect than was the case in subsequent outfits.⁴² Furthermore, arriving as they did well in advance of the enlisted men, it was possible to polish up their drill considerably before it was necessary for them to plunge into the work of the provisional companies. Much of great and enduring value in the way of discipline was implanted at the beginning by the senior instructor, by lecture and otherwise, and this was supplemented by drill and brief hikes. At this time the Sanitary Drill Regulations were in force, and the simple movements were taken up and dwelt upon at length. Thus in working up the first provisional companies and turning out from them the first overseas units, it was possible to build the new veterinary officers into the organization from the beginning. At the same time there were in the ranks graduate veterinarians who by their later work showed the value of their experience as privates in the ranks in these early days of the school's work. Throughout the first month, it was possible to bring the military efficiency of the veterinary officers along at the same rapid rate as the men, as officers actually in command, and without added instruction, for which indeed there was literally no time whatever. Later there were fresh arrivals from Camp Greenleaf who seemed not to have made so much out of their course there, and new officers from civil life who were utterly strangers to military drill and discipline. It was the rapidly growing proportion of these men that necessitated specialization of officers' schools.

That the proper emphasis might be placed upon the work, the veterinary instructors were required to attend the military classes and drill so far as such duty did not interfere with the purely veterinary work.⁴² The senior veterinary

instructor was insistent at all times upon the importance of the purely military side of the school and lent powerful aid to the senior instructor in military training. Thus the placing of his own assistants in the military classes by the senior veterinary instructor, until such time as they were excused through passing a satisfactory examination, was of the greatest value in bringing up the morale of those officers.

In the drill periods the form of instruction in use in the line officers' training camps was closely followed.⁴² For the purposes of the drill, the officers were all classed as privates. They were formed into two or more platoons, according to the total number available, and placed under the instruction of from 1 to 4 line officers under the general supervision of the senior instructor in military training.

At the same time evening classes were held, these including both study and lecture.⁴² The lectures were given by the line officers along the lines of the lectures they themselves had attended in their own training camps. There was persistent instruction in guard duty and drill, and there were lectures on courts-martial, Army paper work, Field Service Regulations, Army Regulations, and kindred necessary subjects. Emphasis was laid from time to time on those subjects in which the daily experience of the school showed the officers to be weak.

GAS INSTRUCTION

The first contingent of veterinary officers was well qualified to instruct in gas, when the officers' classes were formed; it was found advisable to put every officer through the course. This was done with the assistance for a time of officers from the Infantry School of Arms at Camp Lee.

ON THE MARCH

Practice marches, so vital a feature of Infantry instruction and training, were not authorized in the original synopsis of the schedule sent down from the Surgeon General's Office covering the military work of the proposed eight weeks' course, nor were they in effect in the course of training given to the first overseas units.⁴² In the course of this preparation, there seemed to be no need for them. The men responded so rapidly to the conditioning process of the existing schedule, the discipline was so satisfactory, and the time was so crowded that it is doubtful if practice marches would have improved these units to any appreciable extent, while they would undoubtedly have occupied much time that could have been and in fact was used to advantage otherwise. The only real road test was the short march to the first post of embarkation, and this was most satisfactory. When the personnel was kept so long awaiting orders for overseas after having been reported in readiness, it was deemed necessary for disciplinary purposes, as well as for the purpose of instruction, to take up practice marches. The men were in quarantine most of the time, and this quarantine was irksome in the extreme. It was felt to be a healthy plan to get them away from the camp from time to time, and it was felt, too, that road work, with carefully taught march discipline, was necessary to keep the men hardened, as well as to keep at top notch the esprit de corps which long close confinement to camp has a

well-known tendency to diminish. Therefore, after consultation with the commandant, the practice marches were instituted, at first by unit and then as a battalion.

These marches were held in conformity with the provisions laid down in Field Service Regulations, beginning with "hikes" that averaged about 4 miles, 2 miles out and 2 miles in; and were finally worked up to a "hike" of 15 miles, the entire day being spent in the field.⁴² The column consisted of 5 full hospital units of 300 men each, and the 2 smaller mobile units, totaling a little below 200. Thus the column was considerably larger than an Infantry battalion, albeit handled quite as easily. In the course of these marches the opportunity was seized to drive home the lessons of personal hygiene, care of equipment, and care of the feet. There were individual cases that provided concrete examples on which the unit commanders might enlarge in their lecture.

Coincident with these marches, other rapidly formed units were getting settled in camp contiguous to that of the Third Battalion.⁴² For purposes of administration, this personnel was denominated the Fourth Battalion, and was under command of the commander of the Third Battalion who was the senior instructor in military training. This Fourth Battalion was so occupied with its immediate intensive training that it did not participate in the road work, but was later taken out to the main drill field for battalion drill in the interests of mass instruction for both men and officers.

The road work was planned to be progressive.⁴² The pace was always easy, generally at a cadence of 112 to the minute. The battalion marched out of and into the school area at attention, and occasionally 20 minutes or so of the "hike" was conducted at attention and at a cadence of 120 to the minute. In order to occupy the minimum road space the ranks were closed to 40 inches, and file closers followed in the rear of the units. Unit commanders marched in front of their units, with the result that the column invariably presented a front of a single set of fours. It is believed that these practice marches were of the utmost value to both officers and men. Besides accustoming the men to the proper adjustment of equipment, the subordinate commanders were practiced in maintaining control of their men at the roadside halts, there was practical demonstration of the advantages of the sparing use of drinking water, the men were hardened appreciably as was evidenced by the rapidly decreasing number of fall-outs for any cause, and the morale of the whole battalion was appreciably improved. The column came in singing, and when dismissed the men went shouting to the bath, which was followed by careful foot inspection. Incidentally, the sick list was cut down materially.

Something of the competitive spirit was in evidence, as that unit which came in in the best order at the conclusion of a "hike" was designated to lead the column on the next succeeding "hike", and there was plenty of rivalry for the post of honor. Further to stimulate the interest of the men, new road formations were devised providing for columns of files at each side of the road, presumably to defeat aerial observation. Before the battalion left the camp these formations were rapidly and accurately made at the whistle signal. Thus the idea of marching at the "alerte" was implanted.

The longest "hike" was of 15 miles, $7\frac{1}{2}$ miles each way, to a farm on the Petersburg-Norfolk road, where the midday meal was eaten.⁴² On this "hike" one of the smaller units was used as an advance guard to further simulate war conditions. There was the added advantage of practice in the designation, prompt reporting, and use of the customary camp details for wood, water, kitchen, latrine, outguard, and other functions. Fortunately, the column left camp in a thick fog, which gave opportunity for testing connecting files and the customary means of communication from head to rear of the column. This day in the field was both valuable and enjoyable. The condition of the men was shown by the fact that there were only two stragglers, and these came in under their own power in charge of a noncommissioned officer only half an hour after the arrival of the rear of the column.

Much more of this work would have been attempted, and for longer periods, had it not been for insuperable obstacles arising from local conditions, notably the lack of proper transportation at Camp Lee for field ranges, etc., and a subsequent order forbidding units in overseas uniform appearing beyond the boundaries of the camp.⁴²

In the interests of a real test of the discipline of the Third Battalion, one night march was held under simulated war-time conditions.⁴² The route was 3 miles out and return on the road to Petersburg. From start to finish this march was conducted in silence, necessary commands being given by a pre-arranged code of hooded flashlamp signals. The men looked upon it as a "stunt" and were interested and enthusiastic. The most exacting march discipline was cheerfully maintained throughout.

It was deemed advisable from time to time to take the battalion out at short notice, thus accustoming both men and officers to promptness in reporting readiness to move. In the end the instruction staff felt that this sort of training was as valuable for troops of this character as for Infantry, and that it was especially noticeable in the effect on the morale at a time when completely equipped overseas units were chafing under strict quarantine awaiting orders to move for the port of embarkation.

Just at this time even the officers of overseas units were attending officers' drill, thus leaving the units for a part of the day in sole charge of their noncommissioned officers. This condition was seized upon for a further polishing of the latter. In order that their handling of the units at drill might be uniform throughout both the Third and Fourth Battalions, the noncommissioned officers were drilled as a company for an hour in the evening three times a week.⁴² They entered into the work in a hearty spirit of cooperation and carried the lessons learned back to their units with them. This special training would have been continued indefinitely but for the advent of the influenza epidemic. As it was, the work bore fruit, as it happened that on the day the commanding general made an inspection of the camp the units were drilling under their noncommissioned officers, while on another field the veterinary officers were drilling under command of the line officer instructors. The general expressed gratification at the work of the noncommissioned officers acting as company and platoon commanders, and was surprised to learn that they were practically all home-made products of the Veterinary School's training.⁴²

Another feature of the training was the drill by battalion, of the Third and Fourth Battalions. These organizations were broken up into battalions of convenient size for the rather restricted main drill field, providing four battalions in all. These battalion drills were supplemented by ceremonies which included the required inspections on Saturday mornings, and there followed week end after week end when the Third Battalion appeared in full strength, primed and fit for overseas orders. The influenza epidemic subsequently meant the breaking up and radical reorganization of the enlisted personnel of this Third Battalion, but there was a long period when it stood ready to move, thoroughly equipped and drilled and possessed of a morale that was gratifying in the extreme to its officers and instructors. Thus the battalion drill added to the schedule like the practice march may be said to have served a useful purpose.

VETERINARY HOSPITAL

A necessary part of the training of veterinary officers and men must be given in a practical manner. This was anticipated, and a modern veterinary hospital with adequate facilities for caring for the public animals of Camp Lee, including those of the auxiliary remount depot, was planned and authorized.⁴³ It was officially termed the "camp veterinary hospital," and originally was destined to become a part of the Veterinary Training School. Authorization of this part of the Veterinary Training School was made on March 22, 1918,³⁶ but construction of building was long delayed because of a labor shortage and the delay and difficulty in procuring building materials. In fact, construction of essential parts of the hospital buildings was not complete at the time the armistice was signed.⁴³ The following buildings were constructed:⁴³

Administration.—A standard type 5-room structure.

Officers' quarters.—Two 5-room buildings, each equipped with kitchen, pantry, dining room, and bath.

Enlisted men's barracks.—Two 2-story buildings of standard type, sufficiently large to house comfortably the 80 enlisted men of the command.

Mess hall for enlisted men.—Of standard type and large enough to accommodate 200 men.

Receiving and issue ward.—For the stabling of patients before their discharge or consignment to other wards for treatment. This ward had a capacity for standing 58 animals.

Medical ward.—Stalls for 100 animals, especially constructed stall for patients that are down, and a dispensary. In this, as in all other wards, there were installed electric lights and suitable provisions made for ventilation and drainage.

Surgical ward.—This ward was the largest and best-equipped ward of the hospital. It was built with the same kind of standings as the medical ward (concrete and cork-brick) and had the same facilities for the comfortable stabling of 100 animals. A connected operating unit was built and a well-lighted, steam-heated room for the handling of surgical cases was provided. This included an office for the ward surgeon and his sergeant, a dispensary and store-room, a sterilizing room, and a separate room for dressing wounds and for handling certain minor surgical cases. Connected with the operating unit was

a recovery stall for patients requiring special attention after having been anesthetized.

Contagious wards.—Three wards specially constructed for handling animals suffering from communicable diseases, each with stall room for 68 animals, formed a very essential part of the hospital.

Isolation ward.—One building capable of stabling 44 animals, built on the same plan as the contagious wards and located in the same vicinity. A double fence surrounded contagious and isolation wards in order to minimize the possibility of the communication of infectious diseases from animal to animal by direct contact. This same plan was utilized as a safeguard for contagious corrals located away from the wards.

Hospital stable.—For stabling animals used for hauling wagons and other necessary work at the hospital; also for stabling riding horses.

Forage barn.—A large building for storage of forage and so arranged that specially prepared feed could be supplied sick animals.

Hay shed.—For storing large quantities of hay and straw for animals treated at hospital.

Mortuary.—A well-constructed building for post-mortem examinations.

Yard offices.—For receiving and recording animals at the various wards. Also used for storing forage for daily use and apparatus such as gear, grooming, and feeding utensils.

Dipping vat.—For dipping animals in treatment of parasitic skin diseases. Not completed at time of the signing of the armistice.

Exercising ring.—Intended for a part of the work of conditioning patients before being discharged from the hospital. This also was not completed.

Septic tank and filtering bed.—For the sanitary disposal of sewage. The tank was completed in time for use, but the gravel bed was not put in operation.

ORGANIZATION

The hospital organization was effected with a twofold object in view—to give all necessary treatment to animals of the camp that required treatment and to train officers and men composing hospital units scheduled for overseas service.⁴³ Therefore, the personnel of the camp veterinary hospital was expected to manifest efficiency both as practical men in handling sick and injured animals and in giving practical instruction to those assigned to this hospital for training. It was intended that units in training at the Veterinary Training School would be sent to the camp veterinary hospital daily for instruction; such instruction to be of a practical nature. Officers were to receive instruction in practical administrative duties of a military character and also in the scientific work of conducting an army veterinary hospital. Noncommissioned officers in training were scheduled to work under the guidance of noncommissioned officers of the camp veterinary hospital. Likewise farriers, wagoners, and privates were to be taught, practically, all that was expected of them, to the end that they might become efficient in their respective duties before being sent overseas.

On February 15, 1919, all school records were transferred to the office of the personnel adjutant, Camp Lee, Va. The Veterinary Training School was closed formally at 5 p. m. February 15, 1919, and ceased to exist as an organization.⁴⁴

ENLISTED MEN WITH SPECIAL INSTRUCTION

Cooks, saddlers, horseshoers, and farriers transferred from Fort Riley, Kans.: Cooks, 24; farriers, 4; horseshoers, 42; saddler, 1.

Cooks were given special instruction at Cooks and Bakers School, Medical Officers' Training Camp, Fort Riley, Kans., and were given practical examination before being permitted to discontinue course of instruction.

The following number of enlisted specialists received instruction and were assigned to units at the Veterinary Training School: Cooks, 94; farriers, 744; horseshoers, 187; saddlers, 64.

VETERINARY SCHOOL OF MEAT AND DAIRY HYGIENE, AND FORAGE INSPECTION, CHICAGO, ILL.

Prior to the Spanish-American War very little attention was devoted to the adequate veterinary examination of meats and dairy products for the military forces of the United States.⁴⁵ Subsequent to that period and very largely resulting from the experience gained during the Spanish-American War, a system of meat inspection was evolved which enjoined subsistence officers to familiarize themselves with meats, meat food and dairy products, and the various methods and practices involved in their preparation. This system included the employment of a limited number of qualified veterinarians at the important packing centers to supervise the preparation of meats, and courses of instruction occasionally were given by them to commissioned and noncommissioned officers of the subsistence department. Each of these courses covered a period of four to six weeks and the subject matter taught included principally the cuts and grades of fresh and cured meats. The practical and essential points concerning these products were reviewed in as thorough a manner as the limited time would permit.

The consolidation of the subsistence department into the Quartermaster Corps took many of the trained subsistence officers out of this special line of work and placed the responsibility of the inspection of meats very largely upon veterinarians who had been specially trained and had experience along these lines.⁴⁵

All recognized veterinary colleges in the United States at the beginning of the World War were conducting courses in meat and dairy hygiene, but few of the graduate veterinarians in 1917 were at all familiar with military requirements.⁴⁶ Up to that time little effort had been made to instruct the Army veterinarians along this very important branch of his profession, and there had been a lack of uniformity in the work accomplished.

As an emergency activity of the World War a school for veterinary personnel in meat-and-dairy hygiene and in forage inspection was found necessary. Chicago, Ill., was considered the most suitable place for the operation of a school of this kind, because the efficient training of veterinary officers and enlisted men in all the sanitary and procurement phases of military meat and dairy hygiene could be conducted there at the large depot where supplies were being purchased and handled in quantities in a huge packing house, products manufacturing, and dairy center.⁴⁶ Chicago was the most important procurement point for meat food supplies and forage; it assured access to the stockyards, large packing houses, products manufacturing concerns, dairy farms, public health laboratories, grain elevators, and hay warehouses, and insured a large number of students for instruction at one time, and these facilities were not available or obtainable elsewhere. Furthermore, at the Chicago supply depot all the advantages of direct contact with veterinary officers and enlisted men assigned inspection duty and who were actively engaged in making inspections were available. Therefore, in August, 1917, a school in military meat and dairy hygiene and in forage inspection for veterinary officers was established at the general quartermaster depot, Chicago, Ill., under the supervision of the depot veterinarian.⁴⁶

Later in 1917 a similar school for enlisted men was started at the same place.⁴⁶ Most of the enlisted men inducted for this service were exceptionally good packing-house men, well qualified and with considerable training in this particular line.

Selected veterinary officers were first detailed to this school in August, 1917, received intensive instruction until considered proficient, and then were detailed to organizations going overseas, and to divisional cantonments, stations, and procurement points in the United States.⁴⁶ Successive classes of officers and enlisted men were trained in this school for periods of from six weeks to three months until the formal authorization in July, 1920, of the Veterinary School of Meat and Dairy Hygiene and Forage Inspection.⁴⁷ The students were given individual, practical instruction in the packing houses and products establishments. This instruction was supplemented by daily lectures and conferences. From August, 1917, to November 11, 1918, 82 veterinary officers and 96 enlisted men completed instruction in this school.⁴⁶

The instruction given included lectures, practical work and demonstrations, and quizzes in the following:⁴⁶

Organization and administration of the veterinary meat and dairy hygiene and forage inspection service at points of procurement, at supply depots and at stations.

Sanitary inspection of establishments as to location, construction, equipment, and methods of operation.

Ante-mortem inspection of food animals, including marketing agencies, 28-hour law, transportation of food animals, their receipt at destination, market classes and grades of livestock, quarantine, and sanitary and procurement ante-mortem examinations.

Slaughter of food animals.

Post-mortem examination of food animals, disposition of diseased carcasses and parts, and denaturing rejected products.

General-products inspection; reinspections; authorized ingredients; branding; laboratory examinations; miscellaneous products as gelatin, mincemeat, beef extract, bouillon cubes, rabbits; and the sanitation of inedible compartments in official establishments manufacturing neat's-foot oil, glue, tallow, greases, tankage, and fertilizer.

Fresh beef, veal, mutton, and pork.—Offal, carcass meat, wholesale cuts and trimmings as to sanitary source; selection; classes, grades; grading for condition, quality, and weight; dressing; branding; chilling; trimming; boning; freezing; defrosting; covering; packing; stamping of packages; handling; storage; shipment; receipt; issue; veterinary, sanitary, and procurement examinations; reinspections; action; manufacture of ice.

Cured pork and beef products, considering especially Army bacon, hams, shoulders, salt pork, corned beef, dried beef, salt beef, ox tongue, meat flour, tripe, and other cured products as to veterinary, sanitary, and procurement examinations; sanitary source of products; selection; grading for condition, quality, trim, and weight; cutting; trimming; grading for cure; authorized curing ingredients; pumping, placing into cure, overhauling, manufacture of curing mixtures or solutions; brushing; washing; labeling; hanging; smoking; weighing; wrapping; packing; stamping of packages; handling; storage; shipment; receipt; issue; sanitary and procurement requirements; reinspections and action.

Canned meats, including roast, corned, and dried beef; corned beef hash; ox tongue; meat flour; Army bacon; pork for beans; fresh pork sausage; Vienna style sausage; veal loaf and other canned products as to sanitary source; soundness of ingredients used, cutting, boning, soaking, curing, pickling, cooking, trimming and sorting of meats; cans, their construction, size, cleanliness, stuffing, weighing, sealing, exhaustion and sterilization; examination of finished canned products as to defects of manufacturing, lacquering and labeling; weighing; packing; development; handling; storage; shipment; receipt; issue; sanitary and procurement requirements; reinspections and action.

Rendered meat products, considering oleo stock; oleo stearine; oleo oil; edible tallow; prime steam, refined, neutral, kettle rendered, dry rendered and hydrogenated lards; lard compound; margarines and lard substitutes, as to sanitary source; authorized ingredients, including selection, soundness, grading for condition, quality and quantity; the washing, trimming, handling, chilling, hashing and rendering of fats; the settling, drawing off, clarification, bleaching, filtering, cooling, seeding and pressing of oils; manufacture and Pasteurization of starter; weighing, mixing, and churning ingredients; crystallization; tempering; working; blending; packing; crimping; weighing; strapping; branding;

handling; storage; shipment; receipt; issue; laboratory examinations; sanitary and procurement requirements; reinspections and action.

Sausages, including fresh, smoked, cooked and dry sausages, cooked meats, pork products customarily eaten without cooking and other sausage-room products, considering ingredients used, as casings, meats, spices, preservatives, cereals, water and dyes; their sanitary source, selection, preparation, grading for condition, quality and amount, their curing, freezing, defrosting, grinding, trimming, chopping, boning, mixing, stuffing, or other preparation; wrapping; smoking; cooking; chilling; washing; drying; branding; handling; weighing; storage; shipment; receipt; issue; laboratory examinations; sanitary and procurement requirements; reinspections and action.

Poultry, live, fresh dressed, frozen, and canned; including their sanitary source; classes; shipment; fattening; ante-mortem and post-mortem examination; slaughter; plucking; chilling; weighing; grading; drawing; packing; freezing; storage; defrosting; canning; handling; receipt; issue; sanitary and procurement requirements; reinspections and action.

Eggs, including fresh, sterilized-shell-processed, frozen, desiccated and preserved eggs, as to structure, production, characteristics, candling, classes, grades, handling, packing, storage, shipment, receipt, issue, sanitary and procurement requirements, reinspection, and action.

Marine products, including fresh, frozen, cured, and canned salmon, sardines, codfish, mackerel, anchovies, caviar, herring, tuna, fish flakes, crab meat, clams, oysters, lobsters, halibut, shrimp, and other fish and sea foods, as to sanitary source; acquirement; handling; dressing; chilling; packing; shipment; storage; freezing; defrosting; curing; canning or other preparation; receipt; issue; sanitary and procurement requirements; reinspections and action.

Milk, including fresh, whole milk, skim milk, cream, whipping cream, certified milk, inspected milk, Pasteurized milk and cream, condensed milk and cream, powdered milk, reconstructed milk, malted milk, and ice cream, as to standards, composition, adulterations, laboratory examinations, production, sanitary dairy farm examination, tuberculin testing of dairy animals, sanitary inspections of collecting depots, creameries, and Pasteurizing plants; ingredients, processes of manufacture, classes, grades, handling, packing, storage, shipment, receipt, issue, sanitary and procurement requirements and action. Some of this instruction was carried on under arrangements made with the health department laboratories of the city of Chicago.

Butter, including sanitary source; selection, sampling, testing, grading, standards, and adulterations of ingredients used; the receipt, weighing, grading, mixing, heating, ripening, and churning milk or cream; the salting, washing, working, testing, weighing, canning, scoring, wrapping, packing, labeling, storage, handling, shipment, receipt, issue, laboratory examinations, sanitary and procurement requirements; reinspections and action.

Cheese, including American Cheddar type, pimento, Camembert, Swiss, Edam, canned and other cheese, as to sanitary source, methods of manufacture, classes, grades, scoring, standards, adulterations, selection, handling, storage, shipment, receipt, issue, sanitary and procurement requirements; reinspections and action.

In addition to the above training, in February, 1918, a special class of five veterinary officers was organized under two experienced veterinary officers who were specialists in the manufacture and inspection of butter.⁴⁶ These five officers were intensively trained in this work so that in May and June of that year they supervised the manufacture and canning of more than 1,000,000 pounds of creamery butter. This class rendered additional valuable service on butter inspection. In September, 1918, when the Army commandeered 80 per cent of the butter in the United States in cold storage, these veterinary officers selected, graded, weighed, inspected, and certified for payment 6,217,897 pounds of butter and more than 3,000,000 pounds of cheese, valued at more than \$3,781,000.⁴⁶

The importance of the training of veterinary personnel in meat and dairy hygiene is shown by the inspections maintained by the Veterinary Corps from April, 1917, to March 31, 1919, as follows: At purchasing points, 1,261,728,441 pounds of meats and dairy products, having a money value of \$473,914,827.62, were inspected and passed for food; at stations, 234,153,619 pounds; for the Italian Government, 976,687 pounds of fresh, frozen beef; and for civilian relief work in Europe, inspected and supervised the packing and shipment of 31,454,566 pounds of meat. In addition, 10,956,408 pounds were rejected, making a grand total of over one and one-half billion pounds of meats and dairy products inspected by trained Army veterinary personnel during this period.⁴⁶

VETERINARY LABORATORY, PHILADELPHIA, PA.

A veterinary laboratory was established at Philadelphia, Pa., in January, 1918, with a major, Veterinary Corps, in charge.⁴⁸ Laboratory rooms were loaned by the University of Pennsylvania, and equipment and supplies were furnished by the Medical Department. The main purpose of the laboratory was to conduct research in the etiology, prevention, and treatment of equine influenza, pneumonia, and strangles. With a view of supplying veterinary laboratory service at all the department laboratories, several officers of the Veterinary Reserve Corps, specialists in laboratory procedures, were ordered to active duty at the Philadelphia laboratory for about six week's intensive instruction in uniform technique. At the completion of this course these students were assigned to department laboratories.

The research problems studied included experiments with the intradermic mallein test and its effect upon subsequent serological tests for glanders, with various veterinary biological products, the value of acetic acid in the treatment of *B. necrophorus* infections, and the development of a bacterin for use in the control of equine infectious abortion.⁴⁹

ARMY SCHOOL OF NURSING *

The recommendation of the Surgeon General for the establishment of an Army school of nursing as the method of providing for the rapid expansion of skilled nursing service that the continuation of the war would inevitably demand was approved by the Secretary of War, May 25, 1918.⁵⁰

* Unless otherwise indicated, this report is based on "The History of the Army School of Nursing," by Annie W. Goodrich, Army School of Nursing. On file, Historical Division, S. G. O.

As a result of a conference in the Surgeon General's Office, the chairman of the Red Cross nursing service, the superintendent of the Army Nurse Corps, and the chief inspecting nurse were appointed a committee to prepare a plan for the suggested school. The committee, after consultation with the nurse members of the committee on nursing of the Council of National Defense, reported as follows:⁵¹

1. The committee appointed by your order has interpreted its purpose to be:

The creation of a plan whereby through an Army school of nursing the most complete nursing care may be provided for the sick and wounded soldiers at home and abroad, for the period of the war and for as long thereafter as the Government may decree. Also nurses for such other health fields as may be developed by the Medical Department.

The plan to provide for an easy, constant, and almost unlimited expansion of training fields and consequent increase in student and graduate nurses, in order that the arising demands of the service be fully met.

Through the provision of the student body to have in the process of training large groups becoming increasingly competent, thereby enabling the release of the most experienced nurses for the foreign and other demanding fields without lowering the efficiency of the base hospitals.

To immediately raise the standard of the nursing care of the sick in the base hospitals by the provisions of an increased number of persons to render such care.

2. The plan as presented provides that the school, to be known as the Army School of Nursing, shall be located in the Office of the Surgeon General. Through this office the enrollment of the students will take place, and all matters relating to the general management of the school shall be dealt with. The faculty, presided over by the dean of the school, is to determine all questions relating to the course of instruction, the general administration of the school being intrusted to the dean. It is suggested that an advisory council be appointed composed of members of the Medical Department, the superintendent of the Army and Navy Nurse Corps, the director of the department of nursing of the American Red Cross, the presidents of the American Nursing Association, the National League of Nursing Education, the National Organization for Public Health Nursing, the dean of the School of Nursing, and other members of the nursing profession conversant with the problems of nursing education to make recommendations concerning the appointment of the faculty, the relations between the military and civil hospitals, and other matters relating to the general policy of the schools.

The course of training will be given in the various base hospitals assigned as training camps, each one of which will be a complete unit, having its own director, its staff of lecturers, instructors, and supervisors, and its teaching equipment. These units will be developed as rapidly as the needs of the service demand. The directors and such members of the teaching staff as shall later be determined shall be members of the faculty.

The course leading to a diploma in nursing shall extend over a period of three years. The experience in the military hospital will provide surgical nursing, including orthopedic, eye and ear, and nose and throat; medical, including communicable diseases and nervous and mental diseases. Experience in children's diseases, obstetrics, and public health nursing will be provided through affiliation.

It is believed that the complete course will attract the most intelligent and largest number of women to the school and will result in a more efficient service both in the military hospitals and in such public health fields as the Medical Department may assign nurses to.

Upon completion of the course the students would become members of the Regular Army Nurse Corps in the order of the vacancies; or should there be no vacancies, they would be placed on the list for appointment as vacancies occur.

They would be eligible for State registration, for membership in the American Nurses' Association, the national organization for public health nursing, enrollment in the nursing service of the American Red Cross, and for advanced courses in the teaching, administrative, and public health fields.

A detailed outline of the plan is herewith presented, together with recommendations concerning the necessary circular and forms that will enable the immediate development of such a school if the authorization for its establishment is granted.

ORGANIZATION

The authorization of the establishment of the school brought into immediate existence a division in the Surgeon General's Office designated as the Army School of Nursing, and administered by the chief inspecting nurse, under the title of dean, who was directly responsible to the hospital division. The work fell into three bureaus: General information, credentials, and inspection, with a professional personnel of 9 and a maximum clerical staff of 30.

Bureau of general information.—This bureau was flooded with inquiries following a brief announcement of the school in the Official Bulletin, and an excellent and widely disseminated article in the press. Through the committee on nursing of the Council of National Defense, 25,000 announcements of this school were issued by a private printing company within a week, and the small printing department at Walter Reed Hospital put out 10,000 each of the various forms required by the applicant for admission within a few days, thereby making possible a rapid enrollment of students.

Bureau of credentials.—The requirement of four years' secondary work, or an educational equivalent, for admission to the school, and the giving of credits for advanced work, demanded careful and accurate evaluation of credentials.

Bureau of inspection.—This bureau was charged with the standardization of nursing care and equipment for the military hospitals where students were to be placed, the maintenance of the educational standards of the school, and the reports on civil hospitals and other institutions in connection with student affiliation.

Pending the decision as to the creation of a school, the inspection of the base hospitals was continued. At this time 20 inspections had been made, each one strengthening the opinion that the school would not only prove the most effectual supplement of the graduate nurse staff, but would be an important factor in raising the standard of nursing care.

One hundred and twenty-six inspections and visits were made in this country during the year, the signing of the armistice, with a consequent rapid decrease in the nursing service, obviating the necessity of the inspection of the military hospitals overseas, originally included in the functions of this bureau.

The advisory council.—In accordance with the plan of the school, the Surgeon General appointed an advisory council, on which sat five medical officers representing the Medical Department of the Army; representing the nursing profession were the chairman of the committee on nursing, the chairman of the Red Cross nursing service, the president of the American Nurses Association, the president of the National League of Nursing Education, the honorary president of the National Organization of Public Health Nursing, the superintendent of the Navy Nurse Corps, the superintendent of the Army Nurse Corps, the superintendent of the Presbyterian Hospital Training School, and the dean of the Army School of Nursing. Two meetings of the council were held during the year. At the second, in February, 1919, a resolution recommend-

ing the creation of a permanent school by Congress was passed and referred for approval to the Surgeon General, together with a tentative draft of a bill incorporating the essential requirements for the establishment of a school of high standards and on a sound basis.

Faculty.—The faculty comprised nurse directors and instructors, medical lecturers, and such other assistants as were required in the development of the school at the various military hospitals where students were placed.

Three conferences of the nurse members of the faculty were authorized by the Surgeon General, the last—of special value—being called in Chicago, in conjunction with the convention of the National League of Nursing Education, thereby making possible a discussion of nursing problems affecting both the civil and military schools, and strengthening the cooperation between the two.

The first literature concerning the school was issued on June 7, 1918; on June 17, 75 applications had been filed. Applications continued to come in in increasing numbers, the maximum received in one week being 1,249, and by November 11, the date of the signing of the armistice, 10,689 had been received, of which 5,267 had been accepted, 3,185 declined, and 2,219 were still under consideration; 1,099 students were on duty in 25 military hospitals, and 567 students were ready for assignment immediately upon the withdrawal, for overseas duty, of a sufficient number of graduate nurses to provide the necessary accommodations. For a brief period following the signing of the armistice, the acceptance and assignment of students continued, bringing the accepted applications up to 5,869 and the number of students on duty to 1,578, in 32 military hospitals, on December 21, 1918.

United States Student Nurses Reserve.—From the outset the Red Cross divisions rendered active assistance in recruiting students for the Army School of Nursing, but the heavy enrollment of graduate nurses that the continuation of the war would inevitably necessitate and the importance of a largely increased student body in both civil and military hospitals, in order that the release of the graduates be effected, without imperiling the sick in this country, made imperative a definite and extensive recruiting campaign. Such a campaign was undertaken by the women's committee of the Council of National Defense, cooperating with the Surgeon General of the United States Army, the American Red Cross, and the nursing committee of the council, under the title of the United States Student Nurses Reserve. The program provided for an intensive campaign, extending from July 29 to August 11, for the enrollment of 25,000 young women pledged to hold themselves in readiness until April 1, 1919, to enter either a civilian school of nursing or the Army school, if called, with the privilege of expressing a preference as to the school. Only students meeting the age and educational requirements, however, were placed on the waiting list of the Army school. As the full quota desired was not realized within the period of time allotted, the various State committees were authorized to continue the enrollment until the need ceased.

College preliminary course.—A further and not less important plan was developed by the American Council on Education, with the approval of the Surgeon General, whereby intensive preliminary courses of 12 weeks were to be established at higher educational institutions, the American Council on

Education undertaking to assist in recruiting students. The estimated quota was 2,000 students by October 1, 1918; 4,000 by January, 1919; and 5,000 by April, 1919. A number of colleges had signified their readiness to give these courses, while others had the matter under favorable consideration, when the cessation of hostilities led to its abandonment. This group would have been a valuable addition to the student body, relieving the Army school of the three months' preliminary course and making the student of immediate assistance in the hospital ward.

Civil school students.—As a means of further increasing the nursing personnel through a student body, and to steady the situation in the civil hospitals by giving their students a place in the war program, an opportunity was opened in August, 1918, to the schools of the 50 Red Cross base hospitals first sent overseas to send such a number of their senior students as could be spared, through affiliation with the Army School of Nursing, for immediate service overseas.

A course in the military hospitals of four months was also arranged for the senior and intermediate students of other civil schools, through which, if adjusted satisfactorily, they would be prepared for overseas service immediately upon graduation, or could be sent earlier, if necessary; it being desired that the students in the Army School of Nursing should have been in the service, if possible, a year before being sent overseas. Information and regulations relating to the course had been issued, and a number of civil schools had signified their desire to send students, when hostilities ceased.

Hospital assistants.—In order to conserve all available material it was also decided to enroll as hospital assistants women disqualified for overseas service by marriage or overage, and therefore not eligible for enrollment as students in the Army School of Nursing or in the civil schools. It was believed that this group, of whom approximately 1,000 had applied, would well supplement the graduate nurses in the convalescent hospitals in this country, leaving the acute service for the student body. To avoid complications and confusion relating to eligibility and placement and to insure an increasing competency of service through instruction and supervision, this group was entered as a division of the Army School of Nursing.

Red Cross aides.—The increasing shortage of nurses overseas, and the constant pressure for aides, due presumably to the failure of those in charge on the other side to understand both the potentialities of the school and that the shortage related to transportation rather than to an exhausted or inadequate graduate nurse supply, together with the anxiety caused by the influenza epidemic, led to the suggestion of the enrollment of practical nurses as less likely to affect the enrollment in the school, and to a countersuggestion calling for the enrollment of Red Cross aides:

I recommend against the enrollment of the practical and experienced nurses because they represent a class now more needed than ever in community life, because of the withdrawal of graduates * * *.

Rather than call upon the practical nurses so-called, I recommend:

1. Pushing the Army School of Nursing, which is the strongest part of our program.
2. Calling upon the civil hospitals to send affiliating pupils as many have indicated their desire to do.

3. Calling upon the civil hospitals to give preliminary training to hospital assistants, the group already authorized. This group to include married women between 21 and 40 whose husbands are overseas and single women between 35 and 45. This will establish the machinery for training a larger group should necessity arise. This course to cover six weeks or two months.

4. In order to meet the present emergency requirements, I recommend that the Red Cross select with care 1,500 of their nurses' aides who are between 35 and 45 years of age, and that these be sent at once overseas to supplement the nurses over there. This will meet the emergency and leave the field open here for the development of our program for the Army school and hospital assistants.

5. That an appeal be issued at once in the name of the Surgeon General to all young women of the country calling them to service, either through enrollment in the Army school or civil schools or as hospital assistants, according to the group in which they fall, and making plain to them that this is their greatest service, and also emphasizing that the pupils will be sent overseas as soon as ready and as needed.

Accordingly, the Surgeon General requested the American Red Cross nursing service to enroll 1,500 nurses' aides.

At the request of the Red Cross the age limit of the 1,500 aides was reduced to 30, it having been ascertained that only about 7 per cent of the accepted applicants for admission to the Army school exceeded that age. The signing of the armistice prevented the sending of these aides overseas.

The development of the training school units.—The rapid development of the school, obviously so necessary, and made possible by the immediate and heavy enrollment of students, was greatly delayed and hampered by the unfamiliarity of the chief nurses with the training school field, the large number of executives and instructors that had been sent overseas, and the consequent shortage of such personnel in the civil schools. A further difficulty came through failure to provide a graded service for the Nurse Corps, analogous to the grading of the commissioned personnel, and an almost universal system of control and direction in civil institutions; this omission made the positions of head nurse, supervisor, night superintendent, etc., undesirable, since they entailed increased responsibility without increased authority or salary; the omission to furnish the chief nurses with any data, other than the meager efficiency records, relating to the general education and the professional preparation of the graduate nurse personnel and the branches of nursing in which they had had experience was a still further handicap in the selection of an efficient supervising staff. The greatest obstacle in the school development was due, however, to the slow transportation of graduate nurses overseas and consequent inadequate housing capacity.

This delay was overcome in a measure by a circular letter, informing the commanding officers that in the future students would replace the graduates sent overseas, and ordering that quarters be found as soon as possible, as it was imperative that the course be begun and the efficiency of the students thereby hastened.

Chief nurses released for overseas duty were replaced by those who held executive positions in civilian schools, while the release was sought and obtained of several well-known nurse educators.

Thus an adequate number of executives were obtained, and, in the majority of cases, instructors of pedagogical as well as professional preparation were

secured. A notable contribution was the privilege of the four months' preliminary course at Teachers' College, Columbia University, New York City, for the training school unit at United States Army General Hospital No. 1, made possible by the authorities of the college through the omission of all tuition fees for these students.

COURSE OF STUDY

The timely issuance of the standard curriculum, prepared by the education committee of the National League for Nursing Education, made possible a uniform course of instruction. The necessary text and reference books and a classroom equipment, excelling that of most schools, were authorized, and despite the delays consequent upon a war situation were, in the main, promptly delivered.

The time allotted to the various subjects was divided between lectures and demonstrations by members of the medical staff or special lectures, and classes, quizzes, and laboratory work under qualified nurses and other instructors.

The subjects included in the preliminary course were: Anatomy and physiology; applied chemistry; bacteriology; personal hygiene; hospital house-keeping; nutrition and cookery; drugs and solutions; elementary nursing principles and methods; bandaging; historical, ethical, and social basis of nursing.

The subjects following the preliminary course included: *Materia medica* and therapeutics; diet in disease; massage; surgery; orthopedics; diseases of the eye, ear, nose, and throat; operating room technique; general medicine; communicable diseases; occupational, venereal, and skin diseases; nervous and mental diseases; diseases of infants and children; gynecology; obstetrics.

Public health nursing, social service, and other subjects relating to the problems of the several fields of nursing and modern social conditions will be taken up in the third year.

STUDENT NURSES

When the proposition for establishing an Army school of nursing and training students in our camp hospitals was first launched, a general impression prevailed that this would be a dangerous undertaking from the social standpoint. A large number of young and recent graduates had been obliged to face the unusual conditions of camp life with perhaps less preparation for meeting such conditions than many of the students enrolled in the Army school who had previously been thrown on their own resources, or who had passed through college, or had been in the teaching field. Therefore, it was felt that with proper guidance from the directors, instructors, and social directors of the units, the students would not be at any less disadvantage than those in our civil schools. The students were quick to adopt a plan of self-government under the advice of their director and instructor and assumed the responsibility in maintaining the good standing of their individual groups. It was interesting to see how this worked out in the various units and the problem of their social life brought under their own control. (See *infra*, p. 452.) The social activities showed a variety of features. In some, music was dominant, in others the drama; glee clubs were organized, playlets written and carried out; in some groups drill and outdoor sports were emphasized. Students in all of the units were drilled

every day, or at least three times a week, out of doors when the weather was good; if not, indoors with open windows in the form of setting-up exercises. In an interesting group of 100 in one of our northern camps, students were outfitted from the Quartermaster Department with leggings, coat, and over-seas cap for outdoor drill and hikes.

These wholesome forms of exercise and recreation created a splendid unit and took care of the leisure time after study and ward duty; when brought under the control of the student body itself it promoted a strong class spirit and unity. The Red Cross recreation house, designed for the uses of the nurses of the Army Nurse Corps, was, as a rule, given over to the students on one or two evenings of the week that they might receive their visitors, have dances, or other form of entertainment as they arranged for.

UNIFORM

A military uniform and insignia were authorized by The Adjutant General, the latter being a bronze lamp, superimposed on the Caduceus, a tribute to the founder of nurse training schools, Florence Nightingale.

STATE REGULATIONS OF THE SCHOOLS

The educational requirement for admission and the period of professional education entitled the graduates of the school to nurse registration, except that students to whom credit for collegiate or technical work was given were not eligible in States requiring a full three years' course in a hospital.

CONTINUATION OF THE COURSE

The close of the fiscal year (June 30, 1919) presented 741 students remaining to complete the course, leading to the diploma of the school, 573 on duty in 15 military hospitals, and 168 absent in the affiliating schools. The percentage of withdrawals was not high considering the large number of students previously engaged in the occupational fields.

AFFILIATION WITH CIVIL SCHOOLS OF NURSING

The response of the civil hospitals to the request for experience in the services not obtainable in the military hospitals was generous both as to opportunity and in the adjustment required to meet the needs of the Army school; affiliation being effected with the leading hospitals able to give the required experience in New York, Baltimore, Philadelphia, St. Louis, Washington, Chicago, Boston, Minneapolis, Cincinnati, Newton, Mass., and San Francisco.

The credit allowed for advanced work reducing the term in the school and the admittance of the entire body of students within a period of six months necessitated, in order that the full experience be obtained by each student seeking a diploma, an earlier admission to the affiliating courses than is customary for the special hospitals (maternity especially) to permit. These requirements were relaxed, but the adjustment of the students to the work was satisfactory and is evidence of the value the student body would have been for overseas duty had the war continued.

ARMY SCHOOL OF NURSING, UNITED STATES ARMY BASE HOSPITAL, CAMP GRANT, ILL.

The report of the Army School of Nursing conducted at the base hospital, Camp Grant,⁵² is given in full as an illustration of the conduct of an Army school:

STUDENT NURSE BATTALION, ARMY SCHOOL OF NURSING

In the spring of 1918, it was apparent that there would be an acute shortage of graduate nurses in the Army. The civilian communities had been combed of available qualified graduate nurses and still there was an urgent call for graduate nurses from overseas.

The division surgeon, 86th Division, Camp Grant, and the commanding officer, base hospital, Camp Grant, Ill., made a recommendation to the Surgeon General of the Army, under date of June 8, 1918, that this hospital be permitted to conduct a school for practical nurses in order that graduate nurses be released for overseas duty. In reply to this communication, the Surgeon General stated that his office had under consideration a proposed plan for conducting training schools for nurses in the Army that would require three years for graduation. This plan was superior to the one offered from Camp Grant in that the nurse would be a graduate and thoroughly qualified to carry on this profession as her life's work. This same communication stated that if the Army School of Nursing was organized, Camp Grant would be one of the camps selected.

The first group of students arrived August 14, 1918. They were typical "rookies," dressed in every conceivable costume and very much excited over their new environment. They expected and were willing to live in barracks and undergo many of the hardships that are ordinarily experienced in field service. Attractive quarters had been built and furnished for the students. The faculty was organized for their training, both from a professional and military standpoint, and the students were assigned to duty the following day.

The problem of discipline was one that we had given considerable thought, and it seemed advisable to give the new rookies some of the military training that is customary for all recruits; therefore, drill was promptly started and the girls were given the same foot drill as is given enlisted men of the Medical Department. They were intelligent and grasped the idea rapidly. However, there were two features that were difficult to overcome and are not ordinarily encountered in drilling enlisted men. One was looking around and laughing, while the other was an uncontrollable desire to be continually fixing their hair. This group was called Company A and was turned out daily for retreat.

The second group of students arrived September 18, 1918. There were 36 in number. This group was organized as Company B and given the same instructions as Company A. They were much easier to train, as Company A assisted very materially in the training. Authority was obtained to issue olive-drab overcoats. This was promptly done and has served a good purpose. Not only has it been a material saving to the students, but adds much to the military appearance. Company B arrived but a short time before the "flu" epidemic. In fact, they were here but a few days before it was necessary to put them into the wards, and the undersigned desires to go on record as saying that the students of both Company A and Company B were of the greatest value during that emergency.

The third group of students arrived November 20, 1918, and were organized as Company C. Students were selected from the three groups as commissioned and noncommissioned officers. A captain, first lieutenant, second lieutenant, first sergeant, and necessary sergeants and corporals were properly uniformed and assigned to each company. The students were given squad, company, battalion, and athletic drill and were outfitted in a woolen uniform, with puttees and overseas cap, on account of the severe winters in this climate. Daily drill and retreat was kept up until the early spring. The students were greatly benefited by the drill, as was noticed in the manner in which they would receive and obey orders, and the military manner in which they would carry themselves. It is an inspiring sight to see the manner in which they honor the flag at all ceremonies.

THE WORK OF THE STUDENT NURSES DURING THE EPIDEMIC

Sunday, September 22, 1918, the first cases of Spanish influenza were brought into the base hospital and on the afternoon of that day the students met in the sewing room and there inspected and remade hundreds of gauze masks to make them comply with requirements. When this work was completed the girls of the second group went to the demonstration room in the school building and there were given a demonstration lesson in bed making.

Monday morning the girls of the second class, or, as they are called, the second group, were called out to make beds and help put barracks in readiness for the receiving of sick soldiers.

These barracks had been used as quarters for men of the Medical Corps and had to be cleaned and filled with supplies suitable for the maintenance of a ward. Groups of men were detailed who swept and scrubbed the floors, cleaned windows, unpacked beds and chairs, carried them into the wards, and did such other work as was required of them. The student nurses scrubbed and made up the beds, helping arrange them in regular rows, cleaned and arranged linen closets, cleaned the kitchens, washed dishes and silverware; in fact, doing the necessary work called for to make the buildings ready for the use of the sick boys.

This work of opening up barracks continued for a week, during which time 18 or 20 soldiers' barracks, each having an average capacity of almost 100 men, were opened for ward purposes and beds made up in the corridors of the base hospital. Many of the beds made were equipped with straw ticks and the making of such beds was an entirely new effort on the part of many of the girls. After the beds were made and arranged as they should be, sputum cups, folded napkins, paper bags for refuse, towels, a bathrobe, slippers, and a pajama suit were placed on each bed.

Influenza made its entrance into the ranks of the nurses during the first week and, being no respecter of classes, attacked many of the graduate nurses as well as the girls of the training school. The infirmary was soon taxed to its capacity; and, as there was no place fixed for the sick nurses, many were left in their rooms and placed under the care of the nurses of the infirmary. Finally the number of ill nurses in the quarters increased to such a number that it was impossible for one nurse to care for them, in addition to her patients in the infirmary, so students of the training school were appointed to look after the sick nurses in the quarters. These were required to take care of the diets of nurses who were ill, take pulse and temperature, and daily give a report of each sick nurse to the graduate nurse who had charge of the infirmary; they were allowed, also, to give aspirin tablets and magnesium sulphate under the direction of the graduate nurse.

The number of nurses suffering from influenza increased so rapidly that a second infirmary was opened in the school building and nurses who were confined to their quarters were moved to this place. Here student nurses were given some practical ward work.

The number of patients in the wards increased so rapidly and the nurses and corps men were so rushed with work that it became necessary to organize cleaning squads, or, as they

were called, "broom squads," to aid in the cleaning of wards. There were eight of these squads, each composed of 8 men who worked 8 hours daily under the supervision of a student nurse. These broom squads were each assigned to certain groups of wards, and it was their duty to see that the wards were cleaned of all refuse each morning and everything was in good order.

During the second week of the epidemic some of the students were put on ward work and there received their first lessons in practical nursing; and though this work was difficult for an inexperienced girl, each one did her part cheerfully, grateful for the opportunity of contributing her mite toward checking the epidemic.

STUDENT GOVERNMENT

On Saturday, August 17, 1918, Miss Anne Williamson, director of the Army School of Nursing, Camp Grant, in her opening talk to the student nurses, recommended that a student form of government be adopted as the basis for the regulation of all students activities.

Acting upon this recommendation, the students were called together. At this meeting, three officers were elected—president, Miss Lyda S. Houston; vice president, Miss Lois West; secretary and treasurer, Miss Catherine Carton. These three officers, together with two members of the faculty, were appointed a committee to draw up a set of rules to be presented to the class for approval.

These rules provided for the future election of all officers, for the calling of student meetings, and for the governing of the student nurses both in the quarters and on the ground and in all social activities. The rough draft was presented by the committee to the student body for approval and adoption. Each rule was individually read and discussed before adoption. Some changes were made. The rules were next presented for approval, as supplementary to the Rules for Nurses as already issued by Colonel Michie to Miss Williamson, director, and to Colonel Michie, commander of the base hospital unit.

This form of government has proven to be of great benefit not only in the direction of all student activities, but as an organized means through which the faculty members and all officers can reach the student body. Student action has been much more effective and immediate than would have been possible in an unorganized state.

Several permanent committees, such as social, musical, dramatic, and athletic, have been appointed and have been the means of furnishing entertainment by the school.

This form of government and the rules approved and adopted govern not only the class which entered August 15, but also all student nurses sent for training to Camp Grant.

STUDENT QUARTERS AND ARMY TRAINING SCHOOL BUILDING

The student nurses' quarters at Camp Grant, base hospital, are located at the edge of the hospital grounds, a branch of the Rock River Valley cutting directly behind them. The quarters include three long narrow one-story frame buildings, well elevated from the ground, and connected by a roofed and railed wooden walk, which serves also as front veranda for all three. The back verandas, overlooking the gulch and with an interesting view of the river and rolling country to the westward, have not intermediary connection.

The general plan of the quarters' interiors, centers around the long hallway running directly through the building from the small front reception room to the rear veranda. Opening onto this hall from both sides are the 26 bedrooms, large lavatory, laundry and ironing rooms, and linen closet. The electric light and steam heat employed are from the camp power and heating plants. Fire protection is provided for in the regular fire buckets such as are used in wards and barracks, and by chemical extinguishers placed in the corridor. Ventilation is provided through a system of traps through the ceilings and transoms over each door.

The front reception room is furnished in dark willow and cretonne, with comfortable cushioned easy chairs. This reception room is also, in a way, the office of the quarters, matters of general interest to the quarters being adjusted there, bulletins and notices posted, and guests received.

The laundry and lavatory are fully equipped with all conveniences and supplied with abundant hot water at all hours. The ironing room is fitted with a board, and socket for the attachment of electric irons.

The most interesting part of the quarters is, of course, the bedrooms, one of which each student nurse has entirely to herself. The original furnishings included a white iron hospital bed, a dark wooden chair and bureau, with a large mirror, a built-in wardrobe, cupboard with upper shelf, closed wall writing desk, with shelves and compartments, and a little enamel rocker. The large window is fitted with marquissette sash curtains and the pine floor is partially covered by a simple dark rug. The woodwork is of unfinished pine, the walls of a soft tone of eeu wall board. All conducive to a general tone of quiet, refreshing simplicity. The student nurses take such pride in their little "homes" that they have completed the decoration with wardrobe curtains, dresser scarfs, and window drapes of cretonne or similar materials, with perhaps a simple print, or motto, and a few books on the writing desk, giving each room the individual touch so much to be desired. The students on entering had rather expected to be quartered in common barracks, with long rows of low bunks and crowded lockers for clothing. So their delight in being given individual rooms, so completely equipped with such thought to their comfort and convenience, can hardly be overestimated.

The school building stands just around the corner from the quarters. It is a large two-story building, with screened veranda running the full length of the building, upstairs and down. Downstairs are the recreation and dietetics rooms, with adjoining lavatories and offices; upstairs the lecture room and demonstration room. The ventilation, light, and heating system is similar to that of the quarters.

The recreation room is a point of pride to every student nurse, since its furnishing is largely the result of their own efforts. It is furnished in a quiet tone of blue-gray, as are the other rooms of the school, with window drapes and lamp shades of rose. Cretonne-covered divans, easy chairs, writing tables, with a supply of magazines, a victrola, and a piano complete the general equipment, though such brief enumeration must fail to carry the impression of each relaxed comfort which prevades the room.

The dietetics room across the hall is fitted with the long laboratory table with individual cupboards and drawers containing necessary utensils and supplies, as well as writing tables and chairs for note taking. Heat is provided through an electric range and a number of small electric heaters. Other supplies and articles not in constant use are kept in the small supply room adjoining, or, as soaps and dishpans, in the lavatory reserved for kitchen uses.

The Medical Department has been very generous in providing necessities for a thorough dietetics course.

Individual equipment

1 spatula.	2 bread tins (large and small).
1 paring knife.	1 custard cup.
2 tablespoons.	1 small teapot.
2 teaspoons.	3 white enamel bowls (1 large, 2 small).
1 knife.	1 white enamel utility plate.
1 fork.	1 small pie tin.
1 apple corer.	Food containers (salt, pepper, flour, sugar).
2 asbestos mats.	2 enamel saucepans (large and small).
2 measuring cups (glass and tin).	1 double boiler.
1 biscuit cutter.	1 small frying pan.
1 vegetable brush.	1 skimmer.
2 knives (large and small).	1 grater.
1 Dover egg beater.	1 electric plate.
1 egg whip.	1 gram scales (for two students).
2 tin covers (large and small).	

General equipment

1 ice box.	Potato urns.
2 electric stoves.	Lemon squeezers.
2 blackboards.	Chopping bowls.
2 stock pots.	Rolling pins.
3 large double boilers.	Butcher knives.
2 large enamel saucepans.	Glass tumblers.
Coffee pots.	Glass sugar and creamers.
Enamel pitchers.	Glass sherbert dishes.
Muffin tins.	China dishes.
Cake tins.	Silver.
Baking sheets.	Towels, etc.
Bread coolers.	

Upstairs the hallway is furnished with study tables and chairs for use in getting reference work. And one small office is fitted with shelves and set apart as a student's reference library.

The lecture room is provided with armchairs for note taking, blackboard and lecturer's desk, specimen cabinet, and a number of anatomical charts. For use in anatomical study an excellent skeleton has been provided, which when not in actual use is kept in gruesome seclusion in a corner of the library.

In the demonstration room across the hall used especially for the practical nursing course are four beds, with tables and a wheel chair. Linen and all other supplies necessary to nursing demonstration are kept in an adjoining linen closet. Most of all important in the equipment of this class room is Lucy, the demonstration doll. Jointed, washable, and never querulous, she makes an ideal patient.

Neither in quarters nor in school has anything conducive to the student's comfort and convenience, or essential to their professional training, been overlooked.

ROUTINE LIFE OF A STUDENT NURSE AT CAMP GRANT, ILL.

The life of an Army nurse, although supposedly arranged according to a regular routine, is nevertheless subject to the most unexpected and varied experiences.

We arise at 5.45, and at 6.25 must be ready to answer breakfast mess call, with our quarters in perfect order and ourselves in uniform, to go directly from the mess hall to the wards for our morning hours of duty.

The abundance and quality of the food and healthy appetites of the girls compensate for lack of niceties in service, and soon even the most fastidious only complain because meals are not closer together.

The daily hours between 7 a. m. and 7 p. m. are divided between ward work, classes and lectures, and drill. We average five hours a day ward work and one hour military drill. On the ward we make beds, give baths, rub backs, prepare diets, take temperatures under supervision of the head nurse, and with the help of corps men assist in the general tidiness of the wards.

No matter how tired we may be from ward or class work, an hour of military drill or a hike, in our Regular Army drill suits and with our own student officers, renews vigor and enthusiasms.

At 4.45 every night, except Saturday and Sunday, the hospital force stand retreat. Headed by the base hospital band, the medical officers, graduate nurses, student nurses, and enlisted men march up Hospital Street and, forming one long line, pay tribute to the flags of America and of the Red Cross, and they are lowered for the day. Differing from retreat in other parts of the camp, here the column of khaki is interrupted by a line of graduate nurses all in white, with Red Cross capes, and student nurses in blue uniforms, white collars and cuffs, and khaki sweaters.

Supper at 5.30 p. m., and one hour of ward duty in making the patients comfortable for the night, and our day is supposedly over at 7 p. m., with the evening free for study. Quiet hour is enforced by the quarters' proctor from 8.15 p. m., and all lights out at 10.30 p. m.

But how monotonous would our life be if such were the regular routine of each day. Between times we wash and iron our collars, cuffs, and caps, do the innumerable things a girl finds necessary to keep wardrobe and quarters respectable, her family and friends in good humor, and herself posted on camp rumors.

But most disastrous to the daily routine are the impromptu orders liable to be issued at any instant. Such orders supersede all others and may allow from 3 to 10 minutes for their execution. Among those most common are: A call to attend a special lecture, exhibits, demonstration, or picture show, a call to appear in full drill uniform for inspection, in nurses' uniform for pictures, or a general review for some visiting officer of Army or Nurse Corps.

All quarters and wards are inspected every Saturday at 9 a. m., and as often between times as any visiting official or commander so desires.

On Saturday afternoon we are free from all hospital and military duties, and on Sunday have only seven hours ward duty.

For delicacies not furnished at the mess hall and for necessities of everyday life, we may go to the regimental canteen in the base hospital proper, or to "The Hub," a little group of stores just across the reservation line and only a short distance from our quarters. Other places serving the student nurses are the Young Men's Christian Association, Knights of Columbus, and Red Cross buildings, and our own recreation and school building and the Liberty Theater over in the camp proper.

For a touch of civilian life we can go to Rockford on Saturday afternoons, with a real dinner in town and a picture show afterwards, but must be home again by 10.30 p. m.

ARMY SCHOOL OF NURSING, UNITED STATES ARMY BASE HOSPITAL, CAMP GRANT, ILL.— THE COURSE OF STUDY

The plan for the course of study for the Army training school is practically the same as that outlined by the standard curriculum for schools of nursing, published in May, 1919.

During the three years' course of training the time to be allotted the various services is approximately as follows:

	Months
Preliminary training.....	4
Medical nursing.....	7
Surgical nursing (4 months operating room, 4 months wards).....	8
Vacation.....	2
Contagious diseases.....	3
Mental nursing.....	3
Affiliation:	
Obstetrics.....	4
Public health.....	3
Pediatrics.....	3
Gynecology.....	1
Vacation.....	1
Total.....	36

The instruction given during the preliminary period of four months included the following subjects:

	Hours
Anatomy and physiology.....	70
Bacteriology.....	20
Hygiene.....	12
Chemistry.....	36
Dietetics.....	40
Nursing principles and methods.....	60
Anesthesia.....	4
History of nursing.....	10
Bandaging.....	12
Total.....	264
Military drill.....	120

In addition all students admitted in the first group completed and received credit in the gas defense course.

During the preliminary period class instruction was given to the various groups individually. For the first year's work it was possible to combine all students for the lectures given; all quiz and laboratory work was given by dividing the students into comparatively small groups.

The instruction during the remaining portion of the first year included the following subjects:

	Hours
Diet in disease.....	10
Pharmacy, dosage and solutions, materia medica.....	40
Massage.....	12
Elementary pathology.....	8
Medical nursing.....	20
Surgical nursing.....	20
Laboratory technique.....	14
Total.....	124

Thus by June 1, 1919, the first year's work was completed by all students, and classes were discontinued for the summer months. This made it possible to place all students on 8-hour ward duty.

Affiliations became effective May 1, 1919, when a group of 7 students was sent to Chicago Lying-in Hospital for training in obstetrics. June 1, 1919, 7 additional students were sent to the same place, 10 to the Children's Memorial for training in pediatrics, and 6 to the Rockford City Hospital for training in gynecology.

The entire student group was transferred from Camp Grant to Fort Sheridan June 21, 1919. Records show that on that date 67 per cent of the entire group of students entered at Camp Grant were still in training.

Statistics obtained from 97 of 112 student nurses originally assigned to United States Army base hospital, Camp Grant, Ill., relative to the composition of the student group.

Average age, 23.9

Occupation.—Teaching—all positions from that of teacher in district school to principal of high school: Seventy per cent were teachers or had taught (64 in number; 1 of 12 years' experience). Stenography, typewriting, and bookkeeping; clerical positions; commercial art; newspaper reporters; librarians; telephone operators; laboratory technicians; dietitians; social charity workers; probation officers; social settlement workers; playground workers; deputy treasurers; homekeepers (8 in number). Wage earners, 82 per cent; average wage, \$67; total monthly wage, \$5,114.

Monthly wage:	Number of earners
\$30 to \$50.....	11
\$50 to \$75.....	44
\$75 to \$100.....	14
\$100 to \$130.....	5
\$150.....	1

RECREATION

All work and no play makes Jill a dull girl. The truth of this was recognized in the organization of the Camp Grant branch of the Army School of Nursing, as was evidenced by the diverse fields of activity offered, with a view not only to reach every member but to present a pleasing variety as well. The arrival of the first class found definite provisions for this important phase of student life, and many developments have since resulted as the need and opportunity arose.

In the school building assigned to us, one large room was reserved to be used as a recreation room. This room was furnished with the view of meeting as many needs as possible. A charming color scheme of gray walls, rose window hangings and shaded lights, and couches upholstered in attractive cretonnes delights the eyes of all; desks with writing materials are

provided; and dear to the hearts of all the students are the phonograph and the piano. These furnish the music for many an impromptu dance and many are the songs sung there. This room has been the scene of several successful parties given by the various classes.

Besides dancing at the recreation room, the Red Cross building is thrown open to us every Friday evening. The early part of the evening is devoted to the instruction of those who wish to learn to dance; later in the evening all of the student nurses are invited to join in the evening's pleasure.

Music has been one of our most delightful forms of recreation. We are exceedingly fortunate in having a base-hospital band of unusual excellence. Band concerts are always attended and appreciated by the "blue nurses." On September 20, 1918, the first class of the training school gave a concert to raise money to help pay for our piano. With the aid of Sergeant Vorkeller and Private Hasse, of the base-hospital band, and supported by the orchestra, a very creditable performance was produced. The program consisted of several numbers by the band, choruses by the glee club, and solos.

Athletics have claimed the attention of most of the student body whenever the weather permits, and tennis, baseball played according to indoor rules, and hikes have received their full share of attention. Excellent tennis courts are close at hand, and stated times at which they are reserved for the use of the student nurses are prescribed. Not far from quarters is a level piece of ground, which makes an ideal baseball diamond, while the bank of the Rock River is one of the many paths which offer an irresistible temptation to obtain the necessary out-of-door exercise. When the weather no longer made it possible to indulge in these pleasures, equally interesting substitutes were provided in the form of basket ball, captain ball, and other indoor sports.

MILITARY DRILL

On August 19, 1918, under the command of Lieutenant Colonel Michie, commanding officer of the base hospital, the student nurses of the Camp Grant training school received their first instruction in military drill. A month later, upon the arrival of the second group of students, the student body was organized into two individual companies, each company electing its officers from its own group. Each company was divided into two platoons, each platoon under the command of a lieutenant. Upon arrival of new groups of students the same plan of organization was continued. On March 1, 1919, the following battalion staff was in command:

OFFICERS, FIRST BATTALION ARMY SCHOOL OF NURSING, ARMY NURSE CORPS, UNITED STATES
ARMY BASE HOSPITAL, CAMP GRANT, ILL.

Battalion staff:

Adjutant, First Lieut. Irene D. E. Hoyer, A. S. N.

Supply officer, First Lieut. Mary Ellen Gipson, A. S. N.

Supply sergeant, Battalion Supply Sergt. Mabel Hendrickson, A. S. N.

	Company A	Company B	Company C
Captain.....	Edith A. Spear.....	Doris Healey.....	Florence A. Marvyne.
First lieutenant.....	Mary Ellen Gipson.....	Irene D. Hoyer.....	Eugenie Williston.
Second lieutenant.....	Zola G. Slaughter.....	Eleanor Kennedy.....	Gladys L. Warrick.
			Mabel Hendrickson.
Staff noncommissioned officers:			
First sergeant.....	Mava M. Edwards.....	Lucile Baker.....	Louise Hast.
Sergeant.....	Ester F. Tyler.....	Ariel B. Anderson.....	Olga G. Olson.
	Synneve Y. Eikum.....	Helena Stevens.....	Edith M. Frohmader.
Corporal.....	Margaret Rundlett.....	Alice M. Broadbent.....	Laura L. Baker.
	Catherine P. Carton.....	Rhea Hunt.....	Pearl A. Ely.
	Lois G. Bishop.....	Mildred Burns.....	Ada E. Smith.
		Mary C. Sheer.....	

This list supercedes all previous lists.

By order of Captain Bauer:

IRENE D. E. HOYER,
First Lieutenant, A. S. N., Army Nurse Corps,
Battalion Adjutant.

Special insignia of rank for battalion officers was prescribed as an integral part of the uniform, to be worn at all times. The insignia of rank in the various grades was designated as follows:

(a) *Captains*.—(1) Three gold buttons, S. A. T. C. These buttons are to be worn on the left side of the front of the overseas cap, the center of each button to be placed according to the following dimensions: First button, $1\frac{3}{4}$ inches from center of cap and $1\frac{1}{4}$ inches above the lower margin of cap; second button, $1\frac{1}{4}$ inches to the left of the first button and $1\frac{1}{2}$ inches above the lower margin of the cap; the third button, $1\frac{1}{4}$ inches to the left of the second button and $1\frac{3}{4}$ inches from the lower margin of the cap. On each epaulet of the outdoor uniform, the first button to be one-half inch from the sleeve seam; other buttons to be spaced one-half inch from each other in the direction of the collar. On the right side of the collar of the olive-drab shirt, the first button one-half inch from front edge of the collar; additional buttons at 1-inch intervals from each other.

(2) Three chevrons (of the design in the possession of the battalion adjutant) on the forearm of both sleeves of the overcoat, apex of each chevron surmounted by a button. Material of these chevrons to be one-quarter inch flat luster black mohair braid; buttons three-eighths inch diameter, flat, cloth-covered, black.

(b) *First lieutenants*.—(1) Two gold buttons; two sleeve chevrons corresponding to the first button and chevron of the above-described captains' insignia.

(c) *Second lieutenants*.—(1) One gold button and one sleeve chevron corresponding to the first button and chevron of the above-described captains' insignia.

(d) *Noncommissioned officers*.—(1) Chevrons of the pattern prescribed for the corresponding grades of other branches of the United States Army, but distinctive for the Army School of Nursing, Camp Grant, Ill., in colors as follows: For the outdoor uniform, gold bars on navy blue, to be worn on both sleeves, midway between the elbow and the shoulder. For the olive-drab uniform, blue bars on olive drab, to be worn on the right sleeve only, midway between the elbow and the shoulder of both the overcoat and the olive-drab shirt. For the overseas cap, miniature metal chevrons, to be worn 1 inch to the left of the front seam of the cap and 1 inch from the lower margin of the cap.

Battalion inspection was held weekly by Colonel Michie, taking into consideration the following points:

	Battalion Staff	Company A	Company B	Company C
Discipline				
Appearance of uniform				
Drill				
Attendance				
Authorized absence				
General impression				
Remarks				
Total rating				
Order of companies				

All ratings were made on a percentage basis, and the companies formed in the following order in the battalion for the week following the posting of the report of the inspection.

With the color			Without the color	
Leading company ..	Color (center) ..		Leading (right) ..	
Second company ..	Leading (right) ..		Second (center) ..	
Third company ..	Rear (left) ..		Rear (left) ..	

When the ratings are equal, the order of companies from front to rear in column or right to left in line, will be A, B, and C.

The following schedule of military drill was prescribed by memorandum issued January 18, 1919.

	Monday	Tuesday	Wednesday	Thursday	Friday	Officer
Signal drill	A		B		C	Capt. A. J. Dahlstream, Q. M. C. Company commander. Capt. W. W. Bauer, M. C. Lieut. Col. H. C. Michie (Friday); Captain Bauer (Tuesday).
Signal or ordinary drill	B		C		A	
Drill instruction	C		A		B	
Battalion drill		A, B, C			A, B, C	

In addition to the sweater and helmet issued by the Red Cross, each student was supplied with a complete olive-drab outfit, consisting of olive-drab breeches, shirt, overcoat, spiral leggings, belt, and overseas cap, for drill during the winter months.

Military drill was discontinued in May, about 120 hours having been devoted to this course.

All members of the student battalion desire to express to Colonel Michie and his assistants their appreciation of the privilege of such excellent military drill and instruction as was given them.

ARMY LABORATORY SCHOOL, YALE UNIVERSITY, NEW HAVEN, CONN.^a

The Army Laboratory School at Yale University was the direct offspring, or, more correctly, the metamorphosis of the laboratory school, Fort Leavenworth. It was recognized by the Surgeon General early in the war that it would be necessary to supply, both at home and overseas, officers and men who were trained in laboratory methods developed by the Medical Department of the United States Army. A school for this purpose was established early in 1918, at the department laboratory of the Central Department, Fort Leavenworth, Kans. It became necessary, as the school increased in size, to occupy two large Infantry barracks and two sets of officers' quarters for the work of the school. These buildings were equipped with work benches, running water, and other material necessary for the school by the Quartermaster Corps of the post without cost to the Medical Department.

It was possible at Fort Leavenworth to train only a limited number of officers and men, but with the facilities available the school was able to place in the field 13 mobile laboratories, the personnel of each consisting of 1 officer of the Medical Corps, 1 officer of the Sanitary Corps, and 1 sergeant and 3 privates of the Medical Department. In addition to these mobile laboratories, 1 stationary laboratory was formed, the personnel of which consisted of 2 officers of the Medical Corps, 4 officers of the Sanitary Corps, and 12 enlisted men of the Medical Department. In addition to these units, a considerable number of officers and men were trained in the school and assigned to the laboratories and camps of this country.

It soon became evident that the supply of well-trained laboratory men would soon be exhausted and that it would be necessary to train men in the elements of bacteriology and chemistry. This fact, together with the constant increase of officers and men, rendered it necessary to secure larger quarters for the work. As no other buildings could be obtained at Fort Leavenworth, a medical officer was ordered to inspect the Medical Officers' Training Camp at Camp Greenleaf, Fort Oglethorpe, Ga., in the latter part of May, 1918, it being understood that money was available for erecting suitable buildings at

^a The history of this school is based on: "Report of the work of the Yale Army Laboratory School for the fiscal year ending June 30, 1919, by Col. Charles F. Craig, M. C., United States Army. On file, Historical Division, Surgeon General's Office.

this post for the purposes of the school. As a result of this inspection, it was found that buildings could not be erected at that place, no funds being immediately available, and that Camp Greenleaf could offer no better accommodations than did Fort Leavenworth. The commandant advised that the school should not be moved unless laboratory buildings could be promptly erected. An offer from the authorities of Yale University to furnish buildings to the Government for training purposes⁵³ was then investigated. It was found that Yale University was willing to provide classrooms and laboratories for the Laboratory School in the Brady Laboratory, another building known as the surgical laboratory, and in Kent Hall. These buildings were offered free of charge to the Medical Department and were capable of providing classrooms for from 50 to 100 officers and from 50 to 75 enlisted men. Dormitory space was offered by the university for both officers and enlisted men, the rental of the quarters for the enlisted men being placed at the sum provided for commutation of quarters by the Government. The university required that the Government furnish all apparatus except large apparatus such as incubators, etc., and all chemicals and other material used in the teaching of officers and men. The offer of the university would enable the school to handle about 300 officers and enlisted men without crowding in the classrooms, and clinical facilities were given by the New Haven State Hospital, which was immediately adjacent to the Brady Laboratory. In view of the facilities offered, it was recommended that the Laboratory School be moved to the Yale University as soon as possible, and on July 9, 1918, a laboratory school was ordered established at Yale University. Despite the fact that alterations were necessary in the buildings in order to accommodate so large a number of students, the school opened on August 1, 1918, the officers and enlisted men on duty at Fort Leavenworth having been transferred in the meantime. A large part of the equipment was brought from the department laboratory at Fort Leavenworth on the laboratory car "Reed," and requisitions were placed for other equipment, which arrived promptly, no time being lost because of lack of equipment.

It was soon found that the classrooms available would be inadequate for the officers and enlisted men, who were constantly increasing in number. This matter was brought before the president of the university and the Yale Corporation, who voted to erect a temporary building, without cost to the Government, adjacent to the Brady Laboratory. This building, which was completed in 18 days, consisted of two large rooms, one room capable of holding 100 officers and the other capable of holding 200 enlisted men at one time. This building cost the university approximately \$40,000. It was equipped with electricity and steam heat and furnished ideal laboratory classrooms for the school.

From August 1, 1918, until teaching at this school was discontinued January 1, 1919, a total of 1,016 officers and enlisted men served at this station. Of this number 460 were officers, of which 223 were officers of the Medical Corps and 237 were officers of the Sanitary Corps.

The signing of the armistice on November 11, 1918, brought to a conclusion the work of the school so far as the organization of laboratory units was concerned. The officers and enlisted men who were left at the school were gradually distributed to Army laboratories in this country, except those who were

discharged on their own application or for other reasons. Prior to this date there were organized at the school, from officers and men who had finished their course of instruction, 10 mobile laboratories, consisting of a total of 20 officers and 40 enlisted men, and 3 stationary laboratories, consisting of a total of 18 officers and 36 enlisted men. These units were organized for service with our armies in France, and practically all of the mobile laboratories had been ordered to the port of embarkation before the armistice was signed.

In addition to these units, the Yale Army Laboratory School supplied laboratory officers and men for base hospitals, evacuation hospitals, and mobile hospitals intended for service in France. In all 33 medical officers and 18 officers of the Sanitary Corps were assigned to duty with base hospitals, 12 medical officers and 2 officers of the Sanitary Corps to duty with evacuation hospitals, and 4 medical officers to mobile hospitals. In addition to the officers assigned to these hospitals, a total of 239 enlisted technicians who received their training at this school were assigned to these hospitals.

During August, 1918, an understanding was reached with the Rockefeller Institute whereby the Yale Army Laboratory School was to furnish every six weeks a class of 40 officers for advanced training in bacteriology and chemistry. This class was to substitute a similar class in advanced work which was instituted at the Yale Army Laboratory School. This measure was necessary in order to keep the Army supplied with officers properly trained in bacteriology and chemistry, as applied to the prevention of disease and its diagnosis in the field. Owing to the outbreak of the severe epidemic of influenza in September, 1918, it was impossible for this measure to be carried out, so that only one class of 32 officers was sent from the Yale Army Laboratory School to the Rockefeller Institute. Before the time had arrived for the sending of another class the armistice had been signed.

The influenza epidemic, which continued until December, interfered seriously with the work of the school as, owing to the shortage of medical officers, it was necessary to order 56 officers of the Medical Corps who were pursuing studies at the school to various camps for temporary duty. This, of course, interfered with the sending of units abroad and the training of officers for these units, and for about six weeks the work of the school was practically at a standstill.

In addition to the officers and enlisted men already spoken of as being sent to base hospitals, evacuation hospitals, and mobile hospitals and the Rockefeller Institute, laboratory officers were supplied to various other institutions connected with the Army, as department laboratories, Surgeon General's Office, St. Elizabeths Hospital, Bureau of Mines experimental station, the pathological section of the Chemical Warfare Service. Enlisted technicians were also supplied to these places as called for.

COURSE OF INSTRUCTION

The subjects taught at the Yale Army Laboratory School were bacteriology, pathology, clinical microscopy, and chemistry, so far as it related to clinical diagnosis and the examination of water, foods, and the detection of poisons.

BACTERIOLOGY

Two courses in bacteriology were maintained at the school, an elementary course for those who had little training in the subject before coming to the school, and an advanced course for well-trained bacteriologists. In addition, a course in bacteriology was maintained for enlisted men in order to qualify them as laboratory technicians.

During the early days of the school at Fort Leavenworth, as noted, the officers of the Medical Corps and the Sanitary Corps who were assigned for a course of instruction at the school were well-trained bacteriologists, and the course of instruction was designed to acquaint them with the special methods found of value in the diagnosis and prevention of disease. In order to supply the Army with these specially trained officers it would be necessary to train medical officers and officers of the Sanitary Corps, not only in advanced bacteriology, but also in the elements of the science, so that eventually it was found necessary to divide our officer students into two classes—those who had received good training before arriving at the school and those who had received little or no training in the subject. The first class was placed in the advanced course at the school, the second in the elementary course and afterwards in the advanced course.

The preliminary course consisted in instruction in elementary bacteriological technique and in milk and water analysis. Three hours a day were devoted to this work, and the course lasted approximately four weeks. In the advanced course special bacteriological methods were studied, especially those found of use in Army practice. This course was supposed to cover four weeks, but the time varied considerably, owing to the character of the preliminary training received by the officers who were placed in the course. The advanced course was at first limited to work on typhoid, pneumococcus, streptococcus, and meningococcus. Later, special emphasis was placed on the differentiation of pneumococcus, streptococcus, and the isolation and identification of influenza bacilli. Still later the identification of anaerobes was added to the course. Field conditions were duplicated as far as possible, the students being limited to the apparatus found most useful in field work. Three hours a day were given to the laboratory work, and a daily quiz was given in addition. A series of lectures designed to cover a period of five weeks on subjects of epidemiological and bacteriological interest was also a part of the course. Mimeographed notes of technique and information concerning the subjects taught were distributed to each student, and these notes enabled the instructors to handle a larger number of officers than would otherwise have been possible. When the school closed, the course in bacteriology was being conducted in the new temporary laboratory building, and 200 officers were under instruction, 100 in the morning and the same number in the afternoon.

The course in bacteriology for the enlisted men was intended to fit them for duty as laboratory technicians. While the school was at Fort Leavenworth a total of 105 enlisted men took the course; and during the five months in which the school was at New Haven, 403 enlisted men finished the course of instruction, making a total of 508 enlisted men who finished the course in

laboratory methods at the Yale Army Laboratory School since its establishment at Fort Leavenworth.

There was a very urgent demand for laboratory technicians, and the course was so conducted as to cover the greatest amount of work in as short a time as was compatible with the results desired. It was decided that six weeks was a sufficient period to train a man with intelligence in the work of a laboratory technician; as a matter of fact, it was demonstrated that this period is the minimum to be allowed for this purpose and much better results could be obtained if the course lasted eight weeks. The work consisted of one hour lecture, two hours of laboratory work, and one hour quiz every day with the exception of Saturday. On Saturday a review was held of the work of the preceding week. Owing to the great number of men taking the course, the class was divided into two sections, a morning and afternoon section. The course covered instruction not only in bacteriology but in clinical microscopy.

PATHOLOGY

A course in pathological technique was instituted at the Yale Army Laboratory School, and selected officers and men attending the school were given this special course. The instruction covered autopsy technique, museum technique, and histological technique. Approximately 125 officers were given instruction in pathology, but of these 100 were only in the preliminary stage of instruction when the school closed.

CLINICAL MICROSCOPY

The course in clinical microscopy was attended only by officers. It covered a period of five weeks, and all officers attending the school were obliged to take this course. One week was given to the chemical analysis and microscopic examination of urine, three weeks to the blood, and one week to other clinical laboratory methods. As the class of officers taking bacteriology was divided into two sections, a morning and afternoon section, it was possible to assign a section to the course of clinical microscopy when it was not in the bacteriological laboratory. Thus the officers who were taking bacteriology took the course in microscopy one half of the day and the course in bacteriology the other half of the day. As the two courses covered practically the same length of time, this arrangement was very satisfactory.

CHEMISTRY

The course in chemistry was conducted in the Kent Laboratory of Yale University in a laboratory classroom which would accommodate 100 students. The largest number of students attending this course at one time was 87, and at no time was the work interfered with for lack of room. During the time that the school was in operation at Yale University, 223 officers and 207 enlisted men received instruction in chemistry. The instruction in this subject consisted of water analysis, toxicology, methods of purification of water, and the identification of heavy metals and organic and other poisons. The preparation of Dakin's solution was thoroughly studied, and every officer and enlisted man was trained in its proper preparation.

At the time of the signing of the armistice, nearly 300 officers and over 500 enlisted men were receiving instruction in laboratory methods at the school. At this time the course had been so perfected that it was estimated that efficient laboratory officers could be graduated from the school in a period of eight weeks and enlisted technicians in a period of six weeks. It was the policy of the school to require that all officers attending the school receive not only the course in bacteriology but the course in chemistry. This was rendered necessary by the fact that only 2 officers, 1 bacteriologist and 1 chemist, were sent with field laboratories, and it was thought that the bacteriologist and chemist should be acquainted with both subjects in case of one being unable to attend to his duties from any cause. It was found that this policy was a good one and that even though officers might be ignorant of one of the subjects required, it was possible in the time allowed to impart enough instruction for them to attend to the ordinary work in that subject required in a field laboratory. A large number of chemists were sent to the Yale Army Laboratory School for instruction in chemistry who had received only very elementary instruction in bacteriology. It was found that when these men were placed in the class in bacteriology they took a great interest in this subject, many of them becoming very expert in it. This was not true, however, of medical officers who had training in bacteriology, when it came to the study in chemistry. So that while it was comparatively easy to make a good bacteriologist of the chemist, it was found that it was difficult to make a good chemist of a bacteriologist.

The Army Laboratory School established at Yale University August 1, 1918, was closed for instruction January 1, 1919. While this represents a period of five months during which the school was in operation, for over a month instruction ceased as far as officers of the Medical Corps were concerned, as 56 medical officers were sent to various camps during the influenza epidemic. At the time of the armistice the school was in a position to supply the Army with the necessary laboratory officers and technicians, and had the war continued it would have had no difficulty, it is believed, in keeping the Army supplied with these specialists.

ARMY MEDICAL MUSEUM^a

The Army Medical Museum is the first institution of the Medical Department of the United States Army organized specifically for educational purposes. It was founded in 1862, under Surgeon General Hammond.⁵⁴ Work was at once undertaken on the collection of a large amount of anatomical material, furnished by the aid of the medical officers of the Army, from the dead and wounded of the Civil War, with a view to the scientific preparation and preservation of suitable specimens which would show the action of injurious agents used in war upon the various tissues of the body, the results of complications of war wounds, and the effects of the various diseases affecting the armies upon the human body. It was intended that such material be used for the instruction of medical officers of the Army and other members of the medical profession.

^a This account is based, in the main, on a report of the activities of the museum, by Maj. George R. Callender, M. C., Mar. 30, 1925. Copy on file, Historical Division, Surgeon General's Office.

For a complete account of the museum see: *The Army Medical Museum—A History*, by D. S. Lamb, M. D., *Washington Med. Annals*, 1916, xv, No. 1, 15.

The material so collected, together with the specimens which have been added from time to time from the various hospitals of the Army, numbers many thousands of specimens, which have constituted a valuable source of pathological material for research and training, not only of medical officers of the Army, but of the medical profession at large. The initial collection was the basis of much of the work and most of the illustrations of the Medical and Surgical History of the War of the Rebellion.

Coincidental with these activities of the museum, a collection of photographs was made during the Civil War, and since that time, of many living cases showing the wounds of war in an open, partially healed, or healed condition. Some of these photographs have been used for exhibition purposes and display, others have been placed on file for reference purposes, while many were used in illustrating the Civil War history.

During the Spanish-American War little opportunity was afforded to collect material illustrating the wounds of war, but numerous specimens of the intestinal diseases, particularly typhoid, were collected and studied, though little of educational value was derived therefrom.

After the United States entered the World War, under the inspiration and direction of the curator of the Army Medical Museum, and to fulfill the demand for illustrated material, models and other agents intended to portray and interpret subjects for training of officers and enlisted men, the function of the Army Medical Museum was expanded to provide a means for the production and circulation of photographs, lantern slides, moving-picture studies, wax models, paintings and drawings of original subjects, to be used in immediate training as well as for permanent use in perpetuating the professional and other material in the archives of the Surgeon General's library and the collections of the Army Medical Museum.

The activities assumed such proportions as to require their administrative decentralization from the pre-war activities of the institution and the designation of "the instruction laboratory" as an affiliated section of the Army Medical Museum, with the following departments: (1) Still photography; (2) moving pictures; (3) anatomical art.⁵⁵

From its inception this laboratory functioned to the fulfillment of its designation. It engaged itself in the organization of trained individuals (officers and enlisted men), who operated to collect material from subjects for the preparation of moving-picture films, photographs, and lantern slides. The laboratory was at the disposal of the officers of the Medical Department in camps, hospitals, and other formations throughout the United States and in Europe, and prepared many thousands of photographs and lantern slides which were used to illustrate the instruction efforts of those engaged in the training of personnel for sanitary services.

In July, 1918, Museum Unit No. 1 was organized and sent overseas for the purpose of collecting pathological specimens, to supply the graphics of the movement of hospitals and other medical units, and to complete the histories of the medical and surgical cases by supplying moving pictures, still photographs, wax models, and colored sketches of these cases.⁵⁶ Many thousands of gross specimens and histological slides were received from the camps and hospitals at home and abroad, covering all the important diseases and injuries observed during the war.

Pathological material quite sufficient for exhaustive investigations of the diseases and wounds of the World War was added to the collection, which was thus increased to over 100,000 gross specimens.⁵⁷ The results of its study are presented in the various professional volumes of this history. The instruction in pathology of the classes at the Army Medical School was based on the material in the museum.

More than 20 enlisted men were especially instructed in the technique of the preparation and preservation of gross and microscopical material and were sent to the various hospital laboratories to preserve material for use of the museum.

Adequate laboratories for developing, assembling, and projecting moving pictures, based on like laboratories of commercial establishments, were placed in operation at the museum, and the instruction laboratory made, produced, and circulated a number of moving-picture films and to a large extent exploited and proved the value of the motion picture on instruction and training.

The value of the training material produced by the laboratory during its existence can not be overestimated, particularly in that it serves as a permanent illustrated history of the work of the Medical Department, as well as a nucleus for training in time of peace.

There now are on file in the Army Medical Museum approximately 30,000 photographs, 120 moving-picture studies of 280 reels, and about 1,000 lantern slides.

As the material for training was collected and expanded, a circulation department was operated in order that this most valuable instruction material would be made immediately available for the courses conducted in camps, hospitals, and other formations. The laboratory did not confine itself to the production of studies for the Medical Department solely, but made an exhaustive study of the necessity for the preparation of material which, by its influence on the basic training of the soldier, would prevent disease, develop morale, and sustain esprit in the Army. Several of these were classical presentations of the venereal problems in its relation to the production of noneffectiveness and disability.

Many valuable pictures of specimens were made by the anatomical artists on duty at the museum, of influenza and pneumonia subjects and the pathological effects of gassing. A great many were produced by the unit in France and forwarded to the museum at the close of the war.

Some 200 wax models illustrating wounds and diseases were made and added to the large collection of moulage work already in the museum. These new specimens are of much better character than the old and have been extensively copied for the purpose of instruction in the medical schools of the country.

The moving-picture department later in the war took pictures of actual operations in training and in combat in the field in Europe and this country, illustrating treatment of the wounded, the training of the officer and enlisted man of the Medical Department, and films descriptive of the various special forms of treatment in the branches of surgery and medicine. The following are prominent among the films produced and circulated for instruction purposes during the period of training: "Training

of the Medical Officer"; "The Regimental Detachment"; "The Field Hospital Unit"; "The Ambulance Company"; "Diagnosis of Tuberculosis"; "Fighting the Cootie"; Mosquito Eradication"; "Activities of the M. O. T. C. at Fort Benjamin Harrison"; "Courtesy"; "The Care of the Horse or Mule"; "Disabilities of the Soldiers' Feet and Treatment"; "The Army Nurse"; "Empyema"; "Exercises for Preventing and Correcting Flat Feet"; "Harness and Harnessing"; "The Housefly"; "Infantry Pack and Equipment"; "Nerve Wounds"; "Reconstruction"; "Simple First-aid Hints."

Although this historical review of the activities of the instruction laboratory as a part of the training efforts of the Medical Department for actual participation in the war is brief, the influence which the result of its work reflected as a part of the program of instruction of personnel of the Medical Department was most beneficial.

The results of the work of this institution are perpetuated in the archives of the Army Medical Museum in the form of a comprehensive collection of moving-picture films intended for teaching purposes, a well-balanced library of photographs of the activities of the Medical Department at home and abroad, and a valuable collection of models and other material which were valuable instruments for general and special training during the war, and probably of greater value in preparation for future conflicts.⁵⁸

CHAPTER VII

PROFESSIONAL SCHOOLS IN MILITARY AND NONMILITARY INSTITUTIONS

In making plans for the care of the wounded overseas it was realized, especially with respect to fractures, that the treatment should be so systematized that the wounded soldier would be under one method from the time he was injured until he left the hospital. In order to accomplish this it was important (1) that there be adopted a standard method of treatment; (2) that medical officers be trained in the use of standard appliances and methods. The latter was the more formidable of the undertakings. This was accomplished, in part, by establishing classes, under eminent surgeons, in various medical centers and sending them, upon the completion of the courses, to the medical officers' training camps and base hospitals to assist in the instruction along the given line.

To this end there were organized, in military and nonmilitary institutions, exclusive of medical officers' training camps, divisional camps, posts, and base and general hospitals, schools for the instruction of medical officers in the diagnosis and treatment of conditions coming within the range of certain of the medical and surgical specialties.

United States Army Auxiliary Hospital No. 1 (war demonstration hospital), Rockefeller Institute, New York City, may be said to occupy an intermediary position, since it was, so to speak, a military organization engrafted upon a nonmilitary institution.

MILITARY INSTITUTIONS

SPECIAL SCHOOLS FOR TRAINING IN DIAGNOSIS AND TREATMENT

PNEUMONIA SCHOOL, BASE HOSPITAL, CAMP JACKSON, S. C.^a

With the concentration of large numbers of men in Army camps, acute respiratory disease was immediately recognized as a very important problem confronting the Medical Department of the Army. Measures were instituted which aimed to prevent the spread of infection by contact with those showing evidence of mild inflammation of the upper air passages. Attempts were made to protect soldiers who volunteered for the purpose against pneumonia by prophylactic vaccination. In addition, efforts were made to discover the bacteriological agent responsible for each individual infection, in order that epidemiological measures might be more intelligently formulated and serum therapy instituted if the type of infection could be influenced by it.

This program required the cooperation of trained epidemiologists, bacteriologists, and clinicians. Courses in bacteriology were arranged and medical officers detailed to them for periods of study. An opportunity for clinical and laboratory training in the care of acute respiratory diseases was offered by the

^a Based on: Clinical Instruction in Acute Respiratory Disease, Camp Jackson, S. C., by Henry T. Chickering and James H. Park, jr., Copy on file, Board of Publications, Surgeon General's Office.

hospital of the Rockefeller Institute (q.v.p. 493), which received patients suffering with pneumonia for treatment and study. Beginning November 1, 1917, medical officers were detailed to that hospital for instruction. They served as internes, were responsible for the ordinary clinical care of the patients, and in addition they performed all the laboratory work in connection with their patients.

In May, 1918, in addition to the instruction offered at the hospital of the Rockefeller Institute, a similar course of study was begun at the base hospital, Camp Jackson, under the direction of a medical officer who had assisted in the training at the Rockefeller Institute.¹ This camp, with a population of from 30,000 to 60,000 men, furnished ample clinical material throughout the summer months.

To facilitate this study of acute respiratory diseases, the chief of the laboratory provided one room which became known as the laboratory of the pneumonia school. A special appropriation was granted by the Surgeon General to equip this laboratory and to purchase the necessary supplies, materials for culture media, and laboratory animals. Here it became possible for every officer to become familiar with the cultural characteristics and pathogenicity of the common bacterial flora of the nose, throat, and deep respiratory passages. Cultures were made from the secretions of the nose and throat and from the sputum, on blood agar and Avery medium. Mouse inoculations with sputum to facilitate the determination of the type of pneumococcus were made in each case. In addition lectures were given on the bacteriology of the respiratory tract and the clinical application of the laboratory study of acute infections.

During the summer two wards, of 32 beds each, were provided for the treatment of cases of acute respiratory disease. Upon admission to the base hospital all patients were held in reception wards until a tentative diagnosis allowed of their proper distribution.

The observation wards were situated close to the bacteriological and Roentgen laboratories. Fluoroscopic examination of the chest proved of diagnostic value in the very early stages of bronchopneumonia and lobar pneumonia and was always resorted to when patients complained of symptoms referable to the respiratory tract, even though by physical examination no signs of pulmonary involvement could be detected. When clinical examination was unsatisfactory, the fluoroscope frequently revealed increase in density in localized areas of the lung and restriction of the movement of the diaphragm on the affected side. In addition, specimens of sputum and blood could often be obtained for examination a day or more before signs of definite consolidation were evident.

At Camp Jackson officers were detailed to the pneumonia school for instruction for periods of one month, there being usually 6 or 7 men in each class. The patients were assigned in rotation, so that ordinarily each physician would have not more than 10 or at most 12 under his care at once. Each student learned to recognize the difficulties incident to the accurate study of the bacterial flora of the nose, throat, and pulmonary infection. In order to insure an intelligent prognosis, emphasis was placed upon repeated sputum examinations when only a pneumococcus of Type IV was found.

When serum treatment was indicated, instruction in the proper method of intravenous administration was given, together with the technique of determining the individual's sensitiveness or lack of sensitiveness to horse serum. By attention to these details no accidents attributable to serum were experienced.

From May 27 to September 15, 1918, upon which latter date the so-called influenza epidemic commenced at Camp Jackson, 192 cases of pneumonia were treated in the pneumonia wards by officers detailed for duty in the pneumonia school, and 20 officers were given instruction. The mortality of the cases treated was 7.7 per cent.

SCHOOL FOR THE DIAGNOSIS AND TREATMENT OF TUBERCULOSIS AND THE
ADMINISTRATION OF TUBERCULOSIS HOSPITALS, UNITED STATES ARMY GEN-
ERAL HOSPITAL NO. 16, NEW HAVEN, CONN.

In February, 1918, the Surgeon General recommended leasing, for use as a general hospital for the treatment of tuberculosis, the William Wirt Winchester Memorial Tuberculosis Hospital, situated 2 miles west of New Haven, Conn., and then just nearing completion.² This suggestion was approved by the Secretary of War, and the lease was executed.³ The hospital was opened for sick soldiers on March 7, 1918,⁴ and on March 21, 1918, it was designated General Hospital No. 16.⁵

A school of instruction was organized in this hospital for the training of medical officers in the physical diagnosis and treatment of tuberculosis and in the administration of general hospitals, including the duties of officers assigned to the various departments of general hospitals especially those for the treatment of tuberculosis, with the view of training medical officers for service at tuberculosis hospitals.⁴

The courses covered a period of six weeks. The instruction was largely practical. The microscopical appearance of tuberculous lesions was presented and the relation of these lesions to the clinical course and to the physical signs. The interpretation of X-ray plates was stressed particularly from the clinician's point of view.

The following subjects were covered: ⁴ (1) Physical diagnosis (normal and pathological chest). (2) Administration of wards in a general hospital, especial attention being given to treatment and record work. (3) Routine laboratory work. (4) Interpretation of X-ray plates. (5) Diagnosis and treatment of nasopharyngeal conditions. (6) General pathology, with special attention to the lung, with capital autopsy study. (7) Treatment of tuberculosis. (8) General administration of a military hospital, with practical work by: (a) Commanding officer, (b) supply officer, (c) mess officer, (d) adjutant, (e) registrar. (9) Military instructions by the detachment commander: (a) Management of a medical detachment, (b) drill, (c) setting-up exercises. (10) Reconstruction work. (11) Special instructions in the rapid examination of recruits.

The number of medical officers who took the course was 257.⁴ The distribution of medical officers who attended the school was as follows:⁴ Assigned to other hospitals as ward surgeons, 103; to special examining boards, 77; to base hospitals as specialists in lung diseases, 4; commanding officer in general

hospital, 3; medical chief in general hospitals, 2 of whom later became commanding officers, 7; other assignments, 18; discharged or transferred to other sections of the Medical Department as not suitable for this section, 24.

Some medical officers of the Regular Medical Corps took this course of instruction, which was more comprehensive and of longer duration than any of the similar courses given. The principal benefits arising from the course were the standardization of methods, the learning of the exact meaning of the terms employed in tuberculosis work, the manner of making diagnosis, the interpretation of physical signs, and the common method of treatment.

All courses of instruction were discontinued on October 7, 1918, on account of the influenza epidemic, and the instructors used as consultants in the influenza wards.⁶

SCHOOL FOR INSTRUCTION IN CARDIOVASCULAR DISEASES, UNITED STATES GENERAL HOSPITAL NO. 9, LAKEWOOD, N. J.

It was early determined by the Surgeon General that the medical staff of each of the large base hospitals should include a cardiovascular specialist; that is, an officer with adequate training in the modern aspects of cardiac diagnosis, including a familiarity with the use of the polygraph and the electrocardiograph. In order to supplement the supply of officers with these qualifications a course of instruction was given at the hospital of the Rockefeller Institute in the summer and autumn of 1917.

Considerable difficulty was experienced in securing a sufficient number of properly qualified cardiovascular examiners, and it was soon found necessary to establish at the medical officers' training camps at Fort Riley and Fort Oglethorpe special courses of training for such examiners. These were short intensive courses, taking only from two to three weeks and designed to meet the special diagnostic requirements of the cardiovascular examinations.

Upon the opening, in June, 1918, of General Hospital No. 9, at Lakewood, N. J., with its special heart service, courses of instruction in cardiac diagnosis and also in the management and physical training of the functional heart disorders were begun there and were continued up until the time of the closing of the hospital.⁷

The need for specially trained officers to take over the management of the great number of cases of irritable heart which were accumulating in the camps of this country and of France became very great, for the results of treatment were found to depend largely upon the skill and special training of the officer assigned to their care. By an arrangement made with the British authorities, a certain number of our medical officers, selected for such special work in the American Expeditionary Forces were given a few months of valuable training at the Army heart hospital at Colchester, England, before proceeding to their stations in France.⁷

The problem of the hospital care of the heart cases, especially of those cases returned from overseas, came in for much consideration and discussion and was finally met by the decision not to attempt to concentrate all heart cases in special heart hospitals, but to designate a number of general hospitals to which heart cases might be sent, and to use one hospital (General Hospital

No. 9, Lakewood, N. J.) for the special study of the form of heart disorders which constituted the real heart problem of the Army, namely, the functional disorders known as the irritable heart of the soldier.⁷

For this purpose a special heart service was established in the hospital, which was supplied with thoroughly equipped laboratories and a staff of especially trained assistants. Much valuable information was obtained from the study of these cases and, following the lead of the British Army, methods of treatment by means of graded physical exercises were developed and standardized.⁷

The following outline issued by the Surgeon General's Office for use at the medical officers' training camps was enlarged upon, the course extending, at first, over a period of three weeks and later including an additional week's instruction in nephritis and arthritis.⁸

OUTLINE OF CURRICULUM FOR A COURSE IN PHYSICAL DIAGNOSIS OF THE CARDIOVASCULAR SYSTEM AND OF HEART DISEASE, OF TWO WEEKS' DURATION

One hour, anatomy of the normal heart and physiology of the circulation.

Eight hours, physical examination of the normal cardiovascular system. Attention in these eight hours of practical exercises should be given to the following subjects:

1. Inspection of the heart and all peripheral vessels.
2. Palpation of the cardiac impulse and of the peripheral vessels.
3. Outlining by percussion the area of cardiac dullness and of dullness over the great vessels.
4. Auscultation of the heart, with special reference to the quality of the first sound.
5. Estimation of pulse rate and of blood pressure.

(The examinations indicated in 1, 2, 3, 4, and 5 should be made both in the upright and in the dorsal position; those in 2 and 4 should be made likewise when the patient is lying first, on the right, and then on the left side. The examinations indicated in 1, 2, 4, and 5 should be made before and after varying degrees of exercise, and particular attention should be paid to the alterations induced by exercise.)

Eight hours, study, by methods indicated above, of such functional deviations from the theoretically normal as—

- (a) Cardiorespiratory murmurs.
- (b) Systolic murmurs in the absence of hypertrophy.
- (c) Sinus arrhythmia.

One hour, consideration of Circular No. 21.

Four hours, consideration of irregularities. (Here stress should be laid upon such irregularities as those produced by sinus arrhythmia and premature contractions, since these are irregularities which occur most commonly in young men and are of military importance.)

Twenty-six hours, practical examination of abnormal cardiac lesions with special reference to diagnosis and military prognosis. During this period, one hour should be devoted to the significance of the history of infectious diseases such as rheumatism, chorea, tonsillitis, and of such incidental complaints as growing pains, in estimating the importance of the physical signs which are present; consideration of the subjective symptoms of heart failure and to a discussion of the physiology of heart failure and its early and late physical signs. Two hours should be devoted to functional cardiac disorders (the "irritable heart of soldiers," Da Costa; "effort syndrome" or "D. A. H." of Lewis.)

One hour, special differentiation of this functional cardiovascular disorder from mitral stenosis.

One hour, treatment of functional cardiovascular disorder.

Thorough history taking was regarded as a very important part in the study, classification, and grouping of cases. The following is an outline for history taking, as used in the instructions to new ward men:⁹

HISTORY TAKING

I. Family history. Aside from the routine history, inquire for evidence of neurological, neurotic, or hysterical disturbances. Also history of alcoholism, drug habits, etc.

II. History of infancy and childhood. Diseases; conditions that might have influence on later development; early nervous manifestations; enuresis, chorea, fainting attacks, etc.

III. School history. Progress in studies; final grade and at what age; leaving school; games and sports; if sedentary, learn why.

IV. Occupational history. If there has been a frequent change of work, learn why; nature of last work before military service; heavy or light work, with or without symptoms; time lost from illness or symptoms.

V. Personal history. Sexual; alcohol; tobacco, etc.

VI. Military History. Date of entrance; enlistment or induction; history of service in American camps; full or light duty; if latter, why; dates of transfer to various camps in United States; overseas service—after O. S. examination or not; date of sailing; overseas service (where performed; full or light duty; if latter, why; illnesses and hospitals entered; give dates and names; date of return to United States; record after landing in United States; date of entrance into No. 9).

VII. Present symptoms, with duration and asserted cause.

VIII. Anything in the general attitude, mental or otherwise, that might be an aid in analyzing an existing nervous condition.

NOTE.—Organic as well as functional cases should be analyzed for evidence of any form of inferiority; as, intelligence defects; chronic invalidism; neurotic or hysterical manifestations; focal disturbances; reactions of the emotionally sensitive; etc.

GROUPING OF THE NONORGANIC CASES BY MEANS OF HISTORY STUDY

I. Nonorganic cases; effort syndrome.

a. Physical strain. Have carried on well at the beginning of training, but gave out on severe effort; normal history previous to service; may occur after a return to full duty following too short postoperative convalescence.

b. Postinfections.

(*a*) Following rheumatic fever.

(*b*) Following other infections. Careful study fails to show any signs of organic disease.

c. Constitutional inferiority.

(*a*) Intelligence defects. May not be physically weak; lack ambition and push.

(*b*) Physical inferiors; chronic invalidism; may show full normal mentality; often have associated neurotic characteristics.

d. Emotionally sensitive. Break under severe, sudden nervous strain; retention of fears for long period; previous history usually normal.

e. Neurotic. Somatic manifestations; fainting, vomiting, etc.

f. Neurological. Basis of organic disease; epilepsy, old meningitis, etc.

The most common types in cases from the American camps are the physical inferiors and the primarily neurotic.

The following exercises were in use in the cardiovascular service in the treatment of cases and instructing personnel for cardiovascular work:⁹

GRADED EXERCISES FOR THE CARDIOVASCULAR SERVICE, GENERAL HOSPITAL No. 9, LAKEWOOD, N. J.

These graded exercises are used in the study of both organic heart disease and in those cases showing the symptom-complex of the effort syndrome. The exercises are arranged on a basis of eight units in the following order: (1) Arms; (2) head and chest; (3) balancing; (4) trunk bending forward and backward; (5) arms, legs, and feet; (6) trunk bending sideward; (7) marching, running, etc.; (8) breathing. The order of the units is the same in each grade. In the lowest grade, the movements are given slowly. With the advancement

through the grades, the movements are given in faster time and with increased snap to the commands. By use of this unit plan the exercises are easily graded from the most simple to the complex. All exercises are given twice a day. The sixth, highest grade, includes work in double time, with a period for games.

A medical officer is present at all exercises. It is his duty to detect the earliest signs of effort on the part of the organic cases and immediately refer them for examination. By encouragement, discipline, and general talks on physical development to the functional cases, he is able to keep them up to their full effort. Repeated examinations of functional cases is avoided. This medical officer has charge of the strength tests. This test is made on each patient when he first begins exercises, and is repeated every four weeks until the man is discharged from the hospital.

INTERPRETATION OF THE COMMANDS

Arms forward: Arms straight, shoulder high and shoulder width apart, palms inward.

Arms fore upward: Arms raised upward by passing through arms upward position.

Arms sideward: Arms shoulder high, hands slightly behind the line of the shoulders, palms downward.

Arms side upward: Arms raised through arms-upward position, palms turned inward as the arms are raised upward above the shoulders.

Arms backward: Arms raised over head and backward as far as possible, with chest raised.

Hands on hips: Hands firmly on hips, thumbs to rear, elbows and shoulders well back.

Arms bent for thrust: Arms bent, elbows close to sides, forearms vertical, hands clenched at side of shoulder, knuckles outward.

Arms bent for strike: Hands clenched over shoulders, knuckles to the rear, elbows shoulder high and well back.

Support line frontways: Weight supported on hands and toes, the arms, trunk, and legs straight.

Trunk bent forward; Back bent as much as possible, head up, knees straight. Heads lead in return movement.

Trunk lowered one-half forward: Back flat, head up, trunk carried midway between vertical and horizontal positions.

Trunk lowered forward: Back flat, trunk to horizontal, head up.

Trunk bent backward: Chest raised, head and neck lowered backward as a unit, chin in, knees straight. The bending is in the upper spine.

Trunk bent sideward: Body bent directly sideward, knees straight, feet flat on the floor.

Chest raised: The chin drawn in and the chest raised upward and forward.

Heels raised: Heels raised, ankles fully extended, weight on toes, heels slightly separated.

Knees bent: Heels raised and slightly separated, knees bent outward, body erect, head up.

Leg raised: Body held erect, chest raised, leg raised as high as possible, knee and ankle extended.

Foot placed: Foot placed in given direction, toes touching floor, leg straight, weight on stationary foot. Feet about 18 inches apart.

Stride: Weight equally divided on both feet, feet flat on floor. Feet about 24 inches apart.

Side step: In given direction, weight transferred to stepping leg, heel of stationary foot raised. Distance about 24 inches.

Lunge: Leg raised and step taken in given direction, knee of stepping leg bent, feet flat on floor, body erect. Distance about 24 inches.

Feet closed: Inner edges of feet together, knees pressed together.

Head lowered backward: Chin drawn in, head and neck lowered backward as a unit.

RHYTHM OF MOVEMENTS

Arm and leg movements are usually taken in fast rhythm.

Trunk and head movements are always taken in slow rhythm.

The balancing exercises are done on count or command. These are the third exercises in each group.

In compound exercises, the rhythm is that of the slowest movement.

UNITS OF EXERCISES

Each lesson consists of eight exercises or units and the order of these should not be changed.

- | | |
|--------------------------------|----------------------------|
| 1. Arm, leg, and foot. | 5. Same as unit 1. |
| 2. Head and chest. | 6. Trunk sideward. |
| 3. Balancing. | 7. Marching, running, etc. |
| 4. Trunk forward and backward. | 8. Breathing. |

EXERCISES

Grade I (15 minutes)

1. Raise arms side upward (1). Return (2).
2. Arms bent for thrust: Straighten arms sideward and raise chest (1). Return (2).
3. Bend arms for thrust: Raise heels and chest (1). Return (2).
4. Hands on hips: Lower trunk one-half forward and exhale (1). Return (2).
5. Bend arms for thrust (1). Straighten arms upward (2). Return (3, 4).
6. Hands on hips: Bend trunk left (1). Return (2). Right (3, 4).
7. March in place (1 minute).
8. Raise arms sideward and inhale. Lower and exhale.

Grade II (15 minutes)

1. Arms bent for thrust: Thrust arms forward (1). Return (2).
2. Raise heels and chest. Inhale (1). Return (2).
3. Bend knees one-half deep (1). Return (2). (Hands on hips.)
4. Hands on hips: Raise chest and inhale (1). Lower trunk one-half forward and exhale (2). Return (3, 4).
5. Arms bent for thrust: Swing left leg forward (1). Return (2). Right (3, 4). Trunk kept erect.
6. Side stride stand: Bend trunk left sideward and raise right arm side upward (1). Return (2). Left (3, 4).
7. March in place (2 minutes).
8. Raise arms fore upward and inhale. Lower side downward and exhale.

Grade III (20 minutes)

1. Raise arms fore upward (1). Return (2). Raise arms side upward (3). Return (4).
2. Raise arms forward (1). Move arms sideward, raise chest and inhale (2). Return (4).
3. Bend knees and raise arms sideward (1). Return (2).
4. Side stride stand: Hands on hips. Lower trunk forward (1). Return (2).
5. Arms bent for thrust: Swing left leg sideward (1). Return (2). Right (3, 4).
6. Arms bent for thrust, feet closed: Turn trunk left (1). Return (2).

Grade IV (25 minutes)

1. Raise arms backward (1). Swing arms fore upward (2). Return (3, 4).
2. Bend arms for thrust and lower head backward (1). Return (2).
3. Raise left leg forward and arms sideward (1). Return (2). Right (3, 4).
4. Side stride stand: Swing arms fore upward (1). Bend trunk forward and touch floor (2). Return (3, 4).
5. Raise heels and raise arms side upward (1). Bend knees, arms sideward (2). Return (3, 4).

6. Feet closed, arms sideward: Turn trunk left (1). Return (2). Right (3, 4).
7. Hike (15 minutes).
8. Hands front of shoulders: Straighten arms sideward, palms up, and inhale (1). Return and exhale (2).

Grade V (35 minutes)

1. Feet closed, arms bent for thrust: Turn trunk left and thrust right arm forward (1). Return (2). Right (3, 4).
 2. Arms bent for thrust: Straighten arms sideward, palms up, raised chest, and inhale (1). Return (2).
 3. Raise arms sideward and left leg forward (1). Move left leg backward and lower trunk one-half forward (2). Return (3, 4).
 4. Hands front of shoulders: Lower trunk one-half forward and exhale (1). Raise trunk, raise arms sideward, and inhale (2).
 5. Arms bent for thrust: Lunge left and thrust sideward (1). Return (2). Right (3, 4).
 6. Hands on hips: Turn trunk left (1). Bend trunk forward (2). Return (3, 4).
 7. Run in place (20 seconds). Breathing exercises. Repeat the run.
 8. Raise arms forward and inhale. Lower sideward and exhale.
- The free exercises cover about 20 minutes and should be taken in full time with brisk, snappy rhythm.

Grade VI (60 minutes)

1. Bend arms for thrust and place left foot back inward (1). Lunge left sideward and thrust arms sideward (2). Return (3, 4).
2. Stop left forward, raise arms sideward, raise chest and inhale (1). Return (3).
3. Raise left leg backward, hands front of shoulders (1). Lower trunk forward, arms sideward (2). Return (3, 4).
4. Lunge left sideward and bend arms for thrust (1). Thrust arms sideward and lower trunk forward (2). Return (3, 4).
5. Bend knees and place hands on floor (1). Support line frontways (2). Bend arms (3). Return (4, 5, 6).
6. Side stride stand, hands on hips: Bend trunk forward (1). Circle trunk left (2). Backward (3). Right (4). Forward (5). Raise trunk (6). Repeat, with circle trunk right.
7. Run in place (1 minute).
8. Raise arms fore upward and inhale. Lower side downward and exhale. Vigorous games (15 minutes). Games: Dodge ball, cage ball, volley ball, relay races, basket ball, tag games, etc. Hike (20 minutes). Part of hike in double time and rest in quick time. A swim may be substituted for part of hike.

UNITED STATES ARMY AUXILIARY HOSPITAL NO. 1, WAR DEMONSTRATION HOSPITAL,
ROCKEFELLER INSTITUTE FOR MEDICAL RESEARCH, NEW YORK CITY ^b

The various war activities of the Rockefeller Institute for Medical Research were made possible on the large scale on which they were conducted through the aid of the Rockefeller Foundation, which supplemented the available funds of the institute in a generous manner. Through the large appropriations made to the institute by the foundation for war purposes, the institute was enabled to undertake certain teaching and other activities which it was in a position to conduct with advantage.

^b The statements of fact appearing herein are based, in the main, on the "History of United States Army Auxiliary Hospital No. 1, New York City," by Maj. George A. Stewart, M. C., United States Army, while on duty as a member of the staff of that hospital. The material used by him in the compilation of the history comprised official reports from the various divisions of the hospital. The history is on file in the Historical Division, Surgeon General's Office, Washington, D. C.—*Ed.*

These war activities, for the most part, were outside the normal work of the institute as designated by its founder and board of trustees; however, the imminence of war with and then later the actual declaration of war against Germany, led the corporation of the institute to readjust its general kinds of activities, in order to place the facilities of the institution on a war basis.

Fortunately, the institute had made contributions looking toward the prevention and curative treatment of disease which offered immediate application to some of the medical problems likely to arise in connection with the greatly enlarged personnel of the Army and Navy, and with the inevitable casualties of large training camps in actual warfare. For example, the institute had worked out curative sera for epidemic meningitis and one of the forms of pneumonia, both of which diseases have always appeared in greater or less force in large military organizations; also, under the support of the Rockefeller Foundation, Carrel, in conjunction with Dakin, had perfected, at Compeigne, France, a method of treating surgically infected wounds which had come to have wide applicability in practice. It seemed right and proper, therefore, that the Rockefeller Institute should employ its resources in men and facilities in the service of the Surgeon Generals of the Army and Navy in dealing with their large and important problems.

Meanwhile, the personnel of the institute suffered considerable depletion, as a considerable number of the scientific staff insisted on going into active service with the expeditionary force; but a nucleus of the staff was reserved, through cooperation with the Government, and indeed even augmented by special consignments made by the Surgeon General of the Army, in order that the particular service which the institute could render the Government might be carried out.

The war demonstration hospital of the Rockefeller Institute was planned as a school in which to teach military surgeons the principles of and art of applying the Carrel-Dakin treatment. The idea of a teaching hospital of this kind was conceived after the diplomatic break of this country with Germany occurred, and before war was actually declared against that country. It was also thought of as a model of a base hospital which might be studied by military authorities in the United States; and hence it was constructed on what was regarded as the best plan for such hospitals as developed on the Western Front. The hospital was essentially a portable structure, including two wards of 24 beds each and all the necessary subsidiary units. The unique feature was a large laboratory for teaching the technique of bacteriological control of the wounds, and for research on problems arising out of cases admitted or suggested by the general subject of wound infection.

In order to arrange for the admission to the hospital of wounded soldiers from overseas it was necessary for the war demonstration hospital to have an Army status. Therefore, on August 24, 1918, the hospital, in connection with the United States Auxiliary Laboratory No. 1, was reorganized as United States Army Auxiliary Hospital No. 1 and placed under the command of the port of embarkation, Hoboken, N. J., with a captain of the Medical Corps as commanding officer, a captain of the Sanitary Corps as adjutant, and a

sergeant of the Medical Department in charge of the sick and wounded records.¹⁰ No other change in the staff was made.

INSTRUCTION

Instruction was given to medical officers of the Army and Navy, to enlisted men in both services, to civilian surgeons, and to female nurses of the Red Cross and civil hospitals. The classes were conducted in the wards, in the operating room, and in the laboratory; and various devices were used to illustrate and enforce the teaching. The medical officers and others (e. g., chemists and bacteriologists) were taught the principles of the Carrel-Dakin method of the treatment of war wounds and were required to cover, by personal observation or operation, all the essential points involved in its proper application. They learned to prepare and to titrate the Dakin solution, to make microscopical examinations in the bacteriological laboratory, and to prepare the wound and apply the treatment in the operating room and at the bedside.

The course of instruction for medical officers covered ordinarily a period of two weeks. Two classes, therefore, were conducted each month. At first the patients were civilians suffering from a wide variety of infected wounds. After the American Army had begun active military operations in France and the wounded began to be returned to the United States, the soldiers suffering from infected war wounds displaced the civilians. The first overseas case was received on August 31, 1918. The first class reported for instruction on August 2, 1917, and the last class completed its work on March 29, 1919.

The following is a detailed account of the number of courses given, and the number of persons receiving instruction:

Number of courses given:		Number of persons receiving instruction—Continued.	
Surgical classes.....	41	Special instruction—Continued.

^c This course was organized on April 1, 1918. It consisted of three days' instruction in the chemistry of antiseptics.

^d This course was organized July 1, 1918. One week's instruction given in laboratory methods used in conjunction with treatment of wound infection.

The complete surgical course embraced the following three subjects: Surgical clinic; laboratory methods; chemistry of antiseptics. The following schedule outlines the complete course:

Complete surgical course

FIRST WEEK

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
	9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic
	10 to 12.15 Lecture room: and chemical laboratory: Antiseptics; Dakin solution	10 to 11 Surgical laboratory: Preparation of surgical dress- ing 11 to 12.15 (Half) Surgical laboratory: Tubes; dress- ings. (Half): Bacteriological laboratory: Smears	10 to 12.15 Chemical labora- tory: Antisep- tics (continued)	10 to 12.15 Chemical labora- tory: Preserva- tion of Dakin solution	10 to 11 Bacteriological laboratory: Action of anti- septics on bac- teria 11 to 12.15 Lecture room: Blood trans- fusions

12.15

Luncheon

2 Assembly, lecture room		2 to 3.30 (Half) Bacteriological laboratory (con- tinued). (Half): Surgical laboratory: Dressing; tubes	2 to 3.30 Central building, fourth floor: Resus- citation and other therapeutic methods	
2.30 Lecture room: General principles	2 to 5 Chemical laboratory (continued)			2 to 5 Chemical laboratory (continued)
3.30 Lecture room: Bacteri- ological smears		3.30 to 5 Application of appara- tus and dressings, surgical laboratory	3.30 to 4 Lecture room: Anes- thesia	

SECOND WEEK

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic	9 to 10 Clinic	
10 to 12.15 Bacteriological lab- oratory: Action of antiseptics on necrotic tissue and on dressing mate- rials	10 to 12.15 Chemical labora- tory: Effects of blood and tissue on antiseptics	10 to 11.30 Lecture room: Importance of mechanical cleansing	10 to 12.15 Lecture room and laboratory: Fractures	10 to 12.15 Chemical labora- tory	

11.30 to 12.15

Cicatriztion

Complete surgical course—Continued

12.15

Luncheon

2 to 5	2 to 5	2 to 3.30	2 to 3.30	1.15 to 2.30
		Lecture room: Tetanus	Lecture room: Gas infection	Chemical laboratory
Bacteriological laboratory: Antiseptics on blood, muscle, skin	Chemical effects of living tissue on antiseptics	3.40	3.30	3
		Bacteriological laboratory: Results	Chemical laboratory: Examination	Lecture room

In carrying out this schedule from the clinical side, ward rounds were made, operative and dressing clinics held, lantern slides and motion pictures shown to demonstrate the necessity for an exact method of treating infections and the importance of following the four essential principles of the Carrel-Dakin method—mechanical or surgical cleansing, chemical sterilization, bacteriological control, and closure. The routine of teaching followed is briefly summarized.

Mechanical cleansing.—Using careful surgical technique, the surrounding skin was cleansed. In some superficial wounds it was possible to sterilize by mechanical means, scrubbing with neutral soap and water being sufficient at times. In the more highly infected wounds, involving the deeper structures, it was not only necessary that the outside be cleansed, but that a thorough, careful surgical operation be performed. Faulty mechanical cleansing can lead to only one result—continued infection, with loss of function, or in many cases loss of life. It was impossible to teach men surgery and surgical judgment in the brief space of two weeks, but it was possible to emphasize the principles of thorough and careful preparation as to the stages of treatment, if the condition of the patient made this necessary.

Chemical sterilization.—Chemicals could not, of course, be expected to dissolve out and thus remove foreign bodies such as fragments of shell, clothing, bone, etc. The proper clinical use of the chlorine was demonstrated to the classes, and emphasis was laid on the point that in the employment of antiseptics the three cardinal principles of time, concentration, and contact must be observed at all times.

Control.—Observation with the eye alone would not tell the true condition of a wound. To assist in this work, two methods were available: The curve of cicatrization, and the bacteriological control by means of smears and cultures. The former was intended mainly for scientific purposes and not for everyday clinical use. It indicated what effect an antiseptic or method of treatment had upon the rate of growth of epithelium. For practical purposes, the bacteriological smear control of the wound was of greater value. If mechanical and chemical sterilization had been carried out properly, the bacterial count would fall. If there was a rise or irregularity, the cause was usually a fault in the mechanical cleansing or in the application of the antiseptic, rather than in the method itself.

Closure.—After the control had shown the wound to be sterile, it might be safely closed by any surgical procedure, such as a simple suture, fat transplant, skin flap, skin graft, or other method suited to the case.

The total number of cases admitted to the hospital during the periods of its active service was 325.

LECTURES AND DEMONSTRATIONS

Resuscitation.—The lectures on the methods of resuscitation consisted in an experimental demonstration on animals of the efficiency of the method of pharyngeal insufflation. The thorax of etherized or curarized dogs was either transversely split or the walls completely removed, thus exposing lungs and heart to full view of the entire class. Without the aid of artificial respiration the lungs, of course, collapsed and as a consequence the heart slowed up. Shortly after the heart stopped beating, pharyngeal insufflation was instituted, which caused immediately the rhythmical distention of the lungs, and the heart recovered, sometimes in less than one minute. The experiment was always a success and made a profound impression upon the classes.

Tetanus.—Regarding the treatment of tetanus, three points were discussed: (1) The removal of the primary cause by proper surgical methods; (2) the neutralization of the free toxin in the blood and the lymph by means of a thorough serum treatment; (3) the treatment of the tetanic manifestations after the toxin was once fixed in the nerve cells and thus was not amenable to the neutralizing action of the antiserum. Here chiefly the treatment by magnesium was indicated. The action of magnesium was demonstrated by actual experiments on tetanic dogs: (a) Animals in a severe and dangerous state of tetanus were relieved and restored to nearly normal within a few minutes by a judicious intravenous injection of magnesium sulphate; (b) in another experiment it was shown that an injudicious administration of the magnesium salt might endanger the animal's life; (c) it was finally shown that tetanic animals which received intentionally too much magnesium and thus were in imminent danger could be saved in a few minutes by an intravenous injection of a normal solution of calcium chloride. There were animals in which after receiving a very large dose of magnesium the respiration was completely abolished and the heart's action could not be felt any more; they were nevertheless resuscitated by means of calcium and with pharyngeal insufflation.

SPECIAL INVESTIGATIONS

A number of specific problems which arose in the course of the work of the hospital were studied and several papers published. The following observations were made: (1) It was found that hypochlorite solutions, even if neutral, have the ability to dissolve necrotic tissue, plasma clot, or exudate and pus cells, whence their power of "clearing" the wound and of more efficient bactericidal action, since the bacteria, otherwise protected by the débris or exudate, are readily exposed to the antiseptic effect of the hypochlorite. (2) The chlorine content of hypochlorite solutions diminished more rapidly when in contact with necrotic tissue than with intact normal tissue. On the other hand, chloramine-T solutions are not only more stable, but deteriorate a little

more rapidly in the presence of necrotic than of normal tissue. (3) Dakin's hypochlorite solutions and chloramine-T solutions quickly destroy the exotoxin (Bull) of *B. welchii*. (4) The following antiseptics were tested for poisonous effects on animals and showed decreasing toxicity in the order given: Eucalyptol, brilliant green, mercuraphen, mercuric chloride, chloramine-T, dichloramine-T, proflavine, hychlorite, Dakin's hypochlorite, javelle water, magnesium hypochlorite, iodine, phenol.

In addition to these main points, subsidiary ones to which some attention was given were studied. It was found that of the solutions of hypochlorites and allied chlorine compounds available for clinical use, none showed an appreciable solvent action on blood clot. Hence arose the advisability of proper mechanical cleansing and treatment of wounds, in order to remove and prevent blood clots which might harbor bacteria.

Beginning in August, 1918, instruction was given convalescent patients by aides in reconstruction and occupational therapy.

At the request of the Surgeon General of the Army, the courses in instruction for medical officers were continued until April 1, 1919. The last class completed its work on March 29, after which the patients remaining were evacuated as rapidly as possible and the hospital was closed on April 15, 1919.

UNITED STATES ARMY AUXILIARY LABORATORY NO. 1

The fact was early recognized, once we were at war, that the Surgeon General would make heavy demands upon the personnel of the bacteriological and clinical chemical laboratories of the country. It was thought probable that the existing highly-trained personnel would prove inadequate to meet the needs. On the other hand, it was believed that the recent general addition to the medical curriculum, of bacteriology and its handmaiden, serology, and the corresponding improvement in the teaching of chemistry in medical schools, as well as the creation of many diagnostic laboratories in hospitals, would provide a large number of partially-trained laboratory workers who could readily and quickly be prepared to carry out, either alone or under supervision, diagnostic work in camp laboratories. Other potential sources of workers were the schools of agriculture in which instruction in bacteriology was given. Hence it was proposed to establish training courses in bacteriology, serology, and (later) medical chemistry for this class of students. The Surgeon General approved the project, the laboratory was organized and the Surgeon General assigned medical officers and others to the Rockefeller Institute for instruction.

COURSE IN BACTERIOLOGY

The first requisite was a teaching laboratory. In view of what was stated of the nature of the institute, namely, an institution of pure research for already trained workers, no general instructional laboratory had ever been called for. Fortunately, a new laboratory building of the institute had been recently occupied and contained a large, undivided, and unoccupied space on a convenient floor which could be utilized. The necessary desks and apparatus were quickly assembled and installed, and the first course of instruction opened on June 25, 1917. The instruction covered a period of four weeks (28

days), and the course was repeated once a month. In July, 1918, one week's instruction in surgical bacteriology was added, and in the fall of 1918 one week was set aside for the study of anaerobes. Hence when the classes were discontinued, the instruction covered a period of six weeks. At the outset an arrangement was made for 20 places in the laboratory; later the number was increased to 53. Eligible persons were accepted from the Army and Navy, and when space was available a few civilians who proposed to enter the service were admitted. Eligibility consisted of previous training in laboratory methods, with special reference to bacteriology and serology (immunology).

The course of instruction was planned to be intensive and strictly practical, and to cover a selected set of subjects which it was believed would dominate the demands made on the diagnostic bacteriological laboratory. The work was practical, the student carrying out under the direction of instructors the entire series of operations which he would be called upon to perform in the diagnostic laboratory. A series of brief lectures and demonstrations was designated in order to make the object of the various steps clear to the student, and to connect the operation with the present state of our knowledge and to point out to him the readily accessible articles and books for his further guidance. The schedule which follows represents the subjects taught and the period given to each when the course had been fully developed. In order that the nature and manner of the instruction may be easily apprehended, the plan of instruction in a few of the main subjects is given in some detail.

FIRST WEEK—TYPHOID AND DYSENTERY

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
<p>9 to 10</p> <p>Lecture: Preparation and standardization of media</p>	<p>9 to 10</p> <p>Lecture: Diagnosis—blood, stool, urine, Widal, Dreyer curve, etc.</p>	<p>9 to 10</p> <p>Lecture: Prophylaxis; sanitation; vaccination, preparation of vaccine</p>	<p>9 to 10</p> <p>Lecture: Sanitary analysis of water</p>	<p>9 to 10</p> <p>Lecture: Preparation of immune serum for diagnosis. Serological reactions in experimental and clinical dysentery</p>	<p>9 to 10</p> <p>Lecture: Serum treatment of dysentery</p>
<p>10 to 12</p> <p>Laboratory: Preparation of endo, brilliant green, and sugar media</p>	<p>10 to 12</p> <p>Laboratory: Sugar reactions; fishing and identification of colonies; lead acetate double sugar; slide agglutination</p>	<p>10 to 12</p> <p>Laboratory: Preparation and standardization of vaccine</p>	<p>10 to 12</p> <p>Laboratory: Completion of unknown; bacteriological examination of water</p>	<p>10 to 12:30</p> <p>Laboratory: Examination of stools for <i>B. dysenteriae</i> and unknown culture. Continue culture examination of various types of <i>B. dysenteriae</i>. Agglutination tests with Shiga, Flexner, and polyvalent immune serum and types of different <i>B. dysenteriae</i> cultures.</p>	<p>10 to 11</p> <p>Practical: Completion of agglutination test, etc., for recognition of type of unknown culture and suspected stools</p>
<p>2 to 3</p> <p>Lecture: Characteristics of colon-typoid group</p>	<p>2 to 3</p> <p>Lecture: Epidemiology; water, food, insects, carriers</p>	<p>2 to 3</p> <p>Lecture: Treatment of typhoid</p>	<p>2 to 3:30</p> <p>Lecture: Classification of dysenteric bacilli. Rapid methods of isolation</p>	<p>2 to 3</p> <p>Lecture: Pathology of clinical and experimental dysentery. Differences between <i>B. dysenteriae</i> Shiga from Flexner group</p>	<p>11 to 12:30</p> <p>Lecture: Epidemiology and prophylaxis of dysentery; Army experiences</p>
<p>3 to 5</p> <p>Laboratory: Study of pure culture of colon-typoid and paratyphoid bacilli; colony growth; staining reactions; agglutination; inoculations in sugar media and Russell double sugar; plating of carrier stool</p>	<p>3 to 5</p> <p>Laboratory: Dreyer-Widal, unknown stool</p>	<p>3 to 5</p> <p>Laboratory: Examination of unknown plates, fishing colonies</p>	<p>3 to 5:30</p> <p>Practical: (a) Examination of suspected stool for <i>B. dysenteriae</i>. (b) Study of cultural characteristics of various types of <i>B. dysenteriae</i>. (c) Classification of a culture of a type of <i>B. dysenteriae</i> unknown to the student</p>	<p>3 to 5:30</p> <p>Practical: Injection of rabbits with culture for pathology. Continuation of practical work started previously</p>	<p>Reports on unknown cultures completed this afternoon or Sunday morning</p>

SECOND WEEK—PNEUMONIA ^a

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 Lecture: Biology of pneumococcus	9 to 10 Lectures: Biological classification	9 to 11 Laboratory: Sputum, Avery medium, streptococcus and pneumococcus	9 to 10 Laboratory: Mouse autopsy; study of unknown culture	9 to 10 Lecture: Epidemic influenza	9 to 10 Lecture: Serum treatment
10 to 12 Laboratory: Morphology, staining properties, bile solubility, agglutination, cultures	10 to 12 Laboratory: Fishing colonies, agglutination, mice autopsy	10 to 11 Lecture: Streptococcus 11 to 12 Laboratory continued	10 to 11 Lecture: Pathology—streptococcus and pneumococcus 11 to 12 Study of unknown cultures	10 to 12 Laboratory: Morphology, biology, and pathogenicity of <i>B. influenza</i> ; plating	10 to 12 Finish unknown: study plates of influenza; file report; quiz
2 to 3 Lecture: Type determination	2 to 3 Lecture: Laboratory aids in diagnosis	2 to 3 Lecture: Rapid methods of type determination and soluble substances	2 to 3 Lecture: Epidemiology	2 to 3 Lecture: Serum production and standardization	
3 to 5 Laboratory: Autopsy of inoculated mice; injection of sputum	3 to 5 Laboratory: Autopsy injected mice; plate unknown cultures	3 to 5 Autopsy mice; agglutination and precipitin; capsule stain; injection of sputum	3 to 5 Type determinations; sputum	3 to 5 Laboratory: Study of unknown cultures; type determination on urine	

^a After the outbreak of streptococcus pneumonia in the winter of 1917-18 in the cantonments, instruction on streptococcus was introduced into the course.

THIRD WEEK—MENINGITIS

9 to 10	9 to 10	9 to 10	9 to 10	9 to 10
Lecture: Biology of meningococcus	Laboratory: Autolysis	Laboratory: Making West and nasal swabs; study of Gram-negative diplococci	Lecture: Pathogenicity; clinical diagnosis	Lecture: Epidemiology
10 to 12	10 to 11	11 to 12	10 to 12	10 to 11
Laboratory: Morphology; staining cultures	Lecture: Autolysis, and production of monovalent sera	Lecture: Isolation of meningococci from nasopharynx	Laboratory: Complete test from preceding day. Begin work on "unknown" plates	Laboratory: "Unknown"
	11 to 12			11 to 12
	Injection of rabbits			Lecture: General considerations. Field methods
2 to 3	2 to 3	2 to 5	2 to 3	2 to 3
Lecture: Lumbar puncture, and examination of cerebro-spinal fluid	Lecture: Types of meningococci	Laboratory: Effect of sputum contamination; distribution of meningococci in the pharynx	Lecture: Preparation of therapeutic serum	Laboratory: Titration of monovalent sera; experiment—chemical versus serum treatment
3 to 5	3 to 5		3 to 5	4 to 5
Laboratory: Autolysis; cerebro-spinal fluids; isolation of organisms	Laboratory: Isolation of meningococci from nasopharynx; agglutination		Laboratory: Making plates; swabbing carriers; bleed rabbits	Meeting of institute staff
				Complete unknown and report. Finish Sunday morning if necessary

ANAEROBES^a—FOURTH WEEK

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 Lecture: General considerations; war wounds; preparation of media	9 to 10 Lecture: Rapid methods for identification of anaerobes from war wounds	9 to 10 Lecture: <i>V. septicæ</i>	9 to 10 Lecture: Soluble toxins—tetanus, botulismus, Welch bacillus	9 to 10 Lecture: Anaerobes of secondary importance— <i>B. sporangies</i> , <i>B. histolyticus</i> , <i>B. infernus</i> , <i>B. putrificus</i> , <i>B. fusiformis</i>	9 to 10 Lecture: Aerobic bacteria in wounds; method of obtaining specimens for examination; preservation of cultures
10 to 12 Laboratory: Examination of old cultures; morphology and cultural characteristics	10 to 12 Laboratory: Begin with identification of anaerobes from specimen	10 to 12 Laboratory: Study of the culture; continuation in identification of culture from the specimen	10 to 12 Laboratory: Demonstration of methods of filtration, and cultures; continue identification of cultures from specimen	10 to 12 Laboratory: Study of cultures; continue specimen examination	10 to 11 Laboratory: Report on specimens; practical examination 11 to 12 Reports of war experiences and discussion
2 to 3 Lecture: Methods and apparatus	2 to 3 Lecture: <i>B. welchii</i>	2 to 3 Lecture: <i>B. chauveaui</i> , <i>B. oedematis</i> , <i>B. bellonensis</i>	2 to 3 Lecture: Antitoxins (Rull and Pritchett, Weirberg and Seguin, etc.); polyvalent sera; antitoxic and antitubercular sera; serotherapy (vaccine therapy); prophylaxis	2 to 3 Lecture: Unusual anaerobes— <i>B. fallax</i> , <i>B. pseudotuberculosis</i> , <i>B. teres</i> , <i>B. atrofrigidus</i> ; anaerobic streptococci; gas gangrene	
3 to 5 Laboratory: Demonstrations of methods and technique	3 to 5 Laboratory: Study of culture, transplantation to differential media; injection of guinea pigs	3 to 5 Laboratory: Study of cultures	3 to 5 Laboratory: Neutralization experiments	3 to 5 Laboratory: Study of cultures; pathology of gas gangrene	

^a In the fall of 1918, the course was extended to include instruction in anaerobes. On account of the armistice and the discontinuation of the instruction, only one such course was given.

FIFTH WEEK—MISCELLANEOUS SUBJECTS

9 to 10	9 to 11	9 to 11	9 to 10:30	9 to 10	9:30 to 12
Lecture and demonstration: Intestinal parasites	Lecture: Classification of spirochetes	Laboratory: Dark field ex- aminations	Laboratory: Wassermann reaction	Lecture: Transfusion	Lecture and ward rounds, Willard Parker Hospital, for contagious diseases
10 to 12	11 to 12	11 to 12	10:30 to 12	10 to 12	
Laboratory: Intestinal parasites	Laboratory: Spirochetes	Lecture: Chemotherapy of syphilis	Lecture and demonstration: Pathology of poliomye- litis	Laboratory: Typing blood for transfusion	
2 to 3	2 to 3	2 to 3	2 to 3:30	2 to 3:30	
Lecture and demonstration: Malaria	Lecture: Syphilis	Lecture: Serological diagno- sis of syphilis	Laboratory: Pathology of poliomyelitis	Lecture: Poliomyelitis; epi- demiology and treatment of poliomyelitis	
3 to 5	3 to 5	3 to 5	3:30 to 5	3:30 to 4	
Laboratory: Malaria	Laboratory: Treponema pal- lidum	Wassermann reaction	Diagnosis of poliomyelitis	Lecture: Preparation of cow- pox vaccine and technic of vaccination	
				4 to 5	
				Meeting of institute staff	

SIXTH WEEK OF BACTERIOLOGY OF WOUNDS AND TECHNIC OF TREATMENT OF INFECTED WOUNDS

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
9 to 10 Lecture: Principles of Carrel-Dakin method of treatment	9 to 10 Lecture: Bacteriological control of infected wounds			9 to 10 Surgical clinic: Results of treatment of infected wounds	9 to 10 Demonstration: Preparation of chloramine-T paste and neutral soap solution
10 to 11:30 Lecture and demonstration: Preparation and standardization of chlorine antiseptics	10 to 12:15 Laboratory: Enumeration of bacteria in films from infected wounds	9 to 12 Laboratory: Preparation of Dakin's solution	9 to 12 Laboratory: Solvent action of various antiseptics on surgical dressing material and on fibrin, pus, blood clots	10 to 12:15 Laboratory: Stability of chlorine antiseptics	10 Adjutant's office
11:30 to 1 Laboratory: Titration of chlorine antiseptics					
2 to 5 Laboratory: Preparation of Dakin's solution	2 to 3:30 Laboratory: Preparation of tubes used in Carrel-Dakin method 3:30 to 5 Lecture and demonstration: Apparatus used in treatment	2 to 5 Standardization of Dakin's solution	2 to 5 Demonstration: Action of chlorine antiseptics on the toxius of Welch bacillus	2 to 5 Laboratory: Experiments on decomposition of chlorine antiseptics and in the presence of organic matter	

^a In July, 1918, the period of instruction was extended to include 1 week at the war demonstration hospital of the institute, to receive instruction in the bacteriology of wounds and the technic of treatment of infected wounds.

Each class in bacteriology was sent for half a day to the Willard Parker Hospital, for instruction in the hospitalization of contagious diseases.

The number of persons receiving instruction in the courses in bacteriology was 480; they were distributed as follows:

Officers of the Army	382
Enlisted men of the Army	32
Officers of the Navy	44
Female technicians	4
Civilians	18
Total	480

COURSE IN CHEMISTRY

The course in clinical chemistry was begun April 1, 1918. At first it included only methods of use in clinical diagnosis, but later it was extended to include also the methods of sanitary chemistry which were most called for in the camps. A regular four-year university course in chemistry was required for entrance, with a few exceptions in the cases of Medical Reserve Corps officers sent by the Surgeon General. Part of the men had also completed post-graduate courses for higher degrees. Because the students selected were already familiar with general chemical technique, they were able to complete the following course in one month.

The course included quantitative and qualitative chemical analysis and microscopic examination of urine; quantitative analysis of blood for the determination of acetone, acetoacetic acid,* non-protein nitrogen, urea, chlorides, bicarbonate, oxygen, hemoglobin, and sugar; detection of blood in feces; analysis of gastric contents; functional tests of glucose tolerance in diabetes, bicarbonate retention in acidosis, and phenolsulphonephthalein test for kidney function; sanitary analysis of water, and qualitative tests for poisonous metals and alkaloids; the preparation and standardization of Dakin's solution.

Nine courses in all were given, and the following persons received this instruction:

Officers of the Army	44
Enlisted men of the Army	75
Civilians	7
Total	126

COURSES IN THE DIAGNOSIS AND TREATMENT OF PNEUMONIA

Soldiers suffering from pneumonia were admitted to the hospital of the Rockefeller Institute for treatment to as great an extent as the facilities permitted. The Surgeon General of the Army assigned medical officers to the hospital, where they were taught the methods of pneumonia diagnosis and treatment as perfected there. These officers lived in the hospital and served as internes; they remained for a period of six weeks to several months. After leaving the hospital, in many instances, they served in the pneumonia wards of camp base and general hospitals. The total number of medical officers assigned to this duty was 26. In May, 1918, as the number of pneumonia cases entering the hospital became very few, this instruction was largely transferred to Camp Jackson, S. C., where it was conducted under the direction of a medical officer who had previously been assisting in the work at the Rockefeller Institute.

COURSES FOR TECHNICIANS

Toward the end of the period during which instruction in bacteriology was given, the increasing requirement for technical aid in the Army laboratories suggested the advisability of training a certain number of women in the making of culture media and section cutting and staining. Hence classes were formed consisting of six women who spent two weeks in the preparation room of the institute, in which all the culture media were prepared, and two weeks in acquiring the technique of fixing, hardening, embedding, cutting, and staining of sections of tissue. Forty women availed themselves of this instruction. The course in media making covered the following operations:

Schedule of instruction for women technicians

FIRST WEEK

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
8 to 12 a. m. Practical work in preparation room; sterilizing infected glassware.	8 to 12 a. m. Practical: Cleansing pipettes.	8 to 12 a. m. Practical: Care of porous filters.	8 to 12 a. m. Practical: Wrapping Petri plates.	8 to 12 a. m. Practical: Plugging test tubes.	8 to 12 a. m. Practical: Flasks; special apparatus.
1 to 5 p. m. Practical: Cleaning laboratory glassware in large quantities.	1 to 5 p. m. Practical: Cleaning special glassware.	1 to 5 p. m. Practical: Sterilization methods; dry heat; autoclave; fractional.	1 to 5 p. m. Practical: Plugging and wrapping pipettes.	1 to 5 p. m. Practical: Agglutination tubes.	

SECOND WEEK

9 to 10 a. m. Lecture: Culture media.	9 to 12 a. m. Practical: Preparation of broth.	9 to 12 a. m. Practical: Sugar media.	9 to 12 a. m. Practical: Media for pneumococcus; buffer media.	9 to 12 a. m. Practical: Preparation of solutions used in media room.	9 to 12 a. m. Written examination.
10 to 11 a. m. Demonstration: Calorimetric method of hydrogenion determination.					
11 to 12 a. m. Practical: Titration of media.					
1 to 5 p. m. Practical: Titration.	1 to 5 p. m. Practical: Preparation of agar.	1 to 5 p. m. Practical: Double sugar media and Hiss' serum water.	1 to 5 p. m. Practical: Streptococcus.	1 to 5 p. m. Practical: Preparation of indicators.	

NONMILITARY INSTITUTIONS

SCHOOLS OF FRACTURES AND WAR SURGERY

Late in July, 1917, arrangements were completed whereby officers attached to the division of general surgery of the Surgeon General's Office were enabled to receive intensive instruction along various lines.¹¹ Beginning August 1, 1917,

at Rockefeller Institute (United States Army Auxiliary Hospital No. 1), as noted, the principle of wound healing and the treatment of wounds were demonstrated to classes of approximately 15 men, over a period of 2 weeks for each class. These classes of intensive instructions were made up of officers of the Medical Reserve Corps, men of surgical training, destined for future general surgical activity.

In October, 1917, courses of intensive instruction in the treatment of fractures were suggested:¹²

MEMORANDUM FOR THE SURGEON GENERAL

1. Permission is requested from the Surgeon General to inaugurate courses of intensive instruction in the treatment of fractures of from two to four weeks' duration, in the following cities: Chicago, Boston, Cleveland, Baltimore, Philadelphia, New York, Omaha, Denver, San Francisco, Pittsburgh. Arrangements will be made with clinical teachers who have large traumatic services which include many severe complicated fractures. Many prominent teachers have signified their willingness to cooperate in this work.

2. These courses of special instruction in fractures are for the benefit of a large group of well-qualified surgeons who have been actively engaged in the practice of general surgery during the past 10 years and whose services would be made more valuable if they could receive special instruction in the modern, efficient methods of treating fractures.

3. These courses are also greatly desired for many surgeons who earnestly wish active duty but who can not at present be assigned to training camps because their quota is complete. It is most desirable to keep these surgeons actively occupied in the service and this can be accomplished by assigning them to these courses of instruction, on the completion of which they may be assigned to cantonments, and in turn teach those who have not had the opportunity of receiving the special course of instruction.

(Signed)

WILLIAM H. MONCRIEF,
Lieutenant Colonel, Medical Corps.

Approved: By direction of the Surgeon General.

(Signed)

C. L. FURBUSH,

Major, Medical Reserve Corps.

About the time that these courses of instruction in fractures were being established it was realized that it was not practicable to give courses of instruction in fractures alone, because it was difficult to secure sufficient clinical material to take up the full time of the students, and besides, it was considered desirable to give instruction in the treatment of war wounds in connection with the treatment of fractures; therefore, the courses were arranged to embrace instruction in war surgery and fractures.¹¹

Arrangements were finally made for the establishment of courses, variously designated, in the following cities:¹¹ New York City (exclusive of Rockefeller Institute): Bellevue Hospital (2), Cornell University Medical College (1), Roosevelt Hospital (1). Boston, Mass.: Massachusetts General Hospital (1), Boston City Hospital (1). Philadelphia, Pa.: University of Pennsylvania (1). Pittsburgh, Pa.: Carnegie Building (1). Cleveland, Ohio: Lakeside Hospital (1). Chicago: Rush Medical College (1), Cook County Hospital (1), Presbyterian Hospital (1). New Orleans, La.: Charity Hospital (1). San Francisco, Calif.: Stanford University (1), University of California (1). Rochester, Minn.: Mayo Clinic (1).

The directors of the schools were prominent surgeons in the communities in which the schools were located and the teaching staffs were principally members of the staffs of the institutions in which the instruction was given.

An adjutant, and in some instances an assistant adjutant, was selected from the students by the director to assist in the keeping of records and the rendering of reports of the schools.¹³ At the completion of the courses the students were classified and a detailed report rendered to the Surgeon General showing the qualifications of each man. Weekly and monthly reports were also rendered showing the progress of the classes.

The first classes to be ordered to these schools were principally from the medical officers' training camps. Approximately 70 men were ordered from Fort Benjamin Harrison in November, 1917.¹³ The classes for January, 1918, were selected almost entirely from ambulance and field hospital companies, the idea being for these men to return to their organizations and act as instructors for other members of their units.¹³

The Surgeon General furnished to each school a set of standard splints, which had been adopted for general use in the Army, including a Bradford frame for each school.¹³

A syllabus of the abstracts of War Surgery was sent to each school by the Surgeon General, as indicated by the following circular letter which was used by all schools as a basis for the instruction given.¹⁴ The instruction, therefore, was basically the same in all schools except that at the Rockefeller Institute (q. v.) where the instruction was largely devoted to the treatment of wounds, and at the Mayo Clinic (q. v.) where the courses were along the lines of general surgery.

1. Under separate cover we are sending to you a syllabus containing abstracts of War Surgery. It is hoped that the material it contains may be of value to you and the surgical personnel.

2. Great care should be exercised to preserve this copy. You will acknowledge its receipt since they will be checked against you as part of the property sent for the course, and in case your class is taken over by some one this copy should go to the new instructor as part of the property of the Government.

The abstracts are primarily designed as a basis for the lectures, and the following are suggested as among the subjects which would be of interest to your class: (a) *War wounds*: The circular of November 1 contains an outline of this subject. Considerable emphasis should be placed upon (1) excision; (2) sepsis; (3) tetanus; (4) gas bacillus infection; (5) shock; (6) hemorrhage and aneurysm, primary and secondary; (7) ligation of vessels with a study of collateral circulation; (8) location of nerves (of importance because of excision of wounds). (b) *Wounds of special locations* (should have intensive study), e. g.: (1) Joints; (2) chest; (3) abdomen; (4) brain and spinal cord; (5) oral and neck surgery; (6) nerves. (c) *Amputations*: Form, site of election, especially after treatment. (d) *Fractures*. (e) *Burns and gas injury*.

3. If any further help can be given, communicate with this office, attention of the surgical division.

The following is a copy of a syllabus inclosed in the above letter and sent to the schools by the Surgeon General to aid in the teaching of the treatment of war wounds:¹⁴

THE TREATMENT OF WAR WOUNDS

(1) Arranged by the division of surgery, under authority of the Surgeon General, United States Army, for surgical teaching.

(2) In fighting pests apply antiseptic and protect wounds. Treat mortal complications only—do not scrub or explore.

(3) In front area: Don't suture wound! Don't scrub wound! Don't evacuate with tourniquet in place! Don't put on tight bandages! Don't probe!

(4) In front area: Do give antitetanic serum. Do arrest bleeding (a) by tying vessel, (b) by bandage over cone of gauze. N. B. Be sure circulation of limb is not cut off. Do apply splint to fractures without removing clothes.

(5) Antiseptics will cleanse wounds locally and control suppuration but will not affect bacteria after they have entered the circulation.

WOUND TREATMENT AT EVACUATION AND BASE HOSPITALS

(6) Exeision with foreign body removal and drainage when necessary are fundamental principles.

(7) If wound is excised within six hours immediate closure is often possible.

(8) Various other antiseptics have been used: Flavine, brilliant green, "Bipp," eusol, dichloramine-T., pierie acid, iodine, and many others.

(9) Eusol: A type of hypochlorous acid; is extensively used by the British. Probably less efficient than Dakin's solution.

(10) "Bipp"—Morison's method: Bismuth subnitrate, 1 ounce; iodoform, 2 ounces; paraffin, quantity sufficient to make paste. Excise and cleanse wound. Apply minimum amount "Bipp."

(11) "Bipp"—danger: Poisoning from bismuth or iodoform. Advantage: Little dressing of wound necessary.

(12) Hypertonic salt solution (Wright): Theory of use—osmosis from wound (lymphatic drainage), now little used by British.

(13) Flavine compound (Browning): Kills bacteria in wounds. Complete sterilization not so often secured. Fairly satisfactory but seems to inhibit repair after a time.

(14) Pierie acid: Five per cent pierie acid in alcohol—not so irritating as iodine and probably as efficient.

(15) *Closing of wounds.*—

First. Primary closing of a fresh wound after mechanical sterilization may be made if patient is afterwards closely watched.

Second. Secondary closing is made after mechanical and chemical sterilization and under bacteriological control. A wound may be sutured when surgical asepsis is obtained (1 bacterium per 5 fields).

(16) To-day suppuration of wounds can be surely prevented or stopped. There must be no pus in a hospital.

(17) Most of the amputations due to infection can be avoided.

(18) Septicemia generally can be prevented. The length of treatment of each wound can be reduced to one-third of what it is at present.

(19) These results can not be obtained without precise technique. No chemical substance has the power, by itself, to sterilize a wound, if proper surgical treatment is not applied.

(20) *Burns.*—Arranged by the division of surgery under authority of the Surgeon General, United States Army, for surgical teaching.

(21) Burns are treated by the following approved methods: Paraffin wax, open air, under bed tent, adhesive plaster, strapping, dichloramine-T.

(22) Do not scrub burns or apply antiseptics to them; scrubbing and antiseptics destroy essential epithelium.

(23) Fundamental principles underlying treatment of burns are: Asepsis, protection, conservation of epithelium, prevention and treatment of shock.

(24) Paraffin wax is combined with various ingredients and marketed under the trade names: Cerelene, ambrine, parresine, radintol, standlind, etc.

(25) Paraffin wax must be anhydrous. Guard against the boiling water of the water bath mixing with it.

(26) Paraffin wax is prepared acid free with or without addition of mild drugs.

(27) Paraffin wax should be solid when cold, and fluid at 140° F.; heating at 250° F. for 10 minutes renders aseptic.

(28) Paraffin wax furnishes favorable conditions for repair by acting mechanically as a protective.

(29) Burns of first degree should have open-air treatment. One application of paraffin or oil may be made at first dressing.

(30) Application by atomizer is safest and best method of avoiding pain. If brush is used wax must not be over 150° F.

(31) Puncture blebs. Preserve overlying epithelium. Dry thoroughly with gauze, pledgets, or dry air. Apply dressing rapidly while wax is liquid.

(32) Apply layer of wax, then layers of cotton and wax alternately. Avoid direct contact of cotton with burn, which causes pain in applying and removing. At subsequent dressings, wound may be washed with saline solution or weak antiseptic applied as spray; do not rub with cotton or gauze.

(33) Dressing changed once daily. Fetid odor is of no serious import and disappears rapidly under proper aseptic treatment.

(34) Clinical evidence of toxic absorption requires use of hot moist dressings (aseptic or antiseptic); do not use wax dressings under such circumstances.

(35) Burns in neighborhood of joints should be treated with the idea of preserving joint function. Beware of contractures.

(36) If large areas are denuded of epithelium, prevent scar tissue contraction by skin grafting.

(37) Burned fingers and toes will web permanently unless separated by gauze during healing.

(38) Burns may be treated by open method, exposed to air and protected only by gauze-covered wire frame.

(39) Treatment of burns by dichloramine-T.

The following syllabus of instruction in the standard methods for treating fractures was also sent to all the schools:¹⁵

The purpose of this course of instruction is to familiarize medical officers with standard methods in the treatment of fractures. It is intended that officers so trained will not only serve in the special fracture hospital, but in field, base, and general hospitals, and as regimental officers as well, so that a continuity in the methods for treating fractures can be maintained. By this means it is proposed to establish team work on the part of medical officers throughout the Army, in order that the wounded soldier will receive promptly the most efficient treatment, whether at the regimental aid station, the dressing station, the field hospital, the evacuation hospital, or the base hospital, as well as along the lines of transportation. The logical result of this cooperation will be to secure early recovery, lessen deformity, and reduce the number of soldiers permanently disabled to a minimum. It is realized that the exigencies of the service in the zone of the advance will frequently be such as to render the standard aids impracticable, but by indicating clearly the desideratum it is hoped that the difficulties in the field will act not so much as an obstacle, as a stimulus to the ingenuity of the medical officers.

Fractures in war are usually compound and will be much more prevalent than the simple, so that any treatment which considers merely the fracture and not the wound and the soldier would be quite ineffective. Consequently, the course of instruction will be initiated with a brief but thorough presentation of wounds, from a military standpoint, their causes, and their treatment. This will be followed by the course in standard methods for treating fractures proper. The instruction will be intensely practical in nature, consisting in the demonstration of the splints, their adaptability and application, and in clinics.

Causes and varieties of wounds:

1. Bullet wounds: (a) Shrapnel, (b) rifle, (c) pistol.
2. Shell wounds: (a) Shell fragments, (b) shell fuse, (c) hand grenade.
3. Bayonet wound, sword wound.
4. Burns.
5. Gas.
6. Varieties of wounds: (a) Abrasion, (b) contusion, (c) laceration, (d) puncture—complete or incomplete.

Condition of wounded men:

1. Hemorrhage, excessive (shock).
2. Exposure, wet, cold; hunger.
3. Shell shock.
4. Gas.
5. Visceral injury; abdominal, thoracic, and head.
6. Infection; pyogenic, tetanus, gas bacillus.
7. Suppuration.

Treatment:

General—

1. Water administered: (a) Mouth, (b) rectum, (c) hypodermoclysis, (d) intravenous, dangers.
2. Food and hot drinks.
3. Medication.

Local—

1. Wound antisepsis: (a) Excision, necrotic tissue; (b) wound cleansing; foreign body removal; (c) tincture of iodine, (d) Dakin-Carrel method, (e) dichloramin-T.
2. Hemorrhage: (a) Pressure by bandage, cautious; (b) packed, cautious; (c) tourniquet, cautious; (d) ligation of artery, cautious; (e) amputation, indications.
3. Dressings: (a) Dry antiseptic gauze, (b) suture; indications.
4. Infection: (a) Suppuration, (b) gangrene, (c) drainage.

Fractures (at the dressing station):

1. General treatment.
2. Wound antiseptic; 2 per cent iodine, superficial.
3. Wound cleansing.
4. Immobilization and extension methods—
 - I. Fractures of the upper extremity: (a) Simplest splint, arm to chest; (b) screen wire and wood splints; (c) if practicable, Thomas arm splint; elbow splint.
 - II. Fractures of the lower extremity: (a) Rifle down the side of leg with coat between legs, and then lashed together; (b) screen wire and wooden splints, (c) femur, Thomas knee splint for fracture of femur; in fracture of femur, the soldier once placed on litter is not to be removed therefrom.
 - III. Fracture of rib; immobilization.
 - IV. Fracture of pelvis, fixation; not removed from litter.
 - V. Joints.
5. Infection; special treatment: (a) Tetanus-serum, (b) Gas bacillus, seration; anti-toxin; (c) pyogenic.
6. Amputations, contraindications; indications.
7. Anesthesia.
8. Diagnosis tags. These must be kept up to date, particularly with fractures.

Transportation:

1. Cases sorted into transportable and nontransportable.
2. Maintenance of immobilization and extension, where practicable, methods. Not more than 12 hours should elapse without the splint being inspected by a surgeon, and necessary adjustments made.
3. Femur, special treatment for fractures of, in transit: Not to be removed from litter; Thomas knee splint inspected once every 12 hours.

Evacuation hospital, special fracture hospital, base hospital:

1. Early and adequate surgery.
2. Wound antisepsis.
3. Wound cleansing.
4. Conservation of fragments.

Evacuation hospital, special fracture hospital, base hospital—Continued.

5. Immobilization and extension; standard methods.

I. Fracture of upper extremity: (a) Humerus, (1) Jones humerus extension splint, (2) Jones abduction splint; (b) elbow splint, (c) radius and ulna, Jones forearm and wrist splint.

II. Fracture of lower extremity: (a) Femur, Thomas knee splint; Hodgen splint overhead suspension and extension from Balkan frame, or on special fracture bed; (b) tibia and fibula, Jones leg splint and Cabot splint.

III. Fracture of rib; immobilization.

IV. Fracture of pelvis; fixation; Bradford frame.

V. Joints; operative indications; foreign body removal; drainage.

6. Malunion and nonunion—caution—late tetanus and infection.

7. Infections; special treatment.

8. Operative treatment—indications for; standard methods.

9. Amputation; special.

10. Anesthesia; ether, drop method, chloroform; nitrous oxide; spinal, tropococaine.

11. Examinations, special methods: (a) Roentgen-ray, (b) bacteriological.

12. Massage and baking.

13. Hydrotherapy.

14. Curative workshop—reconstruction.

The number of officers given instruction by these institutions in these subjects up to the signing of the armistice was 1,195,¹⁶ exclusive of those given instruction at the Rockefeller Institute and at the Mayo Clinic.

As an example of the courses of instruction given at these institutions, an abstract of the history of the instruction given at Cornell University is presented.

CORNELL UNIVERSITY MEDICAL COLLEGE, NEW YORK CITY^e

The course of instruction in fractures and war surgery followed by Cornell University Medical College was planned to give a practical working knowledge of fractures and their complicating wounds as seen in military practice. With this in view, the first two weeks, and to a less extent the third week, were occupied for a considerable part of the time with the study of basic subjects, such as anatomy, chemistry, bacteriology, and pathology, an understanding of which was essential. These were taught entirely in the laboratories, and officers took an active part in the demonstrations. The balance of the time in these weeks, and the entire fourth week, was given over to clinical study in the hospital wards and operating room. In this way, the relation between the lectures and the laboratory work, on the one hand, and the practical application of facts thus studied to wounds and fractures, on the other hand, was presented throughout the course, and received more emphasis as the course advanced. It will be seen on examining the schedule of exercises that the entire course was based upon practical work, and that didactic instruction was minimized.

The college library, on the fourth floor of the college building, was open at all hours. It was well supplied with current and textbook literature on all the subjects discussed in the course. The library of the New York Academy of Medicine was open throughout the day and evening to all medical officers. Ample facilities were thus available for the necessary supplementary reading.

^e The statements of fact appearing herein are based on: "Cornell University Medical College Course of Instruction on Fractures and War Surgery for Officers of the Medical Reserve Corps." Copy on file, Historical Division, Surgeon General's Office.

CHEMISTRY

SUMMARY OF LECTURES AND LABORATORY DEMONSTRATIONS

1. Considerations of general properties, methods of use, mode of action, stability, etc., of the more common antiseptics.

The discussion includes:

a. Inorganic antiseptics:

Hydrogen peroxide.
Potassium permanganate.
Heavy metals—
Mercury.
Silver.
Halogens—
Iodine.
Hypochlorites.
Eupad.
Eusol.
Boric acid.

b. Organic antiseptics:

Alcohol.
Aldehydes—
Formaldehyde.
Paraform.
Halogen derivatives—
Iodoform.
Chloramine-T.
Dichloramine-T.
Phenols—
Carbolic acid.
Lysol.

2. Detailed consideration of recent halogen antiseptics, with special reference to Dakin's solution and the chloramine derivatives. The discussion includes common names of substances used, methods of preparation, calculations involved in correcting Dakin's solution,^f stability, products formed on decomposition, etc.

* * * * *

BACTERIOLOGY OF WOUND INFECTIONS

GENERAL CONSIDERATIONS

Influence of type of wound on infection.

Punctured, shattered, superficial, punched-out wound.

Probabilities of infection.

Sources of infection.

Direct—projectile, bayonet; material carried into wound; clothing, splinters, skin fragments, etc.

Indirect—earth and feces.

Subsequent infection.

Influence of dressings—(a) transmission of infection from skin; (b) on anaerobes.

Character of infection usually found; reasons.

Bacteriological analyses of clothing (chart).

New, soiled, and sterilized clothing.

Local mechanical conditions in wound affecting infection.

(a) Destruction of tissue; (b) interference with blood supply.

General body conditions affecting infection.

(a) Health; (b) age; (c) degenerative factors; (d) shock; (e) bleeding; (f) fatigue.

Physiological processes in wounds and effect on infection.

Differences in punctured and shattered types.

Influence of unaltered serum and lymph on bacteria.

Influence of altered serum and lymph on bacteria.

Influence of living and dead leucocytes on bacteria; on serum and lymph.

Influence of the presence of dead tissue.

(a) On growth of organisms; (b) on production of deleterious products.

^f At the time the course was given, Dakin's solution was prepared from bleaching powder, but a demonstration of its preparation from chlorine gas and also from common salt was included. A description of the preparation and action of this solution may be found in Vol. XI, pt. 2, p. 201 et seq., of this history.

Reaction that usually takes place in wounds.

Up to fifth hour, no reaction; microscopic findings.

Fifth to ninth hour, reaction begins; migrating elements; degeneration of injured tissues.

Ninth to twelfth hour, appearance of bacteria; anaerobes near bits of clothing.

Twelve hours, bacteria multiply and spread; some phagocytes appear; small amount of pus appears.

Twentieth to thirtieth hour, pus more abundant and fetid.

Forty-eight hours, anaerobes associated with aerobes.

Flora of wounds; stages (chart); types present in first stage.

General activities and dangers.

Distribution in wound; Wright's wet leech; streptococcus in wall.

Types of organisms taking part in chronic infections.

Persistence of anaerobic types; relation to dressings.

Relative unimportance of staphylococcus infection; source.

Contributing factors influencing type of infection.

Mechanical influence of oxygen and blood supply and food conditions; viability of tissues.

Symbiotic growth; anaerobic and facultative anaerobic putrefactive organisms.

Various pathogenic organisms; favorable and unfavorable effect.

Practical.

Methods of making films from wounds for bacteriological examination; stains employed and methods of staining.

Examination of stained films and methods of checking up the Carrel-Dakin treatment

B. AEROGENES CAPSULATUS (B. PERFRINGENS)

Group; occurrence in nature; faecal Bælinæa; morphological description.

Pathogenicity; causative relation to gas gangrene; charts and citations.

Food supply; dead tissue, muscle, glycogen; anaerobiosis.

Staining qualities in body and in cultures; capsule formation.

Spores; in feces and dirt; in wounds; in cultures; size, shape, position in bacterial body, and resistance.

Cultural description with exhibition of cultures.

Influence of foreign bodies in growth (cloth, metal).

Method of isolation (sources of error).

Symbiotic growth; charts and citations.

Production of poisonous products of growth; necessary factors; previous failures and Bull's method; effect of toxic products; local; general; on growth of organisms in tissue; antisera, Bull's; neutralizing value against toxic products; therapeutic value, prophylactic and curative; against toxic products; against growth of organisms; antisera, Weinberg.

Natural references of body against this organism.

Methods of increasing; active and passive immunization.

Logical methods of combating this infection.

Prophylactic; curative.

Practical: Staining and examination of materials from wounds and cultures.

B. MALIGNANT EDEMA (VIBRION SEPTIQUE)

Group; occurrence in nature; general description; pathogenicity; occurrence in gas gangrene; nature of lesions; food supply; anaerobiosis; staining qualities; motility, flagella; spores, size, shape, position in bacterial body, resistance; cultural description with exhibition of cultures; other organisms resembling; methods of differentiation.

Production of poisonous growth products; Bargue and Doli, Weinberg, Roux; nature and effect; production of putrefactive substances.

Antisera, Weinberg; symbiosis in war wounds.

Practical: Examination of films and hanging drop preparation.

B. TETANI

Group; general description; occurrence in war wounds; incidence.
 Morphology; staining qualities; motility, flagella; spores; pathogenicity; causation; presence without symptoms; retention in wounds over long periods; cryptogenic infections; effect of injection of washed spores.
 Cultural description with exhibition of cultures.
 Recognition in films; distinction from tetanuslike organisms.
 Toxin production; method.
 Toxin; strength; mode of action; path of entry; reasons for failure of cures with antisera.
 Antitoxin; use; methods; prophylactic; curative; chart of English results.
 Practical: Examination of films for recognition of; examination of films; of hanging drops for motility.

OTHER ORGANISMS PRESENT REQUIRING ANAEROBIC CONDITIONS

B. fallax of Weinberg. Short description; activities; percentage of incidence.
B. edematiens of Weinberg. Short description; activities; percentage of incidence.
Cocur jaune of Weinberg. Short description; activities; percentage of incidence.
B. sporogenes. Short description; activities; percentage of incidence.
Bacillus X of Fleming. Short description; activities.
Bacillus Y of Fleming. Short description; activities.
Bacillus "Hibler IX" of Robertson. Short description; activities.
 Anaerobic streptococcus.

STREPTOCOCCUS

Types of this organism causing infection.
Streptococcus hemolyticus.
Streptococcus viridans.
 Type causing wound infection; enterococcus; description.
 Special importance of streptococcus in wounds; growth in granulation tissue and unaltered serum.
 Types of primary and secondary infection caused by streptococcus.
 Pathogenicity of various types.
 Interrelationship; immunological—protective, agglutins.
 Morphological description.
 Capsulation.
 Staining qualities.
 Cultural description with exhibition of cultures.
 Products of streptococcal growth—toxins, hemolysins.
 Discussion of body defenses—bacteriolysins, opsonins.
 Immune sera.
 Use of vaccines; favorable and unfavorable conditions.
 Practical: Examination of films.

STAPHYLOCOCCUS

General description with habitat.
 Occurrence in nature.
 Relative importance.
 Varieties present in wounds; source.
 Relative pathogenicity of varieties.
 Pathogenicity.
 Cultural description with exhibition of cultures.
 Products of growth—hemolysins (soluble and fixed), leucocytic, leucase, gelatinase, proteolytic, depressing factors.
 Discussion of body defenses and use of vaccines.
 Practical: Examination of films.

GENERAL DISCUSSION OF OTHER ORGANISMS FOUND IN WOUNDS AND THEIR IMPORTANCE

Colon group.
 Proteus group.
 Pyocyaneus.
 Diphtheroids.

GENERAL RÉSUMÉ OF WHOLE SUBJECT OF WOUNDS

Discussion of sterilization of wounds—mechanical, physiological, chemical.
 Discussion of subject of disinfectants as applied to wounds, with exhibition tests.
 Practical: Examination of films to check Carrel-Dakin method.

PNEUMOCOCCUS

Group; morphology and staining reactions; pathogenicity; types with mortality statistics; types, recognition; technique, usual method, demonstration; technique, Mitchell method, demonstration; cultural reactions, exhibition; serum treatment.

MENINGOCOCCUS

(Same presentation as pneumococcus.)

COURSE IN PATHOLOGY OF BONES AND WOUND INFECTION

GENERAL DISEASES OF BONE

1. *Simple osteoporosis*.—(a) Best example is absorption of bone by cancer metastasis. Here bone is passively absorbed without cellular reaction, without cell ferment action, by pressure on bone, on vessels, and by local and general abstraction of nutriment. Spontaneous regression of cancer followed by spontaneous replacement of bone and healing of fractures. Gross and microscopic specimens.

(b) Simple osteoporosis also occurs as a spontaneous disease of adult bone without known cause; may be progressive, and local or universal. Cause, general malnutrition, or local disturbance of circulation.

(c) Osteoporosis occurs in various combinations in many other diseases of bone; e. g., tubercle. Gross and microscopic specimens.

Look out for preexistent osteoporosis in all adult subjects.

(d) Exhibition of humerus in case of universal extreme osteoporosis, practically no bone being left in skeleton. Senile marantic atrophy.

2. *Osteomalacia*.—Gestational; senile; infantile; local; universal; pure or associated with other bone changes.

Gross effects are softening, bending, deformities. Progressive, but with usual definite limit. Peculiar constitutional disturbance in nutrition of formed bone. General cause is failure of calcium metabolism in general malnutrition, to which contribute excessive demands of fetus, calcium deficiency in diet, and probably originally defective bone.

Microscopic: Soft, rounded bone trabeculae, deficient in calcium, basic staining, with strie of mucinous material, lacunar absorption. May be associated with much churning up of bone, new imperfect bone replacing old. Picture more or less specific.

3. *Osteitis fibrosa*.—Progressive disturbance of bone, with absorption and then excessive replacement by poorly ossified bone, with growth of soft, fibrous tissue throughout marrow. Tendency to form cysts in marrow.

Gross: Great thickening and softening of bone, which becomes chalky, cuts easily, bends, and breaks; skull first, long bones later; may be localized anywhere. Exhibition of three skulls.

Microscopic: Shows broad trabeculae of poorly ossified bone, some absorbing, others actively growing; may resemble osteomalacia; soft cellular, fibrous, vascular, marrow tissue; great reduction in red marrow; indirect sequels, bone cysts, benign giant cell sarcoma, fractures, and deformities.

4. *Rickets, congenital*.—Infantile forms. A constitutional nutritional disorder, with general anemia, and special defect of bone ossification, strictly connected with deficient calcium absorption and appropriation. Experimentally produced by calcium poor diet.

Gross: Overactivity of epiphyseal ends, with swelling of ends of bone, but poor ossification; pigeon breast; rosary; deformities; frequent unabsorbed islands of cartilage in marrow cavities; great irregularity of chalky ossification zones; exhibition of skeletons; anemia, marasmus, enteritis.

Microscopic: Overgrowth of cartilage with poor absorption; failure of periosteal bone; hyperemia.

5. *Syphilis, congenital*.—Interferes with growth of long bones; characteristic saw-tooth line of ossification; large liver, large spleen; early death of fetus, or dwarfing.

Acquired; necessity of requiring spirochaeta and not relying on Wassermann. In general affects periosteum and causes thickening of bone shaft and narrowing of medulla. Circumscribed areas of absorption may be associated, but less common. Exhibition of honeycombed skull. Look out for confusion with multiple myeloma. Often gives gummatous infiltration of muscles and soft parts. Exhibition of forearm, amputated for tubercle, which never thickens shaft.

Gummatous periostitis and osteitis not common, may result in much thickening and coarse honeycombing of entire shafts or of circumscribed portions of shaft; caries sicca; dry specimens.

Microscopic: Syphilitic granuloma, in periosteum, bone, or marrow; bone growth predominating over loss.

No excuse for amputating syphilitic limbs.

6. *Tubercle*.—Differs from lues in affecting chiefly joint surfaces and ends, always causing absorption, almost never growth; early involving soft parts, and giving much exudate, hyperemia, wide suppurating tracts and sinuses; very wide superficial skin invasion in late stages; hectic fever, anemia, emaciation; usually many tubercle bacilli in pus.

Microscopic: Typical; exhibition of gross specimens, wet and dry.

7. *Rheumatism, rheumatoid arthritis, gouty arthritis*.—All due to underlying metabolic disorder sometimes associated with low grade of bacterial (streptococcus) infection. Miscellaneous bacterial infections of low grade or chronic course may contribute.

All tend to produce chronic, progressive, productive periostitis about joints, with productive peri-arthritis. General results are absorption of joint surfaces, eburnation, osteophytes, stiffening of joints, partial ankylosis, complete ankylosis. Affects any or all joints of spine, chiefly large joints. Exhibition of gross specimens.

TUMORS OF BONE

Osteoma is comparatively rare, occurs chiefly in bones of skull, is of slow growth, and little present interest.

Exostoses occur at ends of long bones, show central core of cancellous tissue with marrow, are often covered with cartilage derived from joint surfaces, and slowly growing. Two gross specimens.

Osteophytes occur at ends of bones, along tendon and muscle insertions, are elongated, pointed, solid bone, and of inflammatory or traumatic origin.

Angioma occurs spontaneously, and follows trauma or fractures as a disturbance of healing process. Type cavernous. Two cases, one following trauma to head of humerus, giving massive enlargement, recurring once after curettage. One case spontaneous, in body of lumbar vertebra, causing absorption and collapse of spine with paraplegia.

Angioendothelioma.—A malignant, rapidly growing tumor arising in bone shaft or marrow cavity, absorbing bone and invading soft parts, with metastases. Not osteogenic. Structure resembles hypernephroma (adenocarcinoma of kidney), with blood spaces lined by high cylindrical cells with clear cytoplasm, and requiring separation from hypernephroma, by search for primary renal (or adrenal) tumor. Gross specimen from lower end of humerus.

Osteogenic sarcoma.—A specific disease of bone, always essentially the same, but occurring in three main gross forms:

1. Spindle cell, fibrous, or cellular periosteal sarcoma, shaft long preserved, grows to large size slowly, produces metastases, and is usually fatal. Several gross specimens, early and late.

2. *Telangiectatic osteogenic sarcoma*.—Very vascular, most vascular forms producing malignant bone aneurisms (gross specimen from humerus). Destroys shaft early, invades soft parts as vascular, cystic, pulsating tumor in which new bone is scanty but present. Rapid course, early metastases, practically always fatal. Operated on frequently after occurrence of pulmonary metastases. Always X ray the lungs. Ten gross specimens.

3. *Sclerosing osteogenic sarcoma* produces ivorylike bone filling marrow cavity and thickening shaft. Pure and very slow, but often associated with vascular or cellular sarcoma. Very malignant. Specimens.

Bone sarcoma affects chiefly ends of long bones arising centrally from epiphyseal line, and rather seldom invading joints. Specimens.

Metastases pass readily through blood vessels, enter lungs, and grow to large bulk. Two cases.

Benign giant cell sarcoma.—Medullary or central sarcoma or sareoid. A specific disease of bone marrow, usually associated and sequel of osteitis fibrosa, arising in cysts of this disease; often multiple, slow, without cachexia, never producing metastases; rarely breaking into joints. Absorbs bone shaft slowly but often steadily, sometimes with advancing bony capsule, which may crepitate. Structure shows typical cellular vascular granulation tissue in which are many large giant cells with very many small separate nuclei, quite different from giant cells of malignant sarcoma. This same structure may be acquired in the sinuses leading to malignant sarcoma. Treatment conservative. Gross and microscopic specimens.

Multiple myeloma.—A characteristic disease of bone marrow, consisting of a very mild or very malignant neoplastic growth of marrow cells. Usually chronic, multiple, with numerous perforating tumors of ribs, skull, sternum, spine, or long bones. Early signs are boring pains, X-ray picture, and Bence-Jones albuminuria.

Four main types.—(1) Plasma cell tumors. Typical plasma cells, usual show type may be mixed with myxoma. Prognosis bad. Two cases.

(2) Lymphocytoma. Small lymphocytes. May involve whole of long bone and be mistaken for very malignant "round-cell sarcoma." Case involving whole of humerus, recovering under X ray.

(3) Malignant large cell types. Large round cells, probably derivatives of granular leucocytes. Produces metastases and bulky tumors.

(4) Erythroblastoma. Rare. Small round cells with dense nuclei; malignant. Cells contain much or little hemoglobin. One case.

Myeloma thus varies widely in prognosis and should be distinguished from osteogenic sarcoma.

Exhibition of case developing three months after fracture of clavicle.

FRACTURES

Types.—Complete; green-stick; linear; chipping; perforation; impacted; comminuted. With dislocation. Determined by type of trauma and character of bone injured. Illustrative specimens.

Fate of fragments.—Favorable when periosteum, endosteum, and nutrition are intact. Bridges of periosteum may suffice. Usually necessary to remove all small loose fragments, leaving periosteum.

Fate of bone transplants.—Depends on age of subject. Most favorable when periosteum and endosteum are transferred. Bone and periosteum may suffice. Bone alone probably always absorbed. New vessels penetrate old Haversian canals and seem to keep alive the transplant, but there is nearly always gradual absorption and replacement by new bone.

Microscopic section (B. Brooks, A. S., 65, 66).

Healing of fracture.—Blood clot soon organized by fibroblasts and endothelium, forming a central cavity about ends which gradually shrinks in one to two weeks. General reactive process affects periosteal tissues, fascia, muscle over a wide area. Much new cartilage promptly laid down from all these sources, giving fusiform provisional callus. Extremely active growth of bone trabeculae throughout callus, with calcification and absorption of cartilage, giving definitive callus. Condensation of bony callus follows gradually, with firm

bone always somewhat excessive. Usually reopening of marrow cavity early filled with callus. Osteoporosis affects ends to variable, usually considerable degree, sometimes excessive with marked shortening.

Specimens illustrating excessive provisional callus at two weeks and later. Structure approaches that of osteogenic sarcoma.

Nonunion.—Chief cause is lack of osteogenic momentum, or excessive osteoporosis. Usually attended by failure to absorb cartilage which may remain surrounding a central cavity. Suppuration, common. Syphilis a rare factor. Wide stripping of periosteum may figure. Results: Fibrous union, or no union, or pseudoarthrosis. Dry specimens of each. Inclusion of muscle, or nerves may occur.

Complications of fractures.—Injury to muscles—widespread in military work. Forward, wavy, spiral movement of high-velocity projectiles. Wide contusion and killing of tissues due to hydraulic laws. Wide dissemination of fragments. Necessary to remove all loose fragments and all contused tissue in which circulation fails.

Injury to nerves and brain, a special topic.

Injury to vessels; arteries highly resistant. Rupture leads to gangrene. Partial integrity followed by thrombosis, secondary sloughing, and hemorrhage. Traumatic aneurism.

Infection.—Practically constant in compound fractures; bacterial content of clothing and dirt; open treatment; importance of blood masses; course of hemorrhage along fasciæ and within muscle sheaths; effects of suppurative osteomyelitis, with involucrum about old fractures (many specimens). Dead bone as harbinger of bacteria. (K. Taylor, A. S., 66, 522.)

ACUTE INFECTIOUS PERIOSTITIS, OSTEOMYELITIS, AND OSTEITIS

Modes of infection.—(a) Metastatic from abscess in distant area, during septicemic, infectious diseases, scarlet, variola, typhoid, etc.; (b) pyemic, from septic emboli; (c) direct infection, in compound fractures.

Bacteria.—Staphylococcus, commonest agent; produces abundant suppuration; tends to involve whole of marrow with large sequestra. Streptococcus, tends to affect epiphyses and joints, or periosteum, with less pus, and more necrosis. Typhoid gives late, localized cortical infection, little pus, seldom bulky sequestra.

Blood supply of long bones.—Three groups: Epiphyseal, from joint vessels; metaphyseal, from periosteum supplying ends of shafts (these two sets are end arteries); central nutrient artery supplying most of shaft. Experimental osteomyelitis shows dominance of these sets of vessels.

Gross pathology.—(a) Periostitis: Serous, fibrinous, or phlegmonous exudate gathers between bone and periosteum, strips up periosteum for short distance, gives localized abscess, and superficial necrosis of bone. Or entire shaft is affected with soft parts with fatal pyemia. Or marrow is penetrated through Haversian canals, marrow filled with localized or diffuse purulent exudate, leading to total necrosis of shaft. Pus beneath periosteum usually means pus in marrow cavity and calls for opening marrow.

(b) Osteomyelitis: Infection begins in marrow, extends variable distance, giving local abscess or diffuse suppuration. Necrosis follows when blood supply fails over a segment of bone, and always involves whole of bone.

Sequels, sequestrum formation, involucrum formation, death from pyemia, etc., or restitution.

Sequestrum: Hard, white, bathed in pus; undergoes some absorption; may be completely absorbed, but suppuration continues as long as sequestrum remains. Bacteria protected and persist in dead bone. Sequestrum may involve any portion of shaft, or whole long bone and both joint surfaces. (Specimens.)

Involucrum forms most freely in suppurative periostitis, may be bulky, very thick, spongy, condensing after recovery from infection, often riddled with cloacæ. Remarkably extensive examples of involucrum may form, covering whole of shaft of femur and both joint surfaces (specimen); or whole of inferior maxilla in phosphorus necrosis (specimen).

Demonstrations of dry bones specimens of fractures.—Simple without reaction; transverse, oblique, splintered, green-stick, comminuted, impacted. Thirty specimens.

Infected fractures with suppuration, large and small. Complete necrosis of entire shaft with involucrum. Three specimens.

Simple fractures healed, in various positions. Femur, 10; forearm, one or both bones; Colles, with dislocation at elbow; vertebrae; clavicle, one or both; sternum; humerus; one or both bones of leg; foot; pelvis; ribs; skull; etc. Numerous rarer forms of fractures and healing.

Nonunion with osteoporosis. Fibrous union. Pseudarthrosis.

Moist specimens with analysis. Effects on skin, subcutaneous hemorrhage.

Muscles, crushing, infiltrating hemorrhage throughout sheaths.

State of blood vessels, tearing, thrombosis, gangrene, secondary hemorrhage. Hemolysis in museles, and inclosed blood clots.

State of bone and bone marrow. Fate of nerve trunks.

Course of infection as determined by course of hemorrhage, and injury to soft parts, with special reference to gas gangrene.

Treatment of fractures (Le Riche).—Urges thorough cleaning away of all broken fragments, and extreme care in preserving periosteum. (1) In young subjects, if one removes bone, but leaves periosteum, it will always produce enough bone to fill defect. (2) In subjects past growth period (22 to 23), periosteum gradually loses activity, but under trauma, violent, or repeated slight, or infection, it regains power of producing bone. The regeneration from periosteum is then slightly less than the bone removed if operation is subperiosteal; it is poor and insufficient if operation is incompletely subperiosteal; it is nil if operation is extraperiosteal. In infected fractures, two to four days old, subperiosteal esquillectomy is always followed by admirable reproduction of bone after control of infection. Extreme care with fine instruments, avoiding trauma, is secret of success.

Most war fractures are infected. Few infections where there are no muscles. Injury to muscle is widespread from concussion and thrombosis of vessels. Swollen museles close wound of entrance and retain broken-down tissue, while excluding air and circulation.

In infected fractures, all loose fragments die. Attached fragments usually harbor bacteria, become source of continuous infection and seat of inflammation, and eventually die. In mild infection, marrow is destroyed for short distance and becomes clear to X ray. In bad infection, marrow destroyed to ends of bone or even into joints. Extensive sequestrums result. Thorough drainage necessary. Removal of all dead bone, recognized by white color and increased density. Dead bone may consist of outer shell or splinter involving only portion of shaft, or whole thickness of shaft, or whole bone.

Complications of fracture and accompanying injuries.—Fat embolism: Comparatively frequent occurrence, after fractures of long bones involving fluidification of marrow, crushing of fat tissues. After clean operations, sometimes trivial, on fat subjects, as breast of hernia, etc. Pathogenesis. Fluid fat drawn in venous channels reaches pulmonary capillaries and arterioles, fails to pass, and causes obstruction of blood flow. Right heart distended, pressure high. Symptoms of dyspnea rapidly increasing, cyanosis, labored pulse, coma. Fat may be forced through lungs and lodge in brain and other organs, giving intense capillary congestion with agglutination thrombi with appropriate symptoms. Minor grades of fat embolism, not fatal, probably common. Not to be confused with shock, in which the patient bleeds into his own veins and capillaries, and blood pressure in right heart is low. In fat embolism, patient dies from asphyxia.

Case report after fracture of tibia. Experimental lesions in dogs receiving olive oil. Gross and microscopic demonstrations from each.

Pulmonary embolism.—Thrombosis of veins, especially varicose veins, superficial or deep, occurs spontaneously or after injury. Thrombus extends into some large vein, as femoral, and eventually end breaks off and is carried to lungs, lodging in large pulmonary artery. Here it may cause rapid death, or, death being delayed, it may set up local thrombosis, clot ramifying to variable extent in pulmonary vessels. Infarction fails in rapidly fatal cases, but may occur and be followed by pneumonia. Anatomical diagnosis requires demonstration of broken end of original thrombus, loose embolus in pulmonary artery. Death by asphyxia.

Case report and gross specimens of pulmonary embolus from slight injury of calf, with varicose veins and Hebrews' disease.

Shell shock.—Best to assume anatomical lesions and not to attribute condition to nervousness. Concussion from shell explosion often sufficient to produce miliary hemor-

rhages in brain substance. Mott has found such lesions in brains of shell shock. Lesser lesions on fine nerve fibrils and gemmules, or nerve cells may reasonably be postulated. Many cases complicated with CO poisoning. Exhibition of Mott's findings.

WOUND INFECTION

GENERAL

Types of reaction.—(1) All pyogenic bacteria produce leucocytic exudate and simple suppurative inflammation of varying extent, bacteria remaining on superficial layers of cells. All produce and heal by granulation tissue, and leave scars.

Grades of reaction.—(a) Catarrhal inflammation: Occurs on wound surfaces, mucous and serous membranes, and in organs and tissues. Lymph nodes, kidney, joints. Essential features are exudation thrown out on a surface and exfoliation of lining cells. Exudate may be serum fibrin, blood, or pus. Little or no interstitial exudate. Complete healing usually follows.

(b) Phlegmonous inflammation: Exudative process with very rich, diffuse, leucocytic infiltration. Leaves deposit of mucin in tissues and stiffening may lead to pus pockets.

(c) Necrotic inflammation: Characterized by death of tissue from pressure of exudate or necrotic action of bacteria. On surfaces produces ulcer; in closed tissues abscesses. Always leaves permanent changes in tissue.

(d) Diphtheritic inflammation: Characterized by widespread and superficial necrosis from bacterial toxins. May affect surfaces or deeper tissues. Usually streptococcus or Klebs-Loeffler bacillus. Leaves ulcers, abscesses, scars, deformities.

(e) Gangrenous inflammation: Death of tissue in bulk, from thrombosis of vessels, large or small, and secondary putrefactive changes, with foul odor. Necrotizing action of bacterial toxins may be prominent. Moist gangrene.

(f) Septicemia: Much or little local reaction fails to stop entrance of bacteria to blood stream and bacteria circulate and grow in blood.

(g) Sepsimia: Absorption of products of tissue decomposition, with or without bacteria. Retained secundines.

(h) Pyemia: Multiple abscesses from emboli of infected blood clot of bacterial colonies. Usually from infected thrombophlebitis.

(i) Syntoxic parasitism: Absorption of aggressins, together with their specific bacteria, produces great increase in virulence of infection, increasing invasive properties by paralysis of leucocytes, proliferative properties, and toxicity of bacteria.

(j) Aggressins are specific substances developed by bacteria growing in living tissues, which paralyze leucocytes and facilitate growth invasion and toxicity of bacteria.

Sources of intoxication.—(a) Diffusible toxins: Specific poisonous ferments readily diffusing from bacteria in cultures and tissues, acting on nerve cells (tetanus), or on local tissue cells (diphtheria), or both, producing characteristic symptoms.

(b) Endotoxins: Less specific or nonspecific poisonous proteins derived from bacterial cell bodies upon their solution in body fluids, acting chiefly on nervous system, also on most organ cells, producing nonspecific symptoms very similar in all infectious diseases. Diffusible toxins produce antibodies and immunity endotoxins do not.

(c) Hemolysins, nonspecific blood-dissolving substances, of complex origin and nature, derived from toxins, endotoxins, and products of tissue change, e. g., streptococcus, *Bacilli aerogenes*. S. P. A.

(d) Toxic products of tissue change, generally repelling leucocytes, derived by various changes in splitting of protein molecule and fats. Ptoamines, very toxic alkaloids, as cholin, cadaverin. Nitrogenous bases, as leucin, tyrosin. Fatty acids, lactic, formic, butyric. Aromatic products, as indol, phenol. Simple chemicals, NH_3 , H_2S , CO_2 , H_2 . Most of these may probably be reduced by cleansing surface of wounds and removing dead or infected tissue. *Bacilli edematis maligni* produces an ammonia salt of a fatty acid which is extremely toxic. (Barger, Dale, Lancet, 1917.)

Sources of defense.—Main source of defense in all wound infections is polynuclear leucocyte. Significance of leucocytosis, local, general. Mode of action of leucocytes is by phagocytosis. Extracellular destruction of bacteria in acute pyogenic infection is quite

subordinate. Mechanical, flushing of wound by serum, and pus carries off surface bacteria. Fibrin membrane entangles and inhibits entrance of surface bacteria. Mucus generally antagonistic to bacterial growth and movement. Endothelial cells are actively phagocytic at most stages, especially later phases. Chief period of spread of bacteria is in early stages before capillaries become filled with leucocytes. Too great congestion not favorable to emigration of leucocytes, while stasis in vessels completely inhibits leucocytosis. Granulation tissue a specially effective barrier on account of its active circulation bringing abundance of actively emigrating leucocytes. Clotting blood is a strong antiseptic, while hemolyzed blood greatly favors growth of bacteria, and produces intoxication, and should be removed. Any agent injuring or inhibiting granulation tissue or procedure involving its removal is to be avoided. Postoperative "flares."

Action of local antiseptics.—No local antiseptic can penetrate inflamed tissues in bactericidal strength without damaging natural defenses. Their action, if favorable, must be the removal of surface bacteria and accumulated material which is favorable to growth of bacteria on surface and to formation of toxic products of tissue decomposition. They may also carry in oxygen and relieve anaerobic conditions. They may act as chemotactic agents drawing more leucocytes to surface. Their administration may call for more detailed general attention to wound and patient and thus relieve some unfavorable conditions commonly existing about neglected wounds. They act as mental stimulus to patient and physician. They fail with true tissue parasites like bac. tuberculosis.

Gangrene.—Always involves closure of vessels, usually of large vessels, by any means, usually thrombosis, or endarteritis, possibly only by spasm, rarely by pressure.

Dry gangrene, unattended by spreading infection or exudate, and secondary to arterial occlusion.

Moist gangrene, an acute infectious process resulting in gangrene simultaneous with occlusion of vessels.

Senile gangrene, toes, feet, fingers. Follows arterial sclerosis. Gross and microscopic specimens showing lesion in vessels.

Thromboangiitis obliterans: Erythromelalgia. Hebrews' disease. Specific course with pain from neuritis, erythema, and other vasomotor disturbances, and gangrene of extremities. Progressive. Specimens showing gross and microscopic lesions.

Gangrene from crushing injury, severing main artery, or causing thrombosis. May be immediate or delayed. Gross specimens.

Gaseous gangrene, specific, usually mixed, infection of wound, to be considered later. Specimens.

Diabetic gangrene, perforating ulcer of foot. Severe exudative inflammation of pyogenic type in specially susceptible tissues.

Spontaneous gangrene: Aeroesthesia. No demonstrable lesion occluding vessel. Case history and specimen of leg.

Gangrene of frost bite and trench foot: Occurs only after vessels have become occluded by thrombosis (very rapid cases), or obliterating endarteritis which may develop within a few days of exposure. Effects of cold include edema, serous exudation, venous stasis with vasomotor paralysis, followed by very active proliferation of fixed tissue cells. Illustrative section from frost gangrene of toe, showing endarteritis, productive neuritis, and great cellular overgrowth.

Streptococcus is the main bacterium. Many clinical types.

Erysipelas.—Usual form is a superficial, rapidly spreading infection of subepithelial lymphatics, hyperemia giving erythema. Chills, fever, intoxication, occasional bacteremia, local or general, single attack or recurrent, slight exudation, no permanent changes.

Or erysipelas may be subcutaneous, with or without cutaneous erythema, and then it is usually more severe. Exudate may then be slight and serous, or phlegmonous (many polynuclears), or diphtheritic. Bacteremia common, septicemia may occur, often fatal. These types occur with gas gangrene, hospital gangrene, etc.

Local cellulitis with lymphangitis: Common type of streptococcus infection. Early involvement of lymphatic nodes which require excision if purulent.

Superficial diphtheritic inflammation of open wounds usually caused by streptococcus: Surface covered by whitish or gray membrane, coherent and opaque if mixed with fibrin. True diphtheria of wounds also occurs.

Streptococcus tends to produce relatively little pus, extends rapidly through lymphatics rather than blood vessels, produces more intoxication than local reaction, and often lodges in serous membranes (joints), and leads to septicemia, not pyemia. Local process often diphtheritic. *Staphylococcus* produces much local reaction, much pus, seldom diphtheritic lesions, invades local vessels with infected thrombi, giving pyemia.

Tetanus.—All soil, and most foreign materials, contain *Bacilli tetani*. Hence wounds must be made unfavorable for anaerobic growth. Tetanus develops in slightly punctured, or deep penetrating, or widely lacerated wounds, where virus is protected from air. May appear at once, or weeks after wound is healed. Very slight or no noticeable local reaction. Bacteria remain localized, or travel up nerve sheaths. Symptoms due to diffusible toxin. Appearing after 12 days, prognosis favorable. Prophylactic antitoxin regularly indicated. One of the chief grounds for wide-open treatment of wounds.

Gas gangrene.—An old and well-known wound infection, very common and fatal in early days of the war; now less common and rather effectively handled by open treatment and early and thorough removal of dead tissues and blood clot. *B. aerogenes* grows vigorously when there is food for it, but disappears when there is nothing to feed upon.

Two main factors determine incidence in civil practice, fecal contamination and watery blood. Specimens. Abortion. Transfusion of infected stale saline. Terminal anemias.

Sources: Constant in feces. A saprophyte of nearly universal distribution. Samples of fresh Belgian uniform fabrics constantly infected.

Clinical types: General character of that of infective sapremia, or syntoxic parasitism. (1) Bronzed erysipelas. (2) Subcutaneous and fascial. (3) General involvement of muscles. (4) Infection of isolated muscles. (5) Delayed or latent forms, excited by operations on old wounds. (6) Metastatic. Developing in distant parts not affected by wound. (7) Septicemic. Sometimes in fulminant cases, more often a terminal invasion in anemic subject. (8) Toxic. Intoxication out of line with local lesion. (Probably mixed infection.) (9) Benign. Favorable course, with little general reaction. May be found in simple pleurisy. (10) Gaseous and nongaseous forms.

Course: Peracute; acute; chronic.

Development of lesion: (a) Preparatory—main factor is injury of muscles, direct or from splinters of bone, or from shutting off blood supply; equally important is blood clot, especially haemolyzed blood. Intramuscular hemorrhage balloons out the muscles from end to end and occludes vessels. (b) Infection—cadaveric rigidity said to mark line of advance in infected muscle, a true coagulation of myosinogen. Serous exudate abundant precedes leucocytes. Rich and effective leucocyte exudate in favorable cases, little in bad cases. Gas infiltration often splits up tissues and facilitates spread of bacteria. Yet in dead rabbit muscle bacillus travels in muscle planes 2 cm. in 24 hours. Thrombosis of vessels sets in promptly and favors growth of bacilli. Hemolysis proceeds rapidly and destroys protective power of blood. Necrosis of muscle results from infarction. (c) Putrefaction—secondary changes a complex process, many bacteria being usually concerned. Muscles dark red when first infected, later change to yellowish brown or chocolate black. Fibers homogeneous, then fragmented, swollen, disintegrated, giving rise to many toxic products of tissue change, of which little is known.

Biochemistry: (Henry, *B. M. J.*, 1917, i, 806.) First stage.—Active growth in muscles due to abundance of glycogen which is split by saccharolytic action of *B. aerogenes*. Glycogen converted into lactose and maltose, these again into acids and gas. Gases are CO₂ and H₂. Excess acids tend to limit growth of bacillus, but these are neutralized by alkaline fluids and blood. Wright's treatment by intravenous sodium bicarbonate designed to limit supposed acidosis, not very effective.

Second stage—acid formation succeeded by proteolytic action which dissolves muscle and yields ammonia compounds. H₂S is given off and muscles darken. In this stage, more severe systematic intoxication appears. In acid stage, muscles are brick red.

Treatment: Principles suggested by known pathology of diseases are thorough removal of bacterial nutriment, contused muscles, dissecting out muscles infiltrated with blood, removal of blood clot, cleaning out bone fragments and all foreign material. Maintenance of circulation. Blood transfer for anemia. Oxygen. No evidence appears of true toxin pro-

duction, but reports of serum treatment, theories to contrary, are encouraging, and should be watched with caution. Bacteriology of disease is usually complex and involves bacteria for which no immunity has thus far been produced for man; e. g., streptococcus, endotoxins, tissue products, ptomaines, ammonia compounds.

Results of serum treatment: (Weinberg, *Royal Soc.*, July, 1916).—Three sera from *B. perfringens*, *B. edematiens malignans*, and *Vibrio septique* gave immediate good effects in 10 of 15 cases. In 5 septicemic cases, there was no benefit. Thinks antitoxic sera will have better preventive than curative effect against *B. edematiens malignans* and *Vibrio septique*. These toxins rapidly combine with nervous tissue in one hour. Recommends immediate injections in and about wound of three mixed sera, then, from results of bacterial culture, choose the one most indicated.

ANATOMY OF THE EXTREMITIES, WITH SPECIAL REFERENCE TO THE STRUCTURES INVOLVED IN FRACTURES AND DISLOCATIONS

This course consists of six demonstration conferences, during which a very extensive collection of fractured bones and old joint dislocations, ankyloses, and dissections of muscles about bent and stiff joints are examined. Dissections of the joints and soft parts of the limbs, as well as models and charts, are used extensively.

First lecture.—The muscular and bony attachments of the arm to the neck and trunk. It is brought out, by means of models and specimens, that the arm is chiefly held to the body by extensive muscular attachments. Posteriorly, these muscular attachments begin at the occipital bone of the skull by means of the trapezius muscle and extend throughout the length of the vertebral column, and finally through the latissimus dorsi the arm is actually attached to the posterior part of the iliac crest or the girdle of the lower extremity. The arm posteriorly is held to the body by means of muscle attachments from the head to the sacrum. Anteriorly the muscular connection is much less extensive, yet, by means of the omohyoid, it begins at the hyoid bone and extends through the pectoralis major and other muscles to the breastbone and ribs. The numerous muscles, all of which are demonstrated, hold the arm by means of insertion into the arm girdle, the clavicle and scapula, as well as by insertion into the humerus or arm bone itself. The toughness, or strength, of these muscles is responsible for holding the arm to the trunk against violent pulls and forces, tending to tear it away. Should these muscles be broken or ripped away, the only bony or joint connection between the arm and the trunk is the small sterno-clavicular articulation. This joint owes its strength solely to its capsular ligament. The possible injuries and dislocations of this joint are considered.

The fractures of the clavicle are then considered. The parts of the bone more likely to be broken are pointed out, and in every case a consideration of the muscle pull on the broken parts is gone into. The possible injuries of the soft parts, such as the nerves and vessels that lie beneath the bone, are discussed and the exact position of these structures is shown on the specimens. The valuable rôle of the subclavian muscle is recognized as often protecting the large subclavian artery and vein, as well as the brachial plexus of nerves, all passing between the clavicle and the first rib.

The joint between the clavicle and scapula is briefly described and shown with specimens. Fractures of the scapula are demonstrated, and the resulting derangement of muscle pull and muscle positions are analyzed.

Dislocations of the shoulder joint: The most common dislocation of this joint are taken up in their order of frequency. The muscles, passing from the scapula to the tubercles of the humerus, are described as holding the head of the humerus close into the glenoid fossa of the scapula. In all dislocations some of the muscles are stretched or torn, and it is demonstrated which muscles are affected in shoulder dislocations passing in given directions. The mechanics of the joint, its freedom of movement and strength in different positions, are reviewed. The relationships of large vessels and nerves in the shoulder and axillary regions are fully demonstrated.

Second lecture.—The arm, as a whole, is divided into ventral and dorsal surfaces, separated by preaxial and postaxial borders. On this basis the muscles may be grouped according to their positions and actions. The muscles of the ventral surface being flexors, those of the

dorsal surface very largely extensors. The arrangement of the cutaneous nerves, and also the innervation of the muscles, may be simply analyzed in connection with these surfaces and borders. The muscles are thus treated in functional groups, and their innervation corresponds with the group arrangement. This view of the subject enables the surgeon to understand and to know the muscles and nerves without attempting to burden his memory with the details of anatomy. The complexities of given movements are briefly considered so as to show the various muscle groups involved in performing a certain action of the arm. By the use of these analyses, it is shown how paralysis of certain muscles and fractures at different places in a bone might be diagnosed.

The humerus is studied in regard to the strength of the bone in its various parts, and the attachments of muscles were found to correspond with certain changes in strength in the different parts of the bone. The upper epiphysis is considered from the standpoint of possible epiphyseal fractures in young men, and the pull of the scapular muscles on the tubercles as part of the epiphysis is pointed out. A large collection of humeri that had been fractured in various places during life are shown, and the displacement and shortening of the bone is explained from the standpoint of the direction and force of muscular pull on the parts of these specimens. The relationships of the large nerves and vessels of the arm to the bone are reviewed, with special reference to the most favorable points for compressing the brachial artery against the humerus.

The regional anatomy of the elbow joint is discussed, after which a full consideration of dislocations and fractures in the region of this joint is undertaken. A number of old fractured and ankylosed elbow joints are demonstrated. The movement of the forearm on the upper arm at this joint is analyzed from a mechanical standpoint. The obtuse (carrying) angle formed between the upper and forearm is shown; and the significance of this bend, on the line of pull is demonstrated.

Third lecture.—The forearm and hand: The movements of pronation and supination are analyzed; and the general relationships between the radius and ulna are shown in the various phases of these movements. The arrangement of the muscles on the radius and ulna and the influence of these muscles on the fragments resulting from fractures of the radius and ulna are discussed. The arteries and nerves of the forearm are demonstrated in their relationships to the muscles and bones. Fractures and dislocations of the wrist and carpal joints are discussed, and a number of specimens showing fractures of these regions are demonstrated. The fascial compartments and tendon sheaths in the hands and wrists are reviewed in connection with possible distribution of infections, etc., in the fingers and hand. The general anatomy of the vessels and nerves, tendons and muscles in the hand are briefly summarized and the useful landmarks and method of locating the internal structures are pointed out.

Fourth lecture.—The support of the trunk on the pelvic girdle: The strong and close connection of the trunk with the pelvic girdle is contrasted with the loose muscular attachment of the pectoral girdle to the trunk, which was considered in the first lecture. The regional anatomy of the pelvic girdle is briefly reviewed. The main and tie arches of the girdle are then considered. The femoro-sacral, or standing arch, and its tie arch are discussed in connection with certain fractures and the strength of the pelvic girdle in general. The ischio-sacral, or sitting arch, and its tie arch are considered in a similar manner, and dislocation which might occur in the pelvic girdle are then briefly reviewed.

The mechanics and strength of the hip joint are analyzed with the view of more fully understanding the conditions following the different dislocations of this joint. With ligament preparations, it is shown what positions the head of the femur would occupy in the several hip joint dislocations. In each case the muscles that may be stretched and torn are discussed. The ligaments of the capsule are described in connection with their behavior in the various dislocations, and the uses of these various ligaments and muscles in reducing the dislocation are described.

A large number of specimens are then used to demonstrate various fractures of the neck and upper parts of the femur. The collection available for this purpose is extensive and extremely elucidating in a consideration of the various compacted conditions of the head of the femur, resulting from severe injuries to the hip joint.

Fifth lecture.—The thigh and knee: The thigh and leg, as a whole, are divided into ventral and dorsal surfaces, separated by pre and post axial borders, as was done in the case of the arm. The thigh and leg, however, have been rotated to such a degree in development that their dorsal surfaces are forward or toward the ventral surface of the trunk. Keeping this in mind, the muscles of the thigh and leg may be arranged in functional groups similar to those of the arm, the extensor muscles being found on the front or dorsal surface of the limb, and the flexor muscles are on the ventral surface of the limb which is toward the back of the body. The distribution of the cutaneous nerves is also rendered simple by this division of the limb into surfaces. The innervation of the muscle groups here again as in the arm makes it possible for the surgeon to understand their function and arrangement without depending upon the details of anatomy. A large collection of fractured femurs are shown, and the line of union between the two fragments indicates the direction of muscular pull which has been exerted on the lower fragment. The places on the femur most frequently fractured and the muscle pulls on the fragments during various degrees of flexion at the knee are pointed out.

The regional anatomy of the knee joint is briefly reviewed, with a careful consideration of the synovial cavities of the joint and the neighboring tendon sheaths and bursæ. Dislocations of the knee joint are then discussed from an anatomical standpoint.

Sixth lecture.—The leg and foot: The general anatomy of the leg and foot is briefly reviewed on dissected specimens. Fractures of the tibia and fibula are demonstrated with a considerable number of these fractured bones, and the displacement of the fragments is discussed in the light of the muscle pulls involved.

The ankle and tarsal joints are reviewed and the dislocations and fractures of these joints and bones considered.

The arches of the foot are carefully analyzed and the conditions of fallen arch and flat foot thoroughly discussed from the anatomical standpoint. The competition between the tibialis and peroneus muscles is discussed in connection with the normal position and direction of the foot in standing and walking.

The tendon sheaths and fascial compartments of the foot are described in connection with their importance as influencing the distribution of infections, etc. The general arrangements of the vessels and nerves and the relationships of the tendons and bones in the ankle and foot are demonstrated on dissected specimens. Finally, the foot is considered from a mechanical standpoint, as the pedestal or basis on which the body must stand and move.

SYLLABUS OF THE COURSE OF INSTRUCTION GIVEN IN BELLEVUE HOSPITAL

The object of this course is twofold: (1) The practical treatment of fractures; (2) the practical treatment of infection.

1. Instruction is given in the principles, the structure and the application of the standard splints adopted by the United States Army. In this work the officers are required to become entirely familiar with the various splints and their uses. In order that they may practically learn those factors which tend to comfort or discomfort on the part of the patient, the first instruction is carried on with some of their own number acting as patients. Later they used uninjured patients in the wards and finally apply the splints and various apparatus to patients whose injuries demand their use for therapeutic reasons. The service affords from 30 to 40 such patients for each class. This work includes the setting up of the Balkan frame, and using it as a means of putting into effect the principles of suspension and traction in compound fractures of both the upper and lower extremities. This work is closely supervised, and is accompanied by lectures based on the work of Silver, Flint, Blake, Jones, and LeRiche.

2. Instruction was given in the operating rooms and wards in the practical lessons which military surgery has taught in the treatment of both contaminated and suppurating wounds of the soft tissues and bones. Emphasis is laid throughout upon the principles which are coincidentally being taught in the laboratory courses, in anatomy, chemistry, bacteriology, and pathology. Necessarily, there is some variation in this part of the work with different classes, because of the variation in clinical material in the wards, but in general the same plan is followed. The purpose of this plan is to demonstrate those facts in treatment which all authors agree the war has proved.

(a) Severe contaminated wounds may be rendered clean if proper attention is paid to the elimination of all foreign matter, including that resulting from blood and tissues which have been damaged beyond hope of repair. Attention is given to the mechanical and chemical cleansing of the wound within the first six or eight hours. The teachings of Moynihan, Carrel and Dakin, Wright, Depage, Tuffier, Blake, Dunham, Le Compte, Lee and Furness, and others are followed in this. For this purpose all proper traumatic cases are operated upon before the class, particular attention being given to the principles involved.

(b) Badly infected and suppurating wounds may be rendered surgically clean by proper application of the above principles, associated with the use of physiological and chemical antiseptics. In teaching this phase of the subject, intensive instruction is given in the technique of using Carrel tubes, the dichloramine-T-oil spray, and the principles underlying the use of the Wright hypertonic salt solution and salt pack. The officers are permitted to do the actual dressings in this part of the work, and insistence is laid upon correct technique in each step.

(c) Wounds thus rendered surgically clean may be sutured or grafted, and the period of convalescence much shortened by this means. In this work the officers study the bacterial count and determine when the suturing shall be done. They then witness the latter and follow the results. Throughout this course the endeavor is made to emphasize the underlying principles of pathology and bacteriology which control wound healing, with the practical technical application of therapeutic measures which tend to overcome those factors that lead to continued disability. The object to be attained is the most prompt return of the wounded man to the most nearly normal condition possible. Further instruction is given along these lines by Captain Butler in the demonstrating room and by didactic lectures.

Another phase of the course has to do with the treatment of burns. The service furnishes a large material for this subject, and the officers are taught the use of the dichloramine-T oil, the paraffin compounds, the hot-air treatment, and the comparative value of the alkaline and the acid dressings. For the latter, an unpublished method is used. The surface of the burn is first covered with one layer of coarse gauze impregnated with the vaseline-resin-paraffin (see under Carrel treatment), used to protect the skin against sodium hypochlorite solution, and over this is applied a gauze dressing continuously wet with a 0.5 per cent solution of acetic acid. This results in a very prompt digestion of all necrotic tissue, and the establishment of healthy, clean granulations. If kept thoroughly wet, the dressing causes very little pain, and by many patients is pronounced more comfortable than any other form of treatment. The vaseline gauze permits the daily change of dressing without damage to epithelial islands. But two precautions are necessary; the vaseline gauze must be coarse mesh, about 16 by 20, must be applied in but one thickness, and the outside dressing must be kept well wet, but not dripping, the entire time. To this latter need the patient himself, or any ward attendant can attend, as dryness results in pain, indicating when more solution should be used.

INFECTED WAR WOUNDS ¹

a. The general problem of infection in this war.

I. Comparison with other wars.

II. Remarks by various writers.

III. What infection meant in the early part of the war.

b. Causes of such widespread infection.

c. The steps employed to combat infection, and the results therefrom.

I. Pure surgical steps—mechanical sterilization.

(a) The exponents and their results.

II. The physiological process.

(a) Wright's hypertonic salt solution.

(b) Various techniques for employing the hypertonic salt.

(c) Added use of vaccines.

¹ For full discussion of this subject see Vol. XI, pt. 1. Details of course of instruction are omitted here.—Ed.

III. Chemical sterilization.

- (a) Past history of chemical sterilization.
- (b) Requirements for good antiseptics, and natural limitations of chemical procedures.
- (c) The varied possibilities in chemical compounds.
 - 1. Phenol, etc.
 - 2. Salts of the heavy metals.
 - 3. Oxidizing agents, and other varied types.
 - 4. The dyes.
 - 5. The chlorine group.
 - 6. Hypochlorites.
 - (1) Early history.
 - (2) The physical and chemical characteristics.
 - Strength of watery solution.
 - Reaction and stability.
 - Length of time in which work is done.
 - (3) Special technique necessary.
 - (4) Apparatus necessary for the method.
 - For preparation.
 - For checking up on wards.
 - For each individual patient.
 - For dressing carriage.
 - For bacteriological study of wound.
 - For surgical supply room.
 - (5) Team work an essential.
 - (6) Method of doing the dressing.
 - (7) Objections to the hypochlorite sterilization.
 - 7. Dichloramine.
 - (1) Early history.
 - (2) The physical and chemical characteristics.
 - Strength of oily solution.
 - Stability.
 - (3) Solvents for dichloramine.
 - Eucalyptol.
 - Paraffin oil.
 - Chloreosane.
 - Necessity for chlorination.
 - (4) Method of preparing the solution.
 - (5) Apparatus necessary for the technique.
 - For preparation of the solution.
 - For the dressing.
 - For the surgical supply room.
 - (6) Objections and comparison with hypochlorites.

d. Certain special types of infection.

I. Tetanus.

- (a) Mode of action of *B. tetanus*.
- (b) Observations made during war.
 - 1. Report of R. A. M. C.
 - 2. Atypical tetanus.

II. Gas infection and gas gangrene.

WAR WOUNDS IN GENERAL

- a. The physiologic concept of the soldier.
- b. General statistics regarding war casualties.
 - I. Other wars.
 - II. Present war.

- c. Causes of injuries and surgical conditions.
 - I. Cases other than battle casualties.
 - II. Missiles and other weapons.
 - III. Poison gas, fire, etc.
- d. Transportation of wounded, and question of speed.
- e. Complications of wounds.
 - I. Exposure to cold and weather.
 - II. Lack of food and water.
 - III. Shock and hemorrhage.
 - IV. Trench foot.
 - V. Physical fatigue.
 - VI. Psychic fatigue and shell shock.
 - VII. Asphyxiation.
 - VIII. Burns.
 - IX. Other complications.
- f. Special types of injuries.
 - I. Fractures.
 - II. Head injuries.
 - III. Abdominal injuries.
 - IV. Chest injuries.
 - V. Other special injuries.

* * * * * * *

Not alone have the pyogenic organisms attracted attention in this war, but also the great class of the fecal anaerobes. This group embraces, among others: Tetanus bacillus, gas bacillus, bacillus of malignant edema, *B. edematiens*.

Two in particular have been causes of great mortality in the early part of the war, and have been the subjects of much study: Tetanus (quickly overcome), gas bacillus (still a serious condition).

Tetanus had been exhaustively studied prior to the war, and been controlled under conditions of civil life. At the beginning of the war, it was a serious problem chiefly because no adequate system had been provided for giving the wounded prophylactic treatment. As soon as provision was made for supplying the advanced dressing stations with enough antitoxin, it ceased to be such a serious problem.

Mode of action of tetanus bacillus.

Found in the richly manured soil.

Normal inhabitant of the intestinal tract of horse.

Carried into the wound on foreign bodies.

Anaerobic life.

Localized growth of the organisms.

Production of exotoxin.

Toxin reaches cord through the nerve trunks from the wound.

Secondary importance of spread through blood stream.

Clinical signs of infection.

No local reaction, as with pyogenic organisms.

Incubation period, and relation between the length of the period and the severity of the case.

Classical symptoms.

Recent observations on the earliest symptoms.

General irritability.

Increased reflex irritability and muscle spasm in the affected extremity. (Relation between the mode of reaching the cord and the part first affected.)

Atypical tetanus, and the relationship between the amount of toxin and antitoxin in the cases with localized symptoms.

Delayed tetanus.

Factors causing sudden flare-ups.

Mortality statistics.

Various methods of treatment.

Surgical—prophylactic.

Wound cleansing and institution of adequate antisepsis.

Surgical—therapeutic.

Amputation—reasons why; poor results.

Nerve drainage—reasons why; poor results.

Drugs—therapeutic.

Opiates and sedatives—reason why; limits.

Mag. sulph.—mode of action; results.

Antitoxin—prophylactic.

Number of "units" necessary—American, British.

Duration of immunity, and optimum periodicity of injections.

Question of anaphylaxis—methods of guarding against it and treatment.

Prophylaxis for delayed tetanus.

Time necessary for absorption from different parts.

Antitoxin—therapeutic.

Time to institute treatment.

Points for administration.

Number of "units" to give, frequency, etc.

General statistics regarding gas bacillus.

The *Bacillus aerogenes capsulatus* has long been known, but it has never been conquered in civil life, as has *B. tetanus*.

Very great incidence of "gas infection," with much lower incidence of "gas gangrene."

Mode of action of organism.

Occurrence in nature, and mode of access.

Influence of foreign bodies on growth.

Early localization, and later widespread.

Theory of symbiosis.

Association with streptococcus.

Preparation by streptococcus or other organism for the spread of *B. aerogenes*.

Intoxication from products of necrosis.

Roll of gas in opening channels.

Theory of Bull.

Production of exotoxin in vitro.

Experimental evidence.

Nature of toxin.

Antitoxin, and experimental results.

Ability of *B. aerogenes* to prepare its own soil for growth.

Clinical signs and symptoms.

Earliest—muscle rigor.

Cutaneous changes.

Crepitation.

Odor.

Incubation period.

Toxemia.

Morbidity and mortality.

Treatment.

Surgical—prophylactic.

Early adequate surgery, especially the removal of all foreign bodies and devitalized tissue.

Surgical—therapeutic.

Very radical surgery, amputation if necessary, excision of all affected muscles.

Antiseptic—prophylactic.

Early use of antiseptics.

Oxidizing agents.

Treatment—Continued.

Antiseptic—therapeutic.

Dakin's solution, detoxicating effect.

One per cent chlorohydrate of quinine.

Oxygen needled into involved tissue.

Antitoxin—prophylactic.

Still subjudice.

Antitoxin—therapeutic.

Still subjudice.

General statistics.

* * * * *

THE SURGERY OF FRACTURES

Fractures, types of:

1. Closed or simple.

2. Open or compound—special type gunshot.

Mechanism:

Direct violence.

Indirect violence.

(Special type, museular action.)

Symptoms:

Pain—

1. On direct pressure—digital.

2. On indirect pressure.

3. On cross strain.

Deformity—

1. Long axis.

2. Transverse axis.

3. Axial rotation, etc.

Abnormal motion.

Crepitus.

Change in soft parts, ecchymosis, skin blebs, laceration of muscles, injuries to blood vessels, nerves, etc.

Shock.

Fat embolism.

Treatment:

First aid—

Weight bearing—nonweight bearing bones.

Closed or open fractures—

First essential is rest. Avoid unnecessary examination and manipulation.

Remove clothing, splint injured part with apparatus at hand in axis of limb.

Give morphine.

Upper extremity—

Arm to chest—axillary pad.

Screen-wire and wood splints.

Thomas arm splint—elbow splint.

Lower extremity—

Rifle down side of leg—folded coat or blanket between leg and bind legs together.

Wooden splints, wire or metal splints.

Thomas knee splint.

Open (compound) fractures—

By direct violence, gunshot—

Transportable.

Nontransportable.

By indirect violence.

Treatment—Continued.

First aid—Continued.

Cut away clothing.

Treatment of the wound—iodine over skin and projecting bone.

Dressing—sterile dressing or alcohol dressing.

Immobilization in long axis, avoiding unnecessary handling.

Hemorrhage—

Elevation.

Pressure.

Tourniquet.

Ligation of vessels.

Immediate amputation.

Treatment of wound in soft parts in fractures by direct violence and gunshot fractures:

Inspection to determine—

If transportable.

If not transportable.

Early adequate surgery:

Wide opening and exposure, leaving no pockets; removal of foreign material; cut away dead and contaminated tissues; remove loose bone fragments.

Sterilization of wound—

Before six hours.

After six hours.

Formalin 1 per cent, H_2O_2 , saline.

Iodine.

Dakin-Carrel.

Dichloramine-T, in chlorinated eucalyptol.

Clumsky solution, etc.

Modern method of treating fractures:

1. By massage and mobilization.

2. Manipulation with fixation by external device after reduction.

3. Splints—

Wooden, wire, tin, etc.

Plaster splints, molded plaster.

More complicated and orthopedic splints, Thomas type.

4. Extension methods—

1. With straight limb—

Buck's extension with Volkman sliding rest. (Bardenheuer and Cologne school.)

2. With flexed limb—

Hodgen splint (with combined traction of Stimson).

Zuppinger, inclined plane, etc.

Balkan splint.

By transfixing nails, rods, etc.

5. Open operation.

GENERAL CONCEPTIONS

1. Unnecessary manipulation under improper surroundings should be avoided. Splint the fractured area (in the long axis of the limb, if an extremity) and transport the patient to a place suitable for the handling of the injury in question. If the patient is in shock or pain, use morphine. If an open fracture, iodine on skin, sterile dressing. Treat major injuries (blood vessels) at once. Otherwise prepare for transportation to fully equipped station.

2. Reduce the fracture as soon as possible after the injury. This reduction should not be delayed beyond two hours. In open fractures, before six hours, excise loose fragments, remove foreign material, excise contaminated and devitalized tissues, sterilize wound. If possible to close, insert sutures to be tied if wound remains clean. After six hours, treat as above, except leave wound open and close later when wound has become free from infection.

3. Reduction and the proper and complete examination to determine the type and character of the fracture should be done under an anesthetic. (Naturally the same general contraindications to the use of an anesthetic apply here as are found to apply in other fields of surgery.)

4. Have an X-ray plate made if such a plate can be made without unnecessary delay. No reduction should be delayed, however, beyond the time set in paragraph 2 to await X ray. An X ray must always be made after a reduction and should be made the day of the injury. It is, perhaps, superfluous to add that the surgeon should interpret the X-ray plates himself.

5. Every fracture treated by traction should have an X ray taken with the traction apparatus in position and in full operation.

6. Every fracture of the long bone should have the proximal and distal joints included in and immobilized by the fixation apparatus.

7. The fixation apparatus used should be easily removable, procurable everywhere, and should not be applied too tightly.

8. If the fracture is obviously irreducible, or if the X ray taken after the supposed reduction shows that that reduction is unsatisfactory, other treatment should be institute promptly.

9. Operation should be done within the first 14 days; 4 to 7 days for the smaller bones, 9 to 11 days for the larger bones. All cases operated upon later than two weeks should be considered as late operations. (Obviously operation may be done immediately for complicated injuries to the soft parts.) Open fractures should be operated upon as early as possible. (See par. 2.)

Use of X ray in fractures.

Delayed union; nonunion; pseudoarthrosis.

Process of repair in bone.

Effect of suppuration upon repair.

Regional fractures.

INJURIES OF SKULL, SPINE, AND PERIPHERAL NERVES

INJURIES OF SKULL

Injuries.—Menace of infected wounds of skull coverings. Contusions of skull, causing hematoma, epidural hemorrhage, contusions of brain. Punctate hemorrhages, possible subsequent degenerative changes.

Symptoms.—Symptoms due to fracture proper, plus hemorrhage, brain trauma; immediate, secondary, infection.

Treatment and operative technique.—Wounds of skull; incised; puncture; fractures of vault of skull (simple or compound); fissured; inner table only; depressed, comminuted; gunshot.

Fractures of the base of the skull (simple or compound).—Symptoms due to hemorrhage, escape of spinal fluid, injury to brain, injury to cranial nerves; infection.

Treatment.—Operative technique of subtemporal decompression.

INJURIES OF SPINE

Contusions.—Local symptoms; possible cord symptoms, from punctate hemorrhages hematomyelia.

Treatment.

Sprains.—Gradually induced by heavy load; suddenly induced by heavy lifting, falling, or impact of falling weight.

Treatment.

Dislocations.—Usually associated with fractures; otherwise usually without cord symptoms.

Fractures and fracture dislocations (with or without cord injuries).—Direct violence, involving usually, spinous processes and laminae; any portion of vertebra when due to projectiles; indirect violence, involving, usually, crushing of bodies, plus, in severe cases, dislocation, with possible fracture of articular processes and arches.

Symptoms.—Without cord involvement, local signs of fracture; with cord involvement, local signs of fracture, plus cord symptoms varying with level of the lesion and completeness of damage to cord; immediate; remote.

Treatment.—Operative technique.

INJURIES OF PERIPHERAL NERVES

General consideration as to nerve properties.—Trophic centers; degeneration; time involved; lapse of time after which regeneration may occur; result of nerve paralysis on muscle.

Division of nerve.—Incomplete and complete; physiological; anatomical; nerve bulbs on proximal and distal stumps.

Pathology.—In nerves, early; in muscles, late.

Symptoms.—Vary with site of lesions and completeness of division; primary roots, motor; peripheral trunks, sensory; lapse of time after injury; early; late.

Treatment.—Rendering wounds sterile; preventing overstretching of paralyzed muscles; nerve repair as soon as is feasible; physical therapeutics before and after operation.

Types of operations.—Neurolysis; end to end suture; various implantations; transposition; transplantation; bridging; suture materials; protection with eargile membrane.

After treatment.—Physical therapeutics; reeducation.

Results.—Immediate; remote.

PATHOLOGY OF TRAUMA OF THE SKULL AND CONTENTS

Three lectures, with demonstration of specimens illustrating injury to the skull, brain, and its membranes, with consideration of the mechanism and clinical history as an aid to diagnosis, localization, and treatment.

1. *The mechanism of fractures of the skull.*—Direct fractures of the vault at place of contact of violence. Localization of the fracture in relation to associated intracranial hemorrhage. Fracture without wound or abrasion of scalp; localization by hematoma of scalp at place of contact and extracranial hemorrhage into scalp from fracture.

2. *Traumatic intracranial hemorrhages.*—Clot from laceration of the middle meningeal artery by fracture. Subdural clot from laceration of the brain. Anatomy and mechanism of indirect laceration of the brain an aid to the localization where focal symptoms are absent.

3. *Compression of the brain.*—(a) Compression by traumatic hemorrhage. Disease associated with hemorrhage producing compression. Internal hemorrhagic pachymeningitis, central cerebral hemorrhage (apoplexy), ruptured aneurysm of circle of Willis and branches. (b) Compression by suppurative inflammation. Internal suppurative pachymeningitis from punctured wound of skull (subdural empyema). Suppurative meningitis (leptomeningitis) from infection through fracture. Traumatic suppurative meningitis without fracture. Abscess of brain. The cerebrospinal fluid obtained by lumbar puncture an essential aid in diagnosis and treatment.

TRANSFUSION*

The life-saving effect of transfusion upon patients who have passed into a serious condition as a result, in whole or in part, of hemorrhage, is universally acknowledged.

* * * * *

As regards the indications for transfusion, the more the condition of the patient is due to a loss of blood, the greater is the benefit which may be expected from transfusion. No fact so emphasizes the importance of this indication for transfusion as the difference between the results following the use of transfusion in depressed states of vitality due to pure hemorrhage and to pure shock.

In contrast to the almost literal resurrections following transfusion after hemorrhage, the results in conditions due to shock alone are disappointing. This is a fact which has been confirmed by a number of observers, notably in a recent article by Archibald and McLean (Shock in War Surgery, *Annals of Surgery*, September, 1917, lxvi, No. 3, 280). It is a fact supported by animal experimentation, and one quite in accord with the best accepted theories of the nature of shock.

*For a full discussion of this subject see Vol. XI, pt. 1, Chap. VII, p. 185. Details of course of instruction are omitted here.—Ed.

The symptomatology of the states produced by both shock and hemorrhage is so similar that only the history may enable one to determine to which of the two causes the depressed condition of the patient is due. The distinction, however, is of greater theoretical than practical importance, because hemorrhage and shock are more often combined in the same patient than otherwise, and the patient should then be treated as a case of hemorrhage. The favorable result of the transfusion will be directly proportional to the degree with which the symptoms are due to hemorrhage.

Unquestionably the loss of blood when it occurs early, as it usually does, protects the patient against the internal sequestration of a large proportion of the circulating blood, upon which sequestration the development of shock depends. This fact is, doubtless, the explanation in a large degree for the favorable results following transfusion after hemorrhage in patients also subjected to causes of shock. It is, however, desirable to recognize the usual ineffectualness of transfusion in shocked patients who have not suffered from hemorrhage.

While hemorrhage is the usual indication for transfusion in war surgery, it is not the only indication. Instances of poisoning by carbon monoxide occur in the Army, and the usual beneficent results have followed transfusion of patients so poisoned. (Robertson and Watson.) Transfusion is of great value in anemic conditions preceding serious operations.

Other indications for transfusion chiefly concern medical cases. They include the various anemias:

- Secondary anemia.
- Pernicious anemia.
- Leukemia.
- Baeteremia.

And as a last resort in desperately ill medical cases.

The following are some of the specific conditions for which transfusion has been used in a series of 165 instances reported by Unger:

1. Hemorrhage:

- Gastric and duodenal ulcer.
- Typhoid fever.
- Postoperative hemorrhage.
- Ectopic gestation.
- Uterine hemorrhage.
- Ulcerative colitis.
- Jaundice.
- Hemorrhage associated with blood diseases.
- Micellaneous cases—
 - Hematemesis of unknown origin.
 - Intestinal hemorrhage of unknown origin
 - Multiple hereditary telangiectases.

2. Blood diseases:

- Secondary anemia.
- Pernicious anemia.
- Hemophilia.
- Purpura hemorrhagica.
- Leukemia.
- Bleeding of new born.
- Banti disease.
- Von Jakseh's anemia.
- Henoch's purpura.

3. Toxemias:

- Pneumonia.
- Pyogenic infections with extreme toxemia.
- Coal-gas poisoning.
- Morphine poisoning.
- Uremia.
- Scourvy.
- Toxemia of pregnancy.

4. Infections:

Localized pyogenic infections.

Bacteremia.

5. Shock.

6. General debility, previous to operation.

Meleney, Steerns, Fortune, and Ferry (*American Journal of Medical Science*, Nov., 1917, cliv, No. 5, 733) have concluded, as a result of a review of 64 of these medical cases, that the treatment was merely palliative in the majority, but to a degree which in no way detracts from the value of the procedure; for many incurable patients have been given months of fairly good health, and, in many instances, spontaneous remissions have been definitely hastened. Of the medical cases, the pernicious anemias have been most benefited.

* * * * *

X-RAY DIAGNOSIS

LECTURE I

Introductory:

The production of X rays.—Phenomena of electric discharges in air; in vacuo. The energizing current. Cathode stream. X rays. Gas tube. Coolidge tube. Properties of X rays. Penetration. Fluorescence. Ionization; chemical effects. Absorption by various tissues. Record of densities as shown on fluorescent screen; on plate. Central ray. Divergent rays. Distortion. Technical axioms. Application. Methods of X-ray examination:

Fluoroscopy—general.

Orthoradioscopy—examination with central ray.

Radiography.

Stereography.

Teloradiography.

Serial radiography.

Posture.—Positions. Centric examination. Sagittal views. Frontal views. Oblique views. Eccentric examination. Methods of immobilization. Use of contrast media: esophagus, gastrointestinal tract, sinuses.

LECTURE II

Interpretation: Tissue density as shown on plate. Determination of posture, position, side, age, sex.

1. Appearance due to artifacts—plate, developer, movement of part.

2. Appearances due to foreign bodies—clothes, buttons, teeth filling, bandages, immobilization apparatus.

3. Appearances due to soft tissues—muscles, tendons, ligaments, breasts, buttocks.

4. Normal Roentgen anatomy—epiphyses, developmental variations. Interpretation of pathological findings on clinical and pathological basis.

5. Variations—in relation to clinical symptoms.

6. Accidental findings.

7. Negative examinations.

8. Limitations of the X-ray examination. Methods of analysis—fractures and dislocations, bone diseases, joint diseases, thoracic diseases, gastrointestinal diseases.

LECTURE III

Fractures.—Fluoroscopy, radiography, technique of arrangement for various views of various joints. Sources of error, study of deformity; study of callus.

Scheme of analysis

Bone

R. L.

Union.	
Associated fraetures.	
Complications:	
Inflammation.	
Tumors.	
Syphilis.	
Foreign bodies.	
Operative procedures.	

LECTURE IV

Bone inflammations.—Normal bone markings—Haversian system as shown on plate; pathological basis of radiographic appearances in periostitis, ostitis, osteomyelitis.

Scheme of analysis for radiographic study of bones

Periost. (periosteal shadow is to be differentiated from the cortical shadow only under pathological conditions):

1. Exudative.
2. Productive.
3. Destructive—periosteal; subperiosteal.

Cortex.

1. Atrophy (shown as loss of bone density)—
 - Lamellar—lamellæ intact.
 - Lacunar—lamellæ perforated.
2. Sclerosis—productive process—general; localized.
3. Necrosis—destructive process—inclosed by sclerosis; not inclosed by sclerosis.
 - Erosions.
 - Defects.

Medulla—

Atrophy.

Widened.

Narrowed.

Soft tissue:

1. Infiltration—localized; general.

2. Sinus formation; air—

Macular—in connective tissue.

Linear—in muscle tissue.

3. Calcification—sequestal, interstitial, arthritic.

Diagnosis.

LECTURE V

Study of chest.

Relation of air content to illumination of pulmonic fields.

Relation of vascular content to number, size and density of pulmonic markings.

Relation of heart shape to valvular defects.

Analysis of thorax picture—Scheme for Roentgenological study of the chest

1. Pulmonic fields.
 - Shape—triangular, rounded, irregular.
 - Size—height, width; equal, unequal; large, medium, small.
 - Illumination—bright, brilliant, deficient, absent; general, local; location, borders; sharp (concave, convex, horizontal), indefinite, mobile, immobile.
 - Expansion—equal, unequal, diminished.
2. Hilum shadows.
 - Shape.
 - Size.
 - Structure.
 - Density.
 - Calcification.
 - Pulsation.
3. Pulmonic markings.
 - Number.
 - Size.
 - Shape.
 - Extension.
 - Density.
 - Distribution—general, local.
4. Tracheal and bronchial outlines—air content.
 - Trachea—size, shape, position, bifurcation (site).
 - Main bronchi.
 - Relation to hilum shadow.
 - Relation to aortic arch.
5. Diaphragm.
 - Position (relative).
 - Shape.
 - Contour—regular, irregular, concave, wavy; convex, billowy.
 - Movement.
6. Vertebra, ribs and spaces.
 - Structure.
 - Direction.
 - Width.
7. Cotodiaphragmatic space.
 - Size.
 - Shape.
 - Illumination.

8. Median shadow.

Outline—left aorta, pulmonary artery, left auricle, left ventricle, right auricle, right aorta.

Size—small, normal, large.

M. R.—Maximum deviation of the heart shadow to right of median line.

M. L.—Maximum deviation of heart shadow to left of median line.

T.—Total heart width = M. R. + M. L.

P.—Total pneumonic field radius.

L.—Heart length, "apex to base."

V.—Angle of ventricular line to horizontal = 45° .

Position—normal, transposed, displaced.

Axis—vertical, oblique, transverse.

Shape—normal, spherical, oval, triangular, rectangular.

Movements—as a whole, its individual chambers, the great vessels.

9. Aorta.

Size—small, normal, large; length from junction of right auricle to summit of arcus; width at base, at arcus.

Shape—ascending, arcus, descending.

Position.

Density.

Movement.

10. Upper mediastinal shadow.

Size.

Shape.

Outline.

Position.

Tracheal position.

11. Retrosternal space.

Size.

Shape.

Illumination.

12. Retrocardia space.

Calcification.

Shadows.

13. Esophagus.

Pathological findings.

Interpretation.

Diagnosis.

METHOD OF REPORT

A radiographic examination of the chest gives the following results.

The pulmonic fields are of $\left\{ \begin{smallmatrix} \text{even} \\ \text{uneven} \end{smallmatrix} \right\}$ size, the $\left\{ \begin{smallmatrix} \text{right} \\ \text{left} \end{smallmatrix} \right\}$ being $\left\{ \begin{smallmatrix} \text{larger} \\ \text{smaller} \end{smallmatrix} \right\}$ and of $\left\{ \begin{smallmatrix} \text{even} \\ \text{uneven} \end{smallmatrix} \right\}$ illumination, the $\left\{ \begin{smallmatrix} \text{right} \\ \text{left} \end{smallmatrix} \right\}$ being deficient in illuminations in its $\left\{ \begin{smallmatrix} \text{middle} \\ \text{upper} \\ \text{lower} \end{smallmatrix} \right\}$ part.

The pulmonic markings $\left\{ \begin{smallmatrix} \text{are} \\ \text{are not} \end{smallmatrix} \right\}$ increased in $\left\{ \begin{smallmatrix} \text{number} \\ \text{density} \end{smallmatrix} \right\}$ in the entire part of the field.

The markings $\left\{ \begin{smallmatrix} \text{are} \\ \text{are not} \end{smallmatrix} \right\}$ confluent. There is an obliteration of the pulmonic markings and illumination over an area bounded by ribs. This is $\left\{ \begin{smallmatrix} \text{even} \\ \text{uneven} \end{smallmatrix} \right\}$ in its distribution.

The costophrenic space is $\left\{ \begin{smallmatrix} \text{well illuminated.} \\ \text{obscured.} \end{smallmatrix} \right\}$

The median shadow is $\left\{ \begin{smallmatrix} \text{distorted} \\ \text{normal} \end{smallmatrix} \right\}$ displaced $\left\{ \begin{smallmatrix} \text{downward.} \\ \text{upward.} \\ \text{right.} \\ \text{left.} \end{smallmatrix} \right\}$

The diaphragmatic outlines are $\left\{ \begin{array}{l} \text{visible} \\ \text{invisible} \\ \text{regular} \\ \text{irregular} \end{array} \right\}$ defined $\left\{ \begin{array}{l} \text{sharply} \\ \text{not sharply} \end{array} \right\}$ and in $\left\{ \begin{array}{l} \text{normal} \\ \text{abnormal} \end{array} \right\}$ relation to each other, the $\left\{ \begin{array}{l} \text{left} \\ \text{right} \end{array} \right\}$ being higher.

The pathological findings are -----

This would indicate the presence of -----

LECTURE VI

Localization of foreign bodies:

Principles and general methods.

Plate localization.

Fluoroscopic localization.

Stereoscopic localization.

Localization of foreign bodies in the eye.

Practical lessons

Lesson I.—A demonstration of laboratory organization: Equipment; units; laboratory routine; radiographic technique.

Lesson II.—Fluoroscopy: Advantages; disadvantages; ray quality and quantity; screen under suspension; sensitization of the eye; protective measures—operator, patient; limits of safety.

Manipulative procedures—palpation—magnification.

Study of bony system: Chest; gastrointestinal tract.

Placing the patient in postures, positions.

Demonstration of the causes of distortion and how to obviate them.

Lesson III.—Fractures, upper extremities. Reports of cases by students according to scheme outlined, these reports being subjected to general criticism and comment.

Lesson IV.—Fractures, lower extremities.

Lesson V.—Study of the head and spine, normal and pathological: Suture markings; vascular markings; air sinuses; sella turcica.

Study of air or gas in soft tissues—detection—localization.

Lesson VI.—Study of osteomyelitis. Reports of cases by students on the basis of scheme outlined, these reports subjected to general criticism and comment.

Lesson VII.—Study of differential diagnosis of inflammatory bone diseases from syphilis, tumor, and systemic bone conditions.

Lesson VIII.—Study of chest conditions—pneumothorax, effusions, consolidations.

Lesson IX.—Localization of foreign bodies. Practical demonstration.

MAYO CLINIC, ROCHESTER, MINN.

The courses of instruction in war surgery at the Mayo Clinic, Rochester, Minn., for officers and other Medical Department personnel, included the officers' school of general and war surgery; courses of instruction in anesthesia for nurses; courses of instruction for enlisted men for operating-room assistants. The courses were begun in November, 1917,¹⁷ and were discontinued in the spring of 1919.¹⁸ As originally planned, the courses were to extend over a period four weeks,¹⁹ but this was soon changed, and the later courses covered a period of six weeks.²⁰ An outline of the course extending from December 9, 1918, to January 18, 1919, follows:²¹

ANNOUNCEMENT

Class was divided into six sections. Sections were required to follow schedule. Members of sections required to report on work assigned.

St. Mary's Hospital.—General and special surgical and pathological clinics were given every morning; orthopedic surgery, Thursday morning; neurological surgery, Saturday morning.

Colonial Hospital.—Orthopedic surgery, every morning except Monday and Thursday; ear, nose, and throat surgery, every morning; plastic and oral surgery; general surgery, every afternoon.

Mayo Clinic Building.—Genitourinary clinic, second floor, every morning, 8.30 o'clock; eye, ear, nose, throat, and oral surgery clinic, second floor; orthopedic department, annex, clinical laboratory, second floor, experimental laboratory, fifth floor, Roentgenology clinic, second floor, every afternoon.

OUTLINE OF COURSE FOR SIX WEEKS

St. Mary's Hospital:	Hours
Surgical and pathological clinics.....	136
Colonial Hospital:	
Surgical and pathological clinics.....	76
Orthopedic surgery.....	
Eye, ear, nose, and throat surgery.....	
Mayo Clinic Building:	
X-ray clinics.....	3
Genitourinary.....	6
Experimental laboratory.....	6
Clinical laboratory.....	3
Eye, ear, nose, and throat clinics.....	6
Orthopedic clinics.....	6
Lectures.....	39
	69
Total.....	281

The classes and demonstrations were conducted by the staff of the Mayo Clinic, most of whom were members of the Officers' Reserve Corps, on the inactive list, receiving no salary from the Government. Thirteen classes and a total of 226 officers received instruction at the clinic.²⁰

In addition to the officers who were given instruction in the Mayo Clinic, classes of enlisted men were ordered there for training as operating room orderlies and classes of nurses were trained there as anesthetists.²⁰ Five classes of enlisted men, totaling 116, took the course.²⁰ The first course began in April, 1918, and was completed on June 5.²² A noncommissioned officer was detailed to the director of the school as his assistant in looking after the details of the clothing, subsistence, etc., of the enlisted men.²²

The following is a copy of the schedule of instruction given the enlisted men:²⁰

SCHEDULE OF LECTURES AND PRACTICAL DEMONSTRATIONS FOR THE ENLISTED MEN
(OCTOBER 21 TO NOVEMBER 29, 1918)

Practical anatomy and physiology (3 lectures—Monday, October 21, October 28, November 4, 1918).

- (1) Bone and muscles.
- (2) Blood and central nervous system.
- (3) Internal organs; position and formation.

Report at St. Mary's Hospital lecture room, 4 p. m.; sections A and B.

Practical hygiene (3 lectures—Monday November 11, November 18, November 25, 1918).

Report at St. Mary's Hospital lecture room, 4 p. m.; sections A and B.

Bandaging (3 lectures—Tuesday, October 22, October 29, November 5, 1918).

Each private required to learn to make the following: 1 circular, 2 oblique, 3 spiral reverse, spica of finger, spica of thumb, construct a sling, figure-of-eight for knee and elbow, Barton bandage, four-tail bandage for head.

Report at St. Mary's Hospital lecture room, 4 p. m.; section A.

Bandaging (3 lectures—Tuesday, November 12, November 19, November 26, 1918).

(Same as shown above for section A.)

Report at St. Mary's Hospital lecture room, 4 p. m.; section B.

Dressing of wounds (3 lectures—Tuesday, October 22, October 29, November 5, 1918).

(1) Types of wounds, burns, and frost bites.

(2) Immediate treatment; antitetanic serum, control of hemorrhage, cleansing of wounds, first-aid dressings.

(3) Drainage; antiseptics, dressings, special care.

Report at Desk C-b, Mayo Clinic, 4 p. m.; section B.

Dressing of wounds (3 lectures—Tuesday, November 12, November 19, November 26, 1918).

(Same as section B, shown above.)

Report at Desk C-b, Mayo Clinic, 4 p. m.; section A.

Sepsis and antisepsis (4 lectures—Wednesday, October 23, October 30, November 6, November 13, 1918).

Report at St. Mary's Hospital lecture room, 4 p. m.; sections A and B.

Usages of common drugs (2 lectures—Wednesday, November 20, November 27, 1918).

Description, dosage, demonstration of the following: Sedatives—Morphine, codine, heroin, aspirin, bromide, veronal. Stimulants—Ammonia, aromatic spirits; camphorated oil, atropin, coffee, digitalis. Cathartics—Castor oil, licorice powder, pills, etc.

Report at St. Mary's Hospital lecture room, 4 p. m.; sections A and B.

Operating room technique—sisters, anesthetists, surgeons (6 lectures—Thursday, October 24, October 31, November 7, November 14, November 21, November 28, 1918).

(1) Importance of hospital to the sick; lifting a patient on cart; dressing and undressing patient; how to give a patient water and food; temperature, baths, urinal; how to assist; disinfectants; bedpan; enemata; bed making.

(2) Asepsis; sterilization (*a*) scrubbing, (*b*) boiling and steam, (*c*) antiseptics; practical demonstration of preparation of sponges, pack, and salts, and sterilization of the same.

(3) Lecture 15 minutes on the care and sterilization of instruments; familiarization of instruments.

(4) Care and sterilization of ligatures; contents of emergency kit; Red Cross hospital supplies; review of instruments.

(5) Operating-room technique: (*a*) Care of sterile instruments and supplies; (*b*) preparation of surgical assistants; (*c*) preparation of patient; (*d*) anesthetics.

(6) Mock operation with review of operating-room technique.

Report at St. Mary's Hospital operating rooms, 4 p. m.; sections A and B.

Discussion of gas poisoning, drowning, shock (section A—Friday, October 25, November 1, November 8, 1918; section B—Friday, November 15, November 22, November 29, 1918).

Report at St. Mary's Hospital operating rooms, 4 p. m.

Demonstration of blood transfusion, intravenous saline, hypodermoclysis (section B—Friday, October 25, November 1, November 8, 1918; section A—Friday, November 15, November 22, November 29, 1918).

Report to Colonial operating rooms, 4 p. m.

Use of splints and plaster of Paris casts (9 lectures—section A, Monday, October 21, October 28, November 4, 1918; Wednesday, October 23, October 30, November 6, 1918; Friday, October 25, November 1, November 8, 1918. Section B, Monday, November 11, November 18, November 25, 1918; Wednesday, November 13, November 20, November 27, 1918; Friday, November 15, November 22, November 29, 1918).

Report at desk E1, Mayo Clinic, 7 p. m.

Technique in genitourinary preparation, (6 lectures—section B, Tuesday, October 22, October 29, November 5, 1918; Thursday, October 24, October 31, November 7, 1918. Section A, Tuesday, November 12, November 19, November 26, 1918; Thursday, November 14, November 21, November 28, 1918).

Report at desk A², Mayo Clinic, 7 p. m.

NOTE.—At the end of the course, each man was given a written and an oral examination.

The classes in the course in anesthesia were conducted for nurses beginning in April, 1918. Twenty nurses were trained in this work. The following is a copy of the schedule of instruction in anesthesia:²⁰

LECTURES

1. *Circulation*.—The course, purpose, and mechanism of the circulation of the blood. The physiological significance of blood pressure, the pulse, etc. The importance of this to anesthesia.

2. *Respiration*.—The purpose and mechanism of respiration. The physiological change that takes place in the lungs, etc. Relation of respiration to etherization.

3. *The nerve mechanism* in connection with the circulation and respiration. The nerve control of the circulation and respiration. How etherization modifies this.

4. *Physiology of anesthesia*.—Effect of the anesthetic upon blood pressure and respiration. The different stages of anesthesia.

5. *Physiological compensation during anesthesia*.—The adaptation of the anesthetic to the surgical procedure.

6. *Accidents occurring during anesthesia*.—Overetherization, shock, hemorrhage, etc.

7. Quiz.

DEMONSTRATIONS

1. A graphic study of the circulation and respiration. Attempts were made to demonstrate all of the important points emphasized in the first four lectures.

2. A study of the accidents occurring during anesthesia and the methods of combating them.

DIVISION OF GENERAL SURGERY

(a) Practical work:

1. Each nurse had five general anesthetics under the supervision of the regular anesthetist.
2. Practical demonstrations each day.
3. Ether by the drop method.
4. Induction; maintenance.

(b) Respiration and circulation during maintenance:

1. Complications during induction.
2. Complications during maintenance.
3. Artificial respiration; demonstrations.

(c) Blood pressure:

1. General principles and theoretical considerations.
2. Practical demonstration.

(d) Quiz.

SCHOOLS OF PLASTIC AND ORAL SURGERY

It became apparent to the Surgeon General, in July, 1917, that there was at his command an inadequate number of general and dental surgeons sufficiently experienced in plastic and oral surgery to take care of the cases of maxillofacial injuries that we were likely to encounter.²³ He planned, therefore, to secure the services of surgeons of the highest type and of considerable experience in plastic and bone surgery, and also of qualified dental surgeons, and to give both of these classes a course of instruction in plastic and oral surgery,

conducted by qualified instructors. These surgeons and dentists were to work and be trained together so that units, to be composed of a surgeon and a dental surgeon, could be formed which would give to the patients to be treated the skill of the two professions. The Surgeon General accordingly authorized the establishment of three medical schools to give special courses of instruction in plastic and oral surgery for officers assigned to that work.

Letters were then sent, through the Council of National Defense, to more than 200 prominent surgeons in the United States, to more than 800 teachers in dental colleges, and to other prominent dental surgeons, asking for suggestions as to individual men whose training and practice were such as to make them especially fitted for plastic and oral surgery.²³ In this way a long list was obtained to whom questionnaires and letters of inquiry were sent. Students for the schools were selected in the main, after a careful study of the answers to these questionnaires and letters. An advisory board, consisting of five prominent surgeons was called to meet with the subsection of the section of plastic and oral surgery, Surgeon General's Office, September 6, 1917, and it was decided at this meeting to open the first school in St. Louis.²³ The medical and dental departments of Washington University, St. Louis, offered their facilities unrestrictedly to the Surgeon General, without charge for the materials used. Two other schools were later established, one at the University of Pennsylvania, Philadelphia, and the other at Northwestern University, Chicago, Ill.²⁴

The schools were under the control of the Surgeon General, who designated the teaching staff and outlined the curriculum. The courses of instruction varied from 16 days to 4 weeks, and extended from October 15, 1917, to March 30, 1918.²³ All assignments of students were made from the Surgeon General's Office, after first making satisfactory arrangements with each student by correspondence or conference. Reports of efficiency and class standing were made to the Surgeon General at the close of each course and many reports and recommendations were unofficially made to the chief of the section in the Surgeon General's Office. In this way it was possible to obtain a very fair knowledge of each man's ability and qualifications at the end of his course of instruction.

It was customary, after the completion by these students of the courses of instruction, to assign a surgeon and a dental surgeon together to a base or evacuation hospital, the two composing a unit which constituted a division of the section of head surgery in the hospital. This unit, unless otherwise specified, had charge of injuries and surgical diseases of the mouth and its essential structures, including the bony framework and the soft tissues of the face, and also of the neck, with the exception of diseases and injuries that properly come under the specialties of ophthalmology, otolaryngology, neurologic surgery, and diseases of the thyroid gland. The instructors of the schools were selected from the staffs of the schools giving the courses and from the staffs of the affiliated institutions. Many of these institutions, as well as many of the students, were not on active duty and received no pay from the Government. Others were appointed contract surgeons, some of whom donated their pay to help defray the expenses of the courses of instruction. Following the plan inaugurated in the Chicago school, mimeographed copies of references to all obtainable

war literature were made and sent to the other schools in sufficient number to allow each student officer to have a complete copy. Students were required to furnish many of their own books. The schools were closed in March, 1918, the instruction being continued at the medical officers' training camps.^{23 25}

The numbers of officers who attended the courses in these schools were: Medical officers, 164; dental officers, 123.²⁶

Three courses were given in Philadelphia at the Thomas A. Evans Museum and Dental Institute of the School of Dentistry of the University of Pennsylvania, and the facilities of the following institutions were placed at the disposal of the director: Jefferson Medical College and Hospital; Medico-Chirurgical College and Hospital; Philadelphia General Hospital; Pennsylvania Hospital; Hahnemann Hospital; and Temple University.²⁷

The institutions affiliated with the Chicago school were as follows: Wesley, St. Lukes, Cook County, Presbyterian, Augustana, and Francis Willard Memorial Hospitals, and John Crerar Library. The teaching staffs of these schools were selected principally from the staff of the institutions in which the instruction was given and from the institutions associated with them. Two courses of instruction were given at the Chicago school.²⁸

The courses were similar in the three schools. The one conducted in St. Louis is given here as an example.

SCHOOL OF NEUROLOGICAL, PLASTIC, AND ORAL SURGERY, ST. LOUIS, MO.

This school was attended by surgeons and dentists, and courses in neurological surgery were given in conjunction with those in oral and plastic surgery beginning with the second course. During the first two weeks the morning sessions of the two groups were separate. Both groups together participated in the afternoon sessions. The courses occupied 16 working days, from 9 a. m. to 6 p. m.²⁹

SCOPE

- (a) To teach cooperation between surgeons and dentists.
- (b) To demonstrate the methods of immediate immobilization of mandibular fractures, the repair of soft parts with free drainage, the construction and use of emergency splints, and the care of complicating injuries.
- (c) To instruct in the treatment of face and oral injuries during the healing stage; repair of defects of bone and soft parts by plastic operations; construction of permanent prosthetic apparatus.

COURSES

Anatomy (51 hours); dentists attended the demonstrations only.

- (a) Dissection: Complete detailed dissection of head and neck by each surgeon (35 hours).
- (b) Demonstration daily reviewing the ground covered by that day's dissection.
- (c) Surgical anatomy of the head and neck emphasizing landmarks, surgically important structures, regions prone to harbor infections, surgical relations.

Numerous skulls, model dissections, and permanent specimens were at the disposal of the students.

Infective processes about mouth, face, and neck (7 hours).

- (a) Oral and dental infections: The recognition and treatment of diseases of the mouth and teeth, bacterial flora of the mouth, periodontal infection, their sequelae and influence upon injuries.

(b) Infections of soft tissues and bones: Erysipelas, traumatic and nontraumatic inflammation of the salivary glands, adjacent regions involved by infection, complications due to extension of inflammation (intracranial) thromboses, meningitis, edema of glottis, angina Ludovici, cervical infections, etc.

(c) Infections of maxillary antrum: Anatomy, diseases, symptoms, injuries, standard operations.

(d) Salivary infections and fistulae: Symptoms, treatment.

Fractures (4 hours).

The recognition and treatment of fractures of upper and lower jaw; surgical anatomy; importance of restoring dental occlusion; avoidance of deformity; complications noted in gunshot wounds; drainage of submaxillary region. The diagnosis and treatment was further illustrated in operative course "a." Treatment of temporomaxillary ankylosis.

Splints (7 hours).

(a) Demonstrations of the forms of temporary and permanent dental splints used for immobilization of mandibular fractures, special value of individual forms, selection of type to be employed.

(b) Demonstration; preparation of dental splints in presence of surgeons.

Operative course (27 hours); surgeons assisted by dentists.

(a) Plastic methods on the cadaver: Preliminary lectures preceded each day's laboratory work covering the operations to be performed that day. Students working in groups of three.

Repair of defects of the soft parts of the face by sliding and pedunculated flaps; reconstruction of lips and cheeks; repair of scar deformities of lips and eyelids; Thiersch and Wolff grafting; immobilization of fractured mandible by wiring of teeth; repair of gunshot defects of soft parts and bone with preparation of emergency splints; rib grafts; enucleation of eye.

Demonstration of repair of partial and complete loss of nose and ear by Indian and Italian method. Transplantation of finger to restore nose.

(b) Blood transfusion (3½ hours). Transfusion by citrate method performed on dogs by students in groups of four.

(c) Demonstration of bone grafting (3½ hours). Tibial graft transplanted into jaw defect of dog; technique.

Anesthesia (3 hours).

Lectures detailing precautions necessary and special technique. Insufflation intracheal ether anesthesia, local regional anesthesia (conduction anesthesia, peridental, etc.).

Postoperative care (4 hours).

Inspection of postoperative cases and wounds. Massage and mechanotherapy.

Röntgenology (2 hours).

Interpretation of radiographs showing dental and peridental abnormalities, fracture of jaws, foreign bodies, etc.

Clinical demonstrations (12 hours).

Varying with the material available, mainly consisting of fractured mandibles, operations for repair of defects of soft parts and scar contractures, cartilage and bone grafts, drainage of oral infections.

Extraction of teeth (4 hours). Demonstration.

Making and application of special forms of splints for the dentists (30 hours).

Each dentist constructed and retained for future reference the splints most applicable to the treatment of fractured mandibles. These exercises occupied the morning hours of the dentists for the first 10 days of the course.

At the completion of the first course the curriculum was changed and extended to include the following neurological surgery:²⁹

Neuropathology.

(a) Lectures and demonstrations (4 hours).

(b) Autopsies (6 hours).

Physiology of the nervous system; lectures and demonstrations (12 hours).

Clinical neurology.

(a) Lectures, dispensary, and ward work (23 hours).

(b) Eye and ear (7 hours).

This intensive course dealt in great detail with all aspects of the surgery of the soft and bony parts of the face, jaws, and neck, enabling both the surgeon and the dentist to grasp the manifold problems which would confront him from the time the recently wounded patient required his care to the final period of discharge. The present war surgery appeared to demonstrate that almost miraculous restoration of function and repair of hideous defects with but minor final disfigurement could be attained if the proper measures were immediately instituted and if the subsequent treatment were carried out according to well-defined principles. The course was designed to teach these fundamental and essential facts and to prepare the surgeon for their application in practice.

The first course began October 15, and the fourth, February 11, 1918. The first course covered a period of three weeks. The instruction in the second course for the dentists was completed on November 22, 1917, and instruction for the surgeons was completed on December 7; the later courses covered a period of four weeks. The expenses connected with the running of the school were handled by the Washington University and no bill was presented to the Government.²³

SCHOOL OF PLASTIC AND ORAL SURGERY, UNIVERSITY OF PENNSYLVANIA,
PHILADELPHIA, PA.

This school was conducted at the Thomas W. Evans Museum and Dental Institute of the School of Dentistry of the University of Pennsylvania.²³ A conference was held in the Surgeon General's Office on October 17, 1917, at which were representatives of the University of Pennsylvania and other medical schools and hospitals in Philadelphia and at this conference the course of instruction which had already been established in St. Louis was discussed, after which the facilities of the hospitals in Philadelphia were placed at the disposal of the Surgeon General, for the establishment of a similar course. A school at Philadelphia was authorized by the Surgeon General.²³ Three courses of instruction were completed at this school, the first session beginning November 5, 1917, the second on December 3, 1917, and the third on February 11, 1918.²⁴ The courses were attended by groups of surgeons and dentists, part of the course being arranged for both groups jointly, each group receiving instruction separately on subjects which pertained to that group.²⁴ The following is a synopsis of the courses given and the schedules of instruction by hours for each week in each course:²⁷

SYNOPSIS OF THE COURSE OF STUDY BEGINNING NOVEMBER 5, 1917

Anatomy:	Hours
(a) Dissections (surgeons).....	36
(b) Demonstrations (dentists).....	12
(c) Surgical anatomy lectures.....	4
Infectious processes about mouth, face and neck:	
(a) Mouth infection (bacteriology).....	4
(b) Infections of the neck and face—cellulitis.....	2
(c) Surgical infections of the face.....	1
(d) Infection and treatment of maxillary sinus.....	1
(e) Diseases of mouth.....	3
(f) Diagnosis and treatment of mouth diseases.....	1

Wounds and injuries; evening lectures.

Fractures:

(a) Diagnosis and treatment of old and new fractures.....	Hours 3
(b) Clinic on treatment of old fractures.....	1

Splints: Making and application of special forms:

(a) Lectures and demonstrations (surgeons and dentists).....	1
(Dentists only).....	2
(b) Laboratory work (dentists only).....	28
(c) Wiring, fractures.....	1
(d) Orthodontic bands for fractures.....	1

Operative surgery:

(a) Plastic methods on cadaver lectures and laboratory (surgeons only).....	24
(b) Bone and cartilage grafting on dogs (surgeons and dentists).....	12
(c) Blood transfusion.....	1

Anesthesia:

(a) General anesthesia (ether) }	1
(b) Intratracheal anesthesia }	
(c) Local anesthesia.....	7
(d) Nitrous-oxide and oxygen.....	1

Postoperative care:

(a) Carrel-Dakin method, demonstration and clinic.....	3
(b) Dental hemorrhage.....	1

Roentgenology:

(a) Symposium on dental X ray.....	3
(b) Location of foreign bodies with X ray.....	1

Clinical demonstrations:

Surgical clinics.....	2
Plastic operations on the face.....	2
Hospital clinics (to be announced).	

Extraction of the teeth:

(a) Difficult extractions.....	1
(b) Clinical demonstrations.....	3

Special lectures:

- Evacuation and transportation of the wounded.
- Removal of inspired bodies of a dental nature.

In addition to the facilities of the Evans Institute, lecture and demonstration rooms at the following institutions were at the disposal of the school:²⁷ Jefferson Medical College, Jefferson College Hospital, Medico-Chirurgical College, Medico-Chirurgical Hospital, Medical Laboratory Building, University of Pennsylvania, Philadelphia General Hospital, Pennsylvania Hospital, Temple University, and Hahnemann Hospital.

The instructors for the school were those serving on the staffs of the school and the above institutions.

The first dental course, beginning November 5, 1917, was attended by 17 surgeons, 14 dentists, and 1 bacteriologist; the second course, beginning December 3, 1917, by 16 surgeons and 16 dentists; the third course, beginning February 11, 1918, by 10 surgeons and 19 dentists.²⁶ Upon the completion of the course a report upon the ratings given each officer was forwarded the Surgeon General's Office.²⁶

NORTHWESTERN UNIVERSITY MEDICAL AND DENTAL SCHOOLS, CHICAGO, ILL.

This school was started November 19, 1917, and two courses of four weeks each were given. The following is a synopsis of the instruction:²⁸

SYNOPSIS OF COURSE

	Hours
Work of plastic and oral surgery division.....	1
Anatomy:	
Lectures.....	10
Dissections.....	30
Surgical anatomy and operative surgery:	
Surgical anatomy of the mouth, face, and jaws; cadaver.....	4
Ligation of vessels of the neck, tracheotomy, pharyngotomy, ankylosis of jaw, resection of upper and lower jaw; cadaver—	
Surgeons.....	8
Oral surgeons.....	4
Plastic surgery of the mouth, cheeks, and jaws; cadaver.....	2
Plastic surgery of the nose; cadaver.....	2
Plastics on skin and scars, suturing, transplautation of fat, etc.; cadaver.....	3
Bone and cartilage transplantation, nose and jaws.....	4
Infections and inflammations:	
Focal infections.....	1
Local, of mouth and jaws. Chronic alveolar infections.....	2
Infections involving neck, salivary glands, maxillary sinus (adenitis, cellulitis, glossitis).....	2
Bacteriology of mouth and jaw infections, gas gangrene, tetanus, etc.....	2
Treatment of acute infections of oral region; infections of maxillary sinus.....	1
Syphilis in the Army, and its treatment.....	1
Gunshot injuries and infections:	
Open wounds; injuries to trachea and larynx; physiological saline; Dakin-Carrel method, tincture of iodine, etc.....	2
Blood transfusion; its difficulties, technique of agglutination and hemolysis; laboratory work on dogs by members of the class.....	4
Blood tests in laboratory; blood transfusion.....	4
Foreign bodies in pharynx, trachea, esophagus.....	4
Fractures and dislocations of jaws:	
Treatment; prevention of deformities; lectures.....	3
Prosthetic restorations of nose and mouth parts.....	2
Splint construction (oral surgeons only).....	22
Demonstrations in connection with various clinics—anesthesia:	
General anesthesia; ether, nitrous-oxide and oxygen, rectal, intratracheal.....	2
Local.....	1
Demonstrations in connection with surgical clinics—Roentgenology:	
Lectures; reports of war work.....	2
Demonstrations in dental Roentgenology.....	1
Demonstrations of facial Roentgenology.....	1
Extraction of teeth—clinics.....	2
Clinics:	
Facial surgery.....	20
Oral surgery.....	2
General surgery.....	2
Special lectures on war experiences.....	4
Seminar.....	12

Literature on plastic and oral surgery, published since the war began, including many translations of French and German articles, divided into eight groups as follows: 1. Muscle and fat transplants. 2. Fractures. 3. Bone transplants. 4. Nose. 5. Skin and face

transplants. 6. Neck, larynx, salivary system, hemorrhage, nerve injuries. 7. Ankylosis, infection, injuries of cervical vertebra from the front. 8. Dental procedures.

Total time scheduled for surgeons, 156 hours.

Total time scheduled for oral surgeons, 159 hours.

The first course ended December 15, 1917. Thirty-two officers reported for this class. The second course began March 1, and ended March 30, 1918.²⁸

ARMY DENTAL SERVICE COURSE, NORTHWESTERN UNIVERSITY, CHICAGO, ILL.

In addition to the courses in plastic and oral surgery, the Northwestern University gave a postgraduate course of instruction during the month of February, 1918, called the "Army Dental Service Course."²⁸ Nineteen men took this course, the majority of whom held commissions in the Dental Corps. The course was given at the same time as the regular postgraduate course, and certain of the lectures and clinics were given to the two classes together, while others were separate.

The Army dental service course was planned with the object of giving to those who contemplated entering Army dental service, or who had already received commissions, a review of the field of Army oral surgery in order that they might be prepared to extend their work beyond that of routine Army dental service, as occasion might offer. The high percentage of injuries of the face and jaws called for a large number of men who were familiar with the surgery of those parts, and it was expected that a considerable number of dentists would eventually be placed in position as assistants to general surgeons in the care of these cases, the dentist making splints and prosthetic appliances for the restoration of lost parts. It was the purpose of this course to familiarize the dentist with this field so that he might be qualified to render the best possible service. The schedule for each course filled the hours from 8 a. m. to 5 p. m., and consisted, on the average, of two hours of lectures and six hours of clinics and demonstrations in the various departments each day.

The following schedule represents the course for dentists in splint making:²⁸

COURSE IN SPLINT MAKING BY DENTISTS

Friday, December 7, 1.30 to 4. p. m.—Draw and anneal German silver wire, 100 feet.

Take impressions from Babbitt metal models of case of fracture of the lower jaw, in region of cuspid. Make casts, reconstruct and mount on occluding frame. Wax up for Heath vulcanite splint; invest, pack, and vulcanize.

Monday, December 10, 1 to 4.30 p. m.—Take impressions from Babbitt metal models of case of fracture in region of both cuspids. Make casts, reconstruct and mount on occluding frame. Wax up for posterior band splint; invest, pack, and vulcanize.

Tuesday, December 11, 2 to 5 p. m.—Wire teeth of plaster models of upper and lower jaws (models to be supplied), using 30-gauge annealed German silver wire.

Wire teeth of plaster model of upper jaw to a 16-gauge German silver arch bar; wire teeth of lower jaw in same manner, then wire lower arch bar to upper bar.

Wednesday, December 12, 1 to 4.30 p. m.—Take impressions of upper model. Wax up model of splint with square brass tubing to the buccal of molar teeth on both sides. Invest, pack, and vulcanize. Then fit square brass rod into brass tubes and make wings to extend outside mouth to be supported by attachments to head cap.

Thursday, December 13, 8 to 11 a. m.—Take impressions from Babbitt metal models of case in which one half of the lower jaw is missing and mount on occluding frame with other half in proper relation to upper. Make German silver bands for two lower teeth with German silver flange attached on buccal side to hold lower jaw in proper relation to upper jaw.

Thursday, December 13, 2.30 to 5 p. m.—Finish and polish the vulcanite splints made on Monday, Tuesday, and Wednesday.

Friday, December 14, 8 to 12 a. m.—From Babbitt metal models of case in which anterior lower teeth and bone of chin have been lost take impressions of upper and separate impressions of the right and left lower teeth. Make casts and mount on occluding frame with lower teeth in proper relation to upper. Make German silver bands for two lower teeth on each side and connect with heavy arch to hold halves of lower jaw in proper place.

The second course of instruction began on March 1 and ended March 30, 1918. The schedule was similar to that of the first course.

The course was completed by 13 surgeons and 19 dentists. At the termination of the course the students were classified according to class standing, and reported to the Surgeon General as follows: Surgeons, class A, 6; class B, 6; C, 1. Dentists, class A, 8; class B, 8; class C, 3.

Affiliated institutions, the clinical material of which was available and used in the conduct of this course were: Wesley Hospital, St. Luke's Hospital, Cook County Hospital, Presbyterian Hospital, Augustana Hospital, Frances Willard Hospital, and John Crerar Library.

SCHOOLS OF ORTHOPEDIC SURGERY

After the original personnel of the division of military orthopedic surgery of the Surgeon General's Office was more or less automatically supplied and determined by the enrolling of the available trained orthopedic surgeons, it was quite apparent that this force must be considerably augmented as the demands upon its numbers increased. It was clear that the source of this supply must be found among the younger general surgeons and from a number of the many young practitioners who had already obtained acceptable training along surgical lines. In enrolling and recording the available orthopedic personnel the policy of the division was to depend entirely upon recommendations or personal applications for the first contact with the candidate. When such recommendation or application was received the person recommended or submitting the application was immediately reserved for orthopedic service. An effort was made to verify all statements concerning the experience and qualifications of the applicant and to decide as to his desirability and his adaptability. Those found desirable and available were transferred to this service. It was further evident that in addition to the elementary course in foot affections and care, splint work, and other orthopedic instruction, given at the Medical Officers' Training Camps at Camp Greenleaf and Fort Riley, it would be necessary to give to some of the younger surgeons special instruction in the fundamental principles of orthopedic surgery, in order to train them as assistants in hospitals to serve under qualified orthopedic surgeons. It was finally decided that intensive training in the larger medical centers was necessary.³⁰ In line with these views, early in September, 1917, arrangements were made with the postgraduate department of Harvard University³¹ and with the Post-Graduate Hospital, New York,³² to establish courses of instruction in these institutions, and a definite syllabus of this instruction was prepared. On October 15, 1917, arrangements were made for similar courses to be given in Philadelphia, Pa.³¹ Early in November a standardized course of instruction was determined upon,³³ which was used in all schools. The facilities of the

Army Medical School, Washington, D. C., were offered for special orthopedic instruction, and property adjoining the Army Medical School was leased for this special purpose.³⁴ About this time an orthopedic service was established at Walter Reed General Hospital, and the use of the wards and clinical material was offered in connection with the proposed course established officially through the approval of the Surgeon General.³⁵ The first class under this arrangement entered upon the course on November 12, 1917. Other schools were established, following the same plan and schedule of instruction at the following places: Oklahoma City, Okla.; Chicago, Ill.; and Los Angeles, Calif.³⁰

The teaching staff of these schools was composed of physicians, most of whom were not in the service.

HARVARD UNIVERSITY GRADUATE SCHOOL OF MEDICINE

Courses of instruction in orthopedic surgery which were given at the Harvard Medical School and the large hospitals in Boston began in September, 1917,³⁶ and continued until after the armistice, the last class beginning on November 1, 1918.³⁷ Several officers reported for the December class before it was decided to discontinue the regular courses, but arrangements were made to give them special instructions in orthopedic surgery.³⁸

The courses, as originally planned after the first trial course of four weeks, were intended to cover a period of six weeks,³⁹ but were extended to eight weeks in the winter of 1917-18, and were reduced again to one month in the summer of 1918, when the demand for orthopedic surgeons became more urgent.⁴⁰

The following instructions for the guidance of the students in their work in the schools, and in the rendering of reports, were issued by the Surgeon General, in April, 1918:⁴¹

INSTRUCTIONS TO MEDICAL OFFICERS ATTENDING COURSES OF INSTRUCTION IN ORTHOPEDIC SURGERY AT HARVARD GRADUATE SCHOOL OF MEDICINE

1. It is required that all necessary reports be promptly made out and forwarded through proper channels.

2. It is expected that all officers in attendance in this course will be prompt in attendance, and a report will be required in case of lateness or of absence.

3. A course being given in cooperation with a civilian institution, it is expected that the greatest possible care will be taken in relation to the laboratories, libraries, etc. This is particularly true as regards the anatomical department, where the observation of the following rules is imperative.

(a) Subjects must be kept covered when not in use, and steps taken to prevent drying.

(b) Subjects must be kept on blocks at all times to prevent maceration of dependent parts.

(c) Put seraps in the pail provided for that purpose.

(d) Greatest care must be used in handling frozen sections; these must not be dissected.

(e) Frozen sections must be returned to boxes in order after using.

(f) All material must be used with greatest care.

(g) Rooms must be kept clean and orderly at all times.

(h) The above rules will be strictly enforced.

4. The course is under military supervision and the usual formalities will be observed.

5. Inattention and lack of interest will be made a matter of record and forwarded to this office by those responsible for the instruction. Helpful suggestions regarding the conduct of the work will be appreciated and should be made subjects of communications which will be forwarded through the proper channels.

*

*

*

The following is an abstract from a general outline of instruction, suggested by the Surgeon General, for use as a guide to those conducting the courses at these special schools:¹²

* * * * *

This course includes instruction in the fundamentals of orthopedic surgery, particularly as related to the military service, including review of the correlated anatomy, particularly of joints, muscles, and nerves, and a course on brace making and fitting. The following general outline of this course suggests the scope of the instruction for those who have had general surgical training, but no special orthopedic training.

I. This course will be confined to work preparatory to assignment to reconstruction hospitals and will include:

- (1) Operative surgery, plaster, shop, and gymnasium.
- (2) Work in out-patient departments, and wards of large hospitals, supplemented by lectures bearing on reconstruction and plaster work.
- (3) Materials used in reconstruction work and their application, touching on making, keeping, handling, and application of plaster bandages.
 - a. Substratus of plaster, flannel, stockinet, and wadding.
 - b. Reinforcement of plaster casts with plaster, wood, wire, and iron.
 - c. Bracketing and making of removable dressings. Demonstrations of various methods of fixation; dressings allowing regular inspection of wounds.

II. Regional application of dressings, splints, braces, etc., to the spine and each of the joints with special reference paid to positions of fixation and methods to be used in the field hospitals.

III. Methods of mechanical control:

- (1) Immobilization in recumbency and ambulatory.
- (2) Compression, indications for—
 - a. Stilting.
 - b. Traction, methods for recumbent and ambulatory.
 - c. Permanent dressings for treatment after operations of bones, joints, muscles, and tendons, with attention paid to position of fixation, in various conditions.
 - d. Removable dressings to permit manipulation, massage and inspection, heliotherapy, etc.
 - e. Apparatus specially made for, and the improvization of apparatus for complicated conditions, and the mechanics of these forms of apparatus; special treatment of conditions and applications of apparatus and splints to the shoulder, elbow, wrist, hand, hip, knee, ankle, and foot.
 - f. Course in making removable dressings in plaster of Paris, cast splints improvised combinations of plaster, wire, steel rods, and wire gauze.

IV. Braces: Typical orthopedic braces made of leather, celluloid, aluminum, and combinations thereof, adhesive plaster strappings, and the conditions met by these; wadding dressings for restraining motion causing pressure.

V. Orthopedic operations:

- (1) Osteotomies, bone sutures, grafts, etc.
- (2) Joints, normal operations of joints such as excision and arthroplasty are not to be taught in this course on account of their extreme seriousness.
- (3) Muscles and tendons; tenotomy, tendon transplantation and tendon implantations, with the conditions indicating their employment will be taken up and the suture of nerves with the subsequent treatment and the cases of this character will be gone into.

VI. Manipulative Methods: Questions of forcible movements of joints to loosen adhesions and stretch shortened tissues will be taken up and for the most part condemned, with emphasis on precautions. Mechanics of reducing malunited and unreduced fractures without apparatus touched upon.

VII. Ward demonstrations which will have mostly to do with diagnosis and prognosis.

VIII. Physical therapy which will touch upon hyperemia by various kinds of heat, and other methods of obtaining hyperemia, massage, passive movements, resisted movements, etc., with a course in therapeutic exercises, hydrotherapy, electrotherapy, and heliotherapy. Special attention will be given to the indications for, and application of electrotherapy and hydrotherapy.

IX. Vocational reeducation: This course is planned with the idea of laying stress on kinds and percentages of disability, and ability on part of crippled men to perform certain occupations, and consideration of courses of instruction necessary for the reeducation of individuals disabled from military duty.

X. Special anatomy in relation to reconstruction work in orthopedic surgery will be given attention in addition to stress to be laid on the principles of orthopedic surgery.

XI. Principles and applications of hydro, and electro therapy; mechanical technique.

Upon the completion of this course, the officers will be detailed to the medical officers' training camps, for training in military hospital administration in a course already provided by the Surgeon General. From these camps the officers will be assigned as attending orthopedic surgeons to various Army training camps, to the United States hospitals, or for the special training in military orthopedic surgery in England, after which the officers may be transferred to France.

* * * * *

In addition to the intensive instruction in the fundamental principles of orthopedic surgery given at the above-mentioned institutions, some of the men who had attended the above courses, and others in small numbers, were given further instruction in orthopedic hospitals under orthopedic surgeons of experience, for the purpose of developing them for more specialized positions.³⁰

SCHOOLS OF NEUROSURGERY

On August 24, 1917, at a conference of the advisory board of the subsection of brain surgery, it was agreed that in order to carry out the Surgeon General's plan of having this subsection represented in each base, cantonment, and evacuation hospital, approximately 250 surgeons would be required,⁴³ and that in addition to these approximately 40 surgeons would be required for the proposed hospital for surgery of the head.⁴³ It was proposed, therefore, to establish definite schools of instruction for the special training of skilled surgeons in this particular branch of surgery. A committee was appointed to select locations for the schools and to outline the courses of instruction. Philadelphia, New York, Chicago, and St. Louis were selected as locations for the schools.⁴³

The courses of instruction included anatomy and physiology of the nervous system, clinical studies, and a careful survey of the literature of brain surgery for the period of the war to date.⁴³ The first course was begun in the University of Pennsylvania on September 17, 1917, and extended over a period of four weeks. At a meeting of prominent neurological surgeons in the Surgeon General's Office, on October 5, 1917, it was recommended that the course of instruction be extended to three months for the following reasons:⁴⁴

(1) The small number of available trained neurological surgeons; (2) the present course of four weeks in progress at the University of Pennsylvania had aroused the interest of the neurological surgeons sufficiently to cause them to take further instruction in neurology; (3) the intensive training given in the first four weeks with emphasis upon neuroanatomy, physiology, and symptomatology of diseases of the nervous system furnishes an excellent foundation upon which to build a more thorough knowledge of neurology; (4) Surgeons classified in the division of brain surgery are not needed in France at this time, and it seems advisable to

have them continue in active service, furthering their knowledge of neurology. It is also recommended that these surgeons be assigned to military camps for the necessary military instruction; (5) to prepare a group of brain surgeons by October 1 for the proposed neurological schools in the war zone. It is further recommended that this clinical instruction be carried on under the direction of a member of the class who shall be designated as director and whose duty it shall be to assign, with the cooperation of this office, to the different neurological clinics of a given city, as many men as can be instructed. It is suggested that the hospitals for the care of chronic neurological diseases, neurological divisions of out-patients departments, large accident wards, etc., be considered the chief source of clinical material.

It is also recommended that large neurological laboratories be supplied with men capable of special training in this line, so that the division might have listed a number of surgeons capable of caring for neurological material in the laboratories.

* * * * *

It is further recommended that this plan be instituted in Philadelphia at the completion of the present course at the University of Pennsylvania on October 13.

These recommendations were approved by the chief of the section of surgery of the head on October 18, 1917, and schools were organized in the cities mentioned.⁴⁴ Letters were sent to directors of all hospital units to nominate candidates for these courses. The directors were given to understand that the candidates would be returned to their units on completion of the course of instruction, or in case the units were ordered overseas prior to the completion of the course. The courses were later changed to cover a period of 10 weeks.

After the directors of the schools had been appointed, letters were written by the chief of the division of head surgery to the leading hospitals and universities of the cities in which the schools were located, requesting their cooperation and assistance in the operation of the schools.⁴⁵ Letters were written to the commanding officers of military officers' training camps, cantonments, base, evacuation, and post hospitals, asking for nominations to take the courses of instruction in these schools. The student body was made up of selections from those nominated from these organizations, together with nominees in civil life, commissioned in the Medical Reserve Corps and ordered direct to the schools.⁴⁶ Adjutants were selected from the student body to assist the director in the preparation of returns, reports, etc.⁴⁶

These neurosurgical schools were administered with the sole object of training medical officers to approach neurosurgical problems from the standpoint of the neurological surgeon, and to develop in them habits of neurological thought, so that they would be able to interpret symptoms and apply their knowledge to the neurosurgical problems which they were certain to encounter whether in a cantonment, base or evacuation hospital, or in a first-aid dressing station. For this purpose the neurological surgery of civil life was presented from both the neurological and the operative sides. To this was added much of traumatic surgery of the central and peripheral nervous system which was derived partly from the material in civil and partly from that in Army hospitals. The attempt was made to give the student officers sufficient training to make them able to recognize the nature of an injury to the nervous system, to determine the location of the injury and to decide upon the indications for or contra-indications to operative treatment. The technique of operative treatment was considered in special surgical lectures and was demonstrated on the cadaver and on the living patient in the operating room, and special attention was paid

to the latest principles of treatment of brain, spinal cord, and peripheral nerve injuries that were reported from the war zones. The courses were planned to give the officers, through lectures and clinical demonstrations, by the individual study of the anatomy, histology, and pathology of the nervous system on the cadaver and through the microscope, a thorough knowledge of the anatomy and physiology of the nervous system, followed by lectures, demonstrations, and individual clinical work in neurology, neurosurgery, and in the essentials of ophthalmology, otology, psychiatry, and Roentgenology with which the neurosurgeon should be acquainted. In all the teaching, this aim was kept constantly in the foreground. It was clearly recognized, also, that the actual practical training could be obtained only from experience and work at the front.

It was not always possible to assign each group of officers to the school at the beginning of each session; at times the exigencies of the service made it necessary to assign officers to the school a number of weeks after a session had begun.⁴⁷ The courses were so arranged, however, that officers who had come late continued their studies in the succeeding course, so that they obtained a complete training of 10 weeks, just as if they had been present from the beginning of a session. During the intervals between sessions there were operative clinics and clinical demonstrations in some of the schools, so that the time of the officers who were held over from one session to the next was fully occupied.

Although subservient to the professional aims of the courses, the military duties and responsibilities of the officers were kept before them in most of the schools through regular systematic military drill and setting-up exercises and the explanation of the more familiar and usual official forms and regulations.

The school conducted at the University of Pennsylvania, as stated, was the first to be organized. The outline of the course of instruction given in this school is selected as typical of the work conducted in the other neurosurgical schools.

SCHOOL OF NEUROLOGICAL SURGERY, UNIVERSITY HOSPITAL, PHILADELPHIA, PA.

This school was organized in compliance with instructions from the Surgeon General of the Army.⁴³ The first course of instruction began on September 17, 1917, and terminated on October 22, 1917. The number of students taking the first course was 32. The second course began on October 23, 1917, and was completed December 29, 1917. It was composed of 27 students. The third course began on January 7, 1918, and was completed March 16, 1918, 25 in attendance.

COURSE OF TRAINING FOR NEUROLOGICAL SURGEONS, UNIVERSITY OF PENNSYLVANIA SCHOOL⁴⁸

The instruction will be divided into three groups: (a) Didaetic course; (b) laboratory course; (c) clinical course.

They should comprise the following groups: (a) Anatomy; (b) physiology; (c) pathology; (d) operative surgery on the cadaver; (e) animal surgery; (f) clinical neurology; (g) operating room technique.

It is estimated that by intensive work the course can be covered in four weeks, divided as follows: Morning (1½ hours)—anatomy, 15 lectures; physiology, 9 lectures; operative surgery, cadaver, 14 lectures; pathology, 6 lectures; animal surgery, 4 lectures. After-

noon (1½ hours)—clinical neurology, lantern slides, lectures, and assignments. (The remainder of the afternoon to be given up to presentation of cases in various hospitals.)

The various courses will cover, in general, the following:

(a) Anatomy: Scalp, skull, brain, with its various sections and the tracts in general. Subarachnoid space, circulation of the cerebrospinal fluid. The vertebral column. The cord with its segments and the plexuses and nerves. The circulation of the brain and cord.

(b) Physiology: Contemplates the complete discussion of localization, reflexes, nerve degenerations, and stimulations, etc.

(c) Pathology: (1) gross, a consideration of hemorrhage, abscess formation in the brain with the presentation of material demonstrating and emphasizing localization; method of the preservation of material; cord and spinal column, presentations of fracture and dislocations of the discussion of concussion, contusions, hemorrhage, etc. (2) Microscopic studies of nerve injuries and nerve repair.

(d) Operative surgery on the cadaver: This course in a combined didactic and laboratory course, one-half hour to be given to discussion of technique and one hour to operations on the cadaver, covering the following: Scalp wounds, clean and infected; osteoplastic flaps and treatment of hemorrhage and fracture; technique of decompression, dual incisions; brain puncture; ventricular puncture; brain exploration; dural closure; scalp closure; bone transplant; fascial transplants; fungus, cerebri; foreign bodies; technique of lumbar puncture, technique of laminectomy.

(e) Animal surgery: Consisting of operations on the dog; of nerve suture, brain hemostasis, laminectomy.

(f) Clinical neurology: This course is carried on by the aid of neurologists, consisting of lectures, lantern slides discussions, demonstrations of patients, covering the following: Methods of examination and history writing, the spinal fluid localization of foreign bodies, neurologic and X ray.

Diagnosis: Symptomatology and treatment, brain hemorrhage, concussion, fractures of the skull, abscess of the brain, meningitis, gunshot injuries of the brain and cord, fracture of the spine, cord injury, complete and incomplete nerve injury.

In connection with this course use will be made of the material collected by Major Tarnowsky and Major Seelig who are working on collection of literature of the war.

(g) Operating room technique and presentation of patients.

This outline was followed during the first course of four weeks, but was elaborated for the succeeding courses, which were extended in duration and in work.

The following method of classifying the students at the close of the course was employed: Group 1, those competent to operate, themselves, in neurological work. Group 2, those useful as assistants. Group 3, those suitable for assignment to courses of instruction in cantonment hospitals. Group 4, those not eligible for any of the above groups.

NEUROLOGICAL SCHOOL, PRESBYTERIAN HOSPITAL AND ALLIED INSTITUTIONS,
CHICAGO, ILL.

Two courses of instruction were given at this school.^{44 49} The first course began on November 1, 1917, and terminated on January 11, 1918.⁵⁰ The number of students in the class was 27. On completion of the course the students were ordered to the following camps: Bowie, Beauregard, Doniphan, Hancock, Lee, Logan, MacArthur, Sevier, Shelby, Taylor, Fort Oglethorpe, and Fort Riley. From November 1 to November 23, inclusive, the course consisted of lectures and laboratory work given at the University of Chicago. From November 24, 1917, to January 11, 1918, inclusive, the work was chiefly clinical and was given at the Presbyterian Hospital, Cook County Hospital,

and St. Luke's Hospital. In addition to this, pathological demonstrations were made in the pathological laboratory; operative surgery on the cadaver was done in the anatomical laboratory of Rush Medical College, and post-mortem examinations were held in the Cook County morgue. Once a week a seminar was held by the members of the class.

The second course of instruction began on January 15, 1918, and was terminated on March 25, 1918.⁵¹ The instruction was similar to that given in the first course. Eleven students composed the second class, and upon the completion of the course they were ordered to the following camps: Bowie, Cody Custer, Grant, Lee, MacArthur, Pike, Sherman, and Travis.

NEUROSURGICAL SCHOOL, NEW YORK CITY

This school, which was the largest of the neurosurgical schools, was organized at the Neurological Institute, New York City. The following hospitals and colleges in New York City cooperated in the organization of the school:⁴⁷ The Presbyterian Hospital; Roosevelt Hospital; New York Hospital; St. Luke's Hospital; Mount Sinai Hospital; Bellevue and allied hospitals; Columbia University; College of Physicians and Surgeons, New York University; and Bellevue Hospital Medical School.

Five courses were held as follows: First, December 3, 1917, to February 8, 1918; second, February 18, 1918, to April 26, 1918; third, May 6, 1918, to July 13, 1918; fourth, July 29, 1918, to October 5, 1918; fifth, October 14 to December 21, 1918.⁵² The first class was composed of 25 students; the second, 30; the third, 19 new men and 7 who remained over from the previous class for further instruction; the fourth, 25; and the fifth, 19.

The method of classifying the students at the completion of the courses of instruction was as follows: Two groups were formed: (*a*) Those capable of doing independent neurosurgical work; (*b*) those fitted for assistants. Each group was again divided: A+ meaning first class and A- meaning not quite so good; B+ meaning those who, under a certain amount of guidance, might be able to do good independent work; B- representing men who were fitted to act only as assistants.

COURSE OF INSTRUCTION IN NEUROSURGERY IN THE SCHOOL OF NEUROLOGICAL, PLASTIC, AND ORAL SURGERY, ST. LOUIS, MO.

One course of instruction in neurosurgery was given to a class of 36 students beginning November 3, 1917, and extending over a period of five weeks.²⁹ This course was given by the same instructors and at the same time that the second course in oral and plastic surgery was given in this school (see *Schools of Plastic and Oral Surgery*, p. 531). The following is a synopsis of the course in neurosurgery:

THE OBJECTIVE

I. To teach the correct interpretation of neuropathic symptoms: (*a*) As presented in shell shock; (*b*) in injuries to the brain and spinal cord; (*c*) in the early detection of cerebral hemorrhage and hemorrhage into the spinal cord; (*d*) the proper methods of eliciting reflexes and the differentiation of organic from functional nervous conditions; (*e*) the Bárány tests as an aid in the localization of intraeranian lesions; (*f*) the diagnostic value of the relation of intracranial pressure to general arterial pressure.

II. Head surgery: (a) The proper care of fractures of the skull and spinal column; (b) the advantages of early relief of pressure in hemorrhage into the brain and cord; (c) the dangers of permanent destruction of the nervous elements of the brain and cord incident to edema and hemorrhage; (d) the demonstration of operations designed to relieve pressure; namely, trephining, decompression, and laminectomy; (e) the care of the dura and the prevention of meningeal infection.

COURSE

Neuropathology (10 hours): (a) Lectures and demonstrations (4 hours), showing pathological brains and several specimens showing the effects of accidental injuries. Brain abscess, hydrocephalus internal and external, and brain tumors were considered in detail, with a full elucidation of the underlying principles of stimulation of the respiration by the intravenous use of hydrocyanic acid. (b) Autopsies (6 hours).

Anatomy of the nervous system (10 hours): Course covered a complete and detailed dissection of the brain and spinal cord tracts.

Physiology of the nervous system (12 hours): (a) Lectures and demonstrations upon the dog with the necessary instruments of precision, showing the relation of intracranial pressure to the general arterial pressure and the blood supply to the vital centers of the brain and accounting for some of the phenomena which accompany fractures of the skull and injuries to the brain and spinal cord. (b) Detailed description of the motor and sensory pathways of the spinal cord and internal structure of the brain.

Clinical neurology (78 hours): (a) Lectures, dispensary work, and ward walks (18 hours), going over brain and cord lesions, demonstrating reflexes, and tracing the motor and sensory paths. (b) Examination and diagnosis of new cases in the dispensary (16 hours). (c) A full discussion of the post-traumatic neuroses, and the differential points between Jacksonian and idiopathic epilepsy. (d) Operative clinics, showing the technic of operations, namely, trephining, resection of the Gasserian ganglion, three laminectomies, one after injury, suture of the ulnar nerve, lumbar and ventricular puncture in hydrocephalus, tumor of the pituitary, subsellar and suboccipital decompression, the use of acacia and sodium bicarbonate in the treatment of shock, and the arrest of hemorrhage by the use of bone wax and fresh muscle (44 hours). (e) Demonstration of craniocerebral topography on the monkey. (f) Student officers performed in the laboratory—trephining, decompression and osteoplastic decompression on the cadaver, and decompression and laminectomy on the dog.

Eye and ear (14 hours): (a) Demonstration of all the various methods employed in testing hearing. (b) The Bárány tests of the vestibular apparatus in relation to the diagnosis of intracranial lesions discussed fully in lectures and in dispensary. A thorough exposition of the clinical significance of the eye-pull, past pointing with both arms and trunk, and of spontaneous and induced vertigo, together with the technic of application of the tests was given. Class divided into sections to insure individual instruction in the technique of the work (7 hours). (c) Examination of the eye by direct and indirect ophthalmoscopy, with particular stress laid on the recognition of incipient choked disk, differential diagnosis between choked disk and optic neuritis, optic atrophy, and other pathologic eye grounds. Variations in intraocular tension from disease or injury were fully discussed (7 hours).

The seminar (14 hours): All references pertaining to this course in French, German, and English, taken from the list issued by the Surgeon General's Office, read, briefed, and reported upon at seminar. Also the book, *War Surgery of the Nervous System*, was divided into sections and reported by the student officers at the seminar.

Résumé: This intensive course deals with the all important subject of fractures of the skull and spinal column and the brain and cord lesions incidental to the same. As the writers on these subjects, who are working in the war zones, give many conflicting views and have set down certain facts which are really modifications of former principles of surgery, such modifications being due to circumstances incidental to warfare, it has been necessary in this course to reconcile divergent opinions expressed and to accentuate the accepted teaching on the following mooted points: (1) The indications and contraindications for the removal of fragments of bone, missiles, and other foreign substance from the brain. (2) The indications and contraindications for immediate surgical interference, the question of early closure of wounds not contaminated, and the prevention of sepsis. (3) The contraindications for drainage of brain

tissue, the correct method of drainage where the indications are absolute for same, and the prevention of hernia cerebri. (4) The indications for sufficiently prolonged care at the evacuation hospital and the extreme contraindications for moving of head cases. (5) The indications and contraindications for lumbar puncture in head injuries.

SCHOOLS OF MILITARY ROENTGENOLOGY

At the time the United States entered the World War, little preparation had been made for the use of the X ray in the Army under war-time conditions, and the number of qualified Roentgenologists available for service in the Army was inadequate for the contemplated needs.⁵³ The American Roentgen Ray Society had realized these facts for some time previous to the declaration of war, and a committee on preparedness had been appointed by the society for the purpose of studying the problem and outlining the action to be taken in case the United States was drawn into the war. Through the activities of this committee a list of the practicing Roentgenologists in the United States was compiled and considerable correspondence and propaganda were carried on for the purpose of interesting Roentgenologists, in civil practice throughout the country, in the military service. A canvass of the United States revealed the fact there were in the United States at the beginning of hostilities less than 300 trained Roentgenologists, and of really expert men probably not more than 100. It was recognized, therefore, that the problem must be solved by the institution of training having a scope broad enough to produce the necessary number of Roentgenologists sufficiently trained to do military Roentgenology, and of inducing medical men in sufficient numbers to enter the service with a view to their training as military Roentgenologists.

Soon after the United States entered the war the Surgeon General assigned a specialist in Roentgenology to his office and placed him in charge of all X-ray activities of the office.⁵⁴ In order to meet the problems mentioned above, this officer, in cooperation with the committee on preparedness of the American Roentgen Ray Society, immediately took under consideration and completed arrangements for the establishment of a central school of Roentgenology at Cornell University Medical College, New York City, with sections in Boston Mass.; Philadelphia, Pa.; Baltimore, Md.; Richmond, Va.; Pittsburgh, Pa.; Chicago, Ill.; Kansas City, Mo.; and Los Angeles, Calif.⁵⁵ These schools were placed under the direct control of the War Department and the trained Roentgenologists in charge of them were commissioned in the Officers' Reserve Corps.⁵⁶ Student officers in groups of 10 were assigned to the various schools. Upon the completion of the courses of instruction those destined for foreign service were ordered to New York for final examination and further instruction before any were ordered overseas, and others were ordered to camps and hospitals in the United States.

The curriculum decided upon was tentative, it being realized that it was impossible to attempt to provide Roentgenologists with broad training and extensive clinical experience in any reasonable length of time. It was decided, therefore, to concentrate the teaching upon the essentials, both physical and medical, so that the students would be well grounded in the physics of radiant energy; familiar with the apparatus for the production thereof and its troubles and the remedies to be applied; skilled and well trained in the essential methods

of localization of foreign bodies in the human anatomy, and the methods for transferring such information to the surgeon; and having as much experience as it was possible to obtain in the short time allotted in the diagnosis of fractures, dislocations, and human pathology other than surgical. It was further decided that the exigencies of the situation would not permit of a longer period of instruction than three months, to be followed by a short post-graduate course in the school at New York, to be devoted to a review of localization methods and machine instruction.⁵⁷

The course of instruction, which was both didactic and practical, embraced the following subjects:⁵⁷ (1) Roentgen physic; (2) practical working knowledge of all types of X-ray apparatus, including wiring of machines, trouble finding, and charting transformers; (3) principles and use of both gas and Coolidge X-ray tubes; (4) use of the fluoroscope; (5) construction and outfitting of a dark room as well as developing and other necessary dark-room technique; (6) plate making, including both exposure time and position of patient for various types of examination; (7) Roentgen anatomy; (8) interpretation of plates, including the normal, variation from the normal, and pathological conditions; (9) systematic record keeping, including marking of plates, recording interpretation of same, as well as the method of imparting this information in a short, concise, intelligent manner to the surgeon; (10) localization of foreign bodies by all approved methods; (11) handling of patients in a rapid, efficient manner.

Instruction began in June, 1917, and by September 1, all the schools were in operation.⁵⁷ These schools continued in operation until the early part of the year 1918, the last school, with the exception of the one in New York, closing March 1, 1918. The number of officers given instruction in these schools, with the exception of the New York school, averaged between 25 and 30.⁵⁸

The main object of the school, during the latter part of its existence, was the completion of the preliminary training given at the schools at Fort Riley and Camp Greenleaf.⁵⁷

The following is a summary of the personnel who received instruction at the New York school:⁵⁹

Officers of the Medical Corps (regular course).....	244
Officers of the Medical Corps (2 weeks course).....	58
Officers of the Sanitary Corps.....	23
Enlisted men, Medical Department.....	75
Officers of the United States Navy and Public Health Service.....	11
Supplementary course of instruction to Roentgenologists of experience.....	11
Total.....	422

SCHOOL OF MILITARY ROENTGENOLOGY, CORNELL UNIVERSITY MEDICAL COLLEGE,
NEW YORK CITY

This school was opened June 9, 1917.⁵⁹ In June, 1918, it was partially dismantled, much of the apparatus being sent to the Medical Officers' Training Camp, Camp Greenleaf, for use in its school of military Roentgenology. The teaching force, likewise, was greatly depleted, its members being ordered to overseas service, or to Camp Greenleaf, to assist in the conduct of that school

of military Roentgenology.⁶ It continued, however, to carry on instruction in methods of localization, and to provide clinical experience in the various New York hospitals for men awaiting orders at the port of embarkation.⁶ In the fall of 1918, when a great shortage of Roentgenologists suddenly arose, due to the unexpected call for an increased number of hospitals for overseas service, the capacity of the New York school was augmented for the purpose of assisting in meeting this emergency.⁶⁰ The school was finally closed January 21, 1919.⁶¹

Quarters for the school were tendered gratuitously by Cornell University Medical College;⁵⁹ the transformers, Roentgenoscopes, tubes, stands, and other apparatus were supplied, without cost to the Government, by the manufacturers;⁵⁷ the facilities of the Edward N. Gibbs Memorial X-ray Laboratory, University and Bellevue Medical College, were placed at the command of the Surgeon General for use in connection with the school,⁵⁹ and clinical facilities were offered by the various hospitals of the city.⁵⁷

SCHOOLS OF UROLOGY AND DERMATOLOGY

The number of men with adequate training in urological surgery, venereal diseases, dermatology, and syphilis was found to be insufficient for meeting the needs in base hospitals and the large camps. It was decided, therefore, to create opportunities for the younger men who might elect to do so to receive post graduate instruction in these subjects. To this end, schools for medical officers were established, in the autumn of 1917, in New York, at Columbia University, in conjunction with Vanderbilt Clinic; in Boston, at Harvard Medical School, in conjunction with Massachusetts General Hospital and Peter Bent Brigham Hospital; in St. Louis, Mo., at Washington University Medical School, with clinics at St. Louis City Hospital, Barnes Hospital, and Barnard Skin and Cancer Hospital.⁶² These schools were discontinued in the spring of 1918, all instruction in urology and dermatology being concentrated at the Medical Officers' Training Camp, Camp Greenleaf, Fort Oglethorpe, Ga.⁶³

The courses were intended to cover a period of four weeks, and this applied to the first, but the second and third courses were extended to cover a period of six weeks each.⁶⁴

Approximately 85 officers were detailed to take the courses.⁶⁵

The following syllabus of instruction of the course given at the Boston school, from February 1 to March 15, 1918, represents the scope of the instruction given the other schools:⁶⁶

SYLLABUS—INTENSIVE COURSE IN DERMATOLOGY, SYPHILIS, AND GENITOURINARY DISEASES A. DERMATOLOGY

(Monday, Wednesday, Friday, 9 to 12 a. m., Massachusetts General Hospital)

I. Lectures (11 hours): (1) The principles of dermatology; their practical application to diagnosis and treatment (anatomy, pathology, etiology, physiology).

(2) Common diseases—inflammations (eczema, urticaria, dermatitis, d. calorica, d. venenata, d. artificialis (malinering)).

(3) Common diseases due to bacteria (impetigo, furunculosis, erysipelas, tuberculosis, anthrax).

(4) Common diseases due to parasites (pediculosis, scabies, ringworm of groins, straw itch).

(5) Common diseases—infectious, contagious (the exanthemata).

(6) Diseases of the foot—affecting efficiency (hyperidrosis, clavus, callositas, verruca, pernio, erythromelalgia, and allied conditions causing pain).

(7) Systematic conditions and external manifestations (fatigue, toxemia, vasomotor disturbances, the kidneys, the digestive tract, disturbed metabolism).

II. Laboratory lectures and demonstrations (10 hours): (1) Pathological methods; pathological diagnosis (pathologist to Massachusetts General Hospital; 6 hours). The technique of obtaining, preserving, mounting, and staining; the microscope and its use; relationship of clinical signs and symptoms to the pathology; illustrations by demonstrations and by the exhibition of slides.

(2) Skin test methods (2 hours).

(3) How to use the pharmacopœia (2 hours). Exhibition of drugs and forms of external applications; demonstration of the value of the percentage column; emergency pharmacy, how to use what is at hand; practical pharmaceutical hints.

(4) The clinical use of the laboratory in daily practice. (In connection with the daily exercises in clinical work.)

III. Clinical lectures (16 hours): (1) On the topic of the lectures in I and II (5 hours).

(2) On the exanthemata—at Boston Hospital for Contagious Diseases (3½ hours).

(3) The relation of disease of the skin to systemic conditions (1 hour).

(4) The organization and conduct of a skin clinic (one-half hour).

(5) Organization, equipment, and conduct of a skin hospital (one-half hour).

(6) Nursing in diseases of the skin (1 hour).

(7) Dermatologic therapy—various (2 hours). (Light therapy; heliotherapy; hydrotherapy; radium; refrigeration; instruments.)

(8) Ward visits.

IV. Clinical work (15 hours): (1) In the out-patient department. History taking; notes and note making; methods of examination; diagnosis, laboratory work in the out-patient department; treatment of patients; the use of instruments and apparatus in treatment; practice as executive assistant; case study; research.

(2) In the ward. Observation of disease progress; studies in diet; in metabolism; case examinations; intensive study of assigned cases; preparation of case reports; records and record keeping; cytology, stool examinations; routine of the ward medical officer; experience in nursing; methods of application of treatment, dressings.

(3) In the daily use of notebooks. Records of each day's work and experiences; of each day's problems and questions; of suggestions received; of all matters of interest encountered; to be kept and to be used in directing home studies and in connection with all class exercises.

V. Class exercises (5 hours): (1) Conferences. For the presentation by the student to the class of prepared case reports and for the demonstration of the cases reported.

(2) Colloquia. Held at intervals, for the purpose of a general review of the course work, for the reading of notes taken, for the presentation of problems and for the asking of questions, for the purpose of a general, informal discussion of everything in which students and instructors may have opportunity to get closer together.

The plan of this course contemplates the acquisition of the greatest possible clinical experience by the student.

It is intended that the instructor shall lay a sure foundation by his lectures but shall otherwise interfere as little as possible.

Under the instructor's supervision, the student will perform all clinical and laboratory work himself, in every exercise, whenever possible.

That no problem may remain unsolved and that the inaccuracies of memory may not interfere, the student is expected to enter the facts in his notebook at the time and, later, to present them at the class exercises.

A series of colloquia has been provided for to which the student may bring his problems and questions for informal discussion.

These informal class meetings are expected to do much in smoothing the way for the student, in promoting interest and zeal and in bringing student and instructor to more intimate understanding.

The outcome depends upon the freedom with which the student utilizes the invitation and opportunity.

B. SYPHILIS

(Tuesday, Thursday, Saturday, 9 a. m. to 12 m.; Massachusetts General Hospital)

I. Lectures; clinics (26 hours): (1) Syphilis (6 hours).

(2) Eye syphilis (3 hours). Lecture; clinic.

(3) Bone syphilis; exhibition of museum specimens (1 hour).

(4) X-ray diagnosis (X-ray department, Massachusetts General Hospital; 5 hours).

Demonstration of methods; of diagnosis; clinics.

(5) Syphilis in surgery (1 hour).

(6) Syphilis of the throat (3 hours). Clinical lecture and demonstration of cases.

(7) Syphilis of the ear (3 hours). Clinical lecture and demonstration of cases.

(8) Visceral syphilis (1 hour).

(9) Syphilis of the spinal cavity (3 hours). Lecture and demonstration of spinal puncture and injection.

II. Laboratory exercises (6 hours): (1) The microscope in diagnosis (4 hours). (a) Dark-field microscopy; (b) staining of spirochaeta; (c) detection.

(2) The Wassermann test (Pathological laboratory of Massachusetts General Hospital; 2 hours).

III. Clinical exercises (16 hours): (1) Clinics (5 hours).

(2) Therapeutic clinic (3 hours).

(3) Salvarsan administration (5 hours).

(4) Diagnosis (3 hours).

All lectures on syphilis and on special topics will be fully illustrated by cases and clinics.

The students will be afforded every opportunity for studying disease manifestations, for diagnosis and treatment, for the laboratory detection of the spirochaetae and for the studying the Wassermann test by means of clinics and clinical work and by means of special laboratory exercises.

C. GENITOURINARY DISEASES

I. Lectures (30 hours): (1) Methods of examination; urinalysis.

(2) Ureteral instruments; asepsis and use.

(3) Cystoscopes; construction and use; urethral catheterization.

(4) Physiology of kidney; methods of estimating renal function; their importance and limitations.

(5) Acute gonorrhea.

(6) Chronic gonorrhea, prostatitis; vesiculitis.

(7) Treatment of gonorrhea.

(8) Stricture of urethra (2 hours).

(9) The prostate.

(10) Prostatism (2 hours).

(11) Renal infections (3 hours).

(12) Calculi, renal and ureteral; pyelography.

(13) Tuberculosis of bladder.

(14) Tuberculosis of genital tract.

(15) The kidney: Tumors, hydronephrosis, cysts.

(16) The kidney: Malformations; injuries; idiopathic hematuria.

(17) The bladder: Tumors, diverticulæ, malformations, wounds; result of spinal cord lesions.

(18) The scrotum and testes: Anomalies, inflammation, hydrocele, spermatocele, henatocele, tumors; vas and cord; vesicles.

(19) Penis: Malformations, tumors, phimosis, paraphimosis.

(20) Pain in genitourinary tract: Varieties and significance.

(21) Hematuria and pyuria.

(22) Major operations (4 hours).

II. Clinics (46 hours): (1) Out-patients' department; clinics (32 hours).

(2) Operative clinics (12 hours).

(3) Diagnosis and treatment—ward visit (2 hours).

III. Laboratory exercises (12 hours): (1) Test for urea in the blood; the phenolsulphonephthalein test (2 hours).

(2) Demonstration: The tubercle bacillus (2 hours).

(3) Methods of pyelography—X-ray department (2 hours).

(4) Bacteriology of the gonococcus (2 hours).

(5) Demonstration of gross and microscopic anatomy of the genitourinary system (4 hours).

IV. Class exercises (10 hours): (1) Weekly class meeting: Review of the work of the week, submission of notes and case reports, general colloquium, quiz (10 hours).

Throughout the course it was intended that the student should examine and treat the patients, under the supervision of the instructor; that he should assist at major operations, when possible; that he should become familiar with the use of the cystoscope, with the methods of diagnosis preceding operation, and with the laboratory diagnosis of venereal disease.

The lectures were fully illustrated by lantern slides and by pathological specimens from the laboratory of the hospital and from the Warren Museum of the Harvard Medical School.

SCHOOLS OF NEUROPSYCHIATRY

The opening of the large number of camps almost simultaneously, in the summer of 1917, created such a great demand for neuropsychiatrists that it was hardly possible to send them to military officers' training camps for preliminary military training. A few were ordered to these camps and in addition a few officers who were taking the regular course of training at the camp were accepted for neuropsychiatric service; and some neuropsychiatrists acquired their military knowledge by the actual performance of duty. These methods of training were obviously inadequate, and it was found desirable to provide additional professional instruction. This instruction was generally furnished by the directors of special medical institutions at the following institutions: Michigan Psychopathic Hospital, Ann Arbor, Mich.; Boston State Hospital; Neurological Institute, New York City; Philadelphia General Hospital; Phipps Psychiatric Clinic, Baltimore, Md.; Government Hospital for the Insane, Washington, D. C.; Manhattan State Hospital, New York City.⁶⁷ The directors in question, who were given the title of military director, were generally the superintendents of the institutions who had been commissioned in the Army, or who were serving under contract. The military directors secured the collaboration of many other professionally prominent and representative teachers, each within his respective vicinity.⁶⁷

The student officers ordered to these schools were on duty status and between two and three hundred were given this instruction.⁶⁷ Reports were made to the Surgeon General by the directors, on the progress of the work, qualifications, etc., of the students, and from these reports it appeared that about 20 per cent of the student officers could be considered as qualified in this specialty at the close of the courses. The most promising students proved to be those

who had been in active work for about 10 years rather than the recent graduates, or older men.

The courses were outlined and scheduled for six weeks in duration, although in some cases it was necessary to interrupt the instruction where the services of the student officers were urgently needed for actual military duty, while in some instances students were kept at the schools for longer periods.⁶⁷ Even when courses were not actually in progress, there were usually some students left on special detail to profit by the usual clinical routine of the institutions concerned. In this manner the officers had exceptional opportunities to perfect themselves in their specialties, and the Surgeon General had the advantage of obtaining information as to an individual officer's professional and personal qualifications before he was assigned to military duties. The course of study included lectures, clinics, demonstrations, and laboratory work. The fields covered were psychiatry, psychology, personality problems, serology, neurology, neuropathology, with collateral instruction in otology and ophthalmology.

COURSE IN NEUROLOGY AND PSYCHIATRY, POST-GRADUATE SCHOOL OF
NEUROLOGY, PHILADELPHIA, PA.

In planning the courses in neurology and psychiatry the Philadelphia School considered the amount of time which the exigencies of the service would allow to be devoted to the subject, and the rosters and schedules were prepared accordingly.⁶⁸ While it was realized that the instruction given in neurology should be, and was, largely clinical, it was deemed essential to give some didactic and semididactic instruction in neuroanatomy, neurophysiology, and neurological medicine. The outlines were planned, therefore, to include a limited amount of this work. Physiology of the nervous system, especially as concerns cerebral, spinal, and peripheral localization, received particular attention, and an effort was made to follow closely the anatomico-physiological teaching by the presentation of clinical cases illustrating the subjects taught. Organic neurology was taught by systematic demonstration of organic symptomatology, illustrated by cases which were made to cover a wide range. The Philadelphia General Hospital provided many cases of tabes and other forms of sclerosis, syringomyelia, organic hemiplegia and other organic nervous diseases, which were demonstrated. The differentiation of such conditions as hemorrhage, thrombosis, and embolism and their separation from focal lesions like tumors and abscesses were amply illustrated. Moving-picture demonstrations were sometimes used. Instruction in syphilis of the nervous system and epilepsy were emphasized. The morphological recognition of disordered glandular functions were taught through a study of both neighborhood and glandular symptomatology. Pathology of the cerebrospinal fluid and neurohistology were thoroughly gone into. Electrodiagnosis and electrotherapeutics were covered, including a description of the various forms of electrical apparatus. Reactions of degeneration were elucidated and illustrated, and the diagnostic differences shown by cerebral, spinal and peripheral lesions were exhibited by a study of cases of hemiplegia, monoplegia, meningomyelitis, poliomyelitis, and nerve injury. Close attention was given to those phases of ophthalmology which are associated with neurological work. Instruction in neurootology included, among other phases, detailed instruction in the Bárány tests.

The plan for the course of instruction in psychiatry was based on suggestions contained in Medical Department Circular No. 22, Office of the Surgeon General, Washington, D. C., dated August 1, 1917.^h However, the instruction given was not confined to those suggestions, and full advantage was taken of the very large and varied amount of clinical material available.

COURSES IN NEUROPSYCHIATRY, STATE PSYCHOPATHIC HOSPITAL, ANN ARBOR, MICH.

The course of instruction in neuropsychiatry at the State psychopathic hospital of the University of Michigan was attended by 77 officers of the Medical Corps.⁶⁹ The first officer reported on July 23, 1917. The course was in charge of the director of the State psychopathic hospital, who was employed as a contract surgeon in the Army. The instruction was organized so as to give the officers as practical an experience as possible and stress was laid upon the relation of the various subjects to problems of military medicine. It included instruction in: Psychiatry; neuropathology; neurology; ophthalmology; otology.

The following abstract of the courses given at the State psychopathic hospital, Ann Arbor, Mich., gives an idea of the scope of the work covered in these schools.⁶⁹

PSYCHIATRY

Psychiatric instruction was given at the Psychopathic Hospital and the following subjects were covered:⁶⁹

1. General survey of the problems of mental disorders in their military relations (2 hours).
2. Discussion of the organization for neuropsychiatric work; of the schemes and methods for diagnosis and recording of data (2 hours).
3. General psychopathology; didactic lectures, with clinical demonstration (10 hours).
4. The functional mental disorders of the present war; survey of the experiences published in the German, French, and British literature (4 hours).
5. Shell shock and the psychoneuroses (2 hours).
6. Psychoneuroses; neurasthenia; anxiety neuroses; hysteria; compulsion neuroses; didactic lecture and clinical demonstrations (4 hours).
7. Manic-depressive insanity; didactic lecture and clinical demonstrations (2 hours).
8. Dementia præcox; didactic lecture and clinical demonstrations (4 hours).
9. Syphilitic mental disorders; didactic lecture, clinical and anatomical demonstrations (4 hours).
10. Epileptic mental disorders; didactic lecture and clinical demonstrations (2 hours).
11. Psychopathic personalities; didactic lecture and clinical demonstrations (4 hours).
12. States of mental defectiveness (2 hours).
13. Feeble-mindedness and mental subnormalities; didactic lecture and clinical and anatomical demonstrations (2 hours).
14. Psychometric tests; didactic lecture and practical work in making examinations of defectives and delinquents (6 hours).
15. Mental disorders of organic brain diseases; arteriosclerotic mental disorders; mental disorders with tumors of the brain and brain injury; didactic lecture and clinical demonstrations (2 hours).
16. Serological diagnostic demonstrations; technique and interpretation (2 hours).
17. Attendance at the psychiatric clinic in the medical school at the university (1½ hours each week).
18. Practical work in study of cases and preparation of histories on the wards of the hospital.

^h See Vol. I, p. 940.

NEUROPATHOLOGY

A systematic course in the pathological anatomy of mental and nervous disorders was given. This course covered 14 periods of two hours each. The subjects covered in this course were as follows:⁶⁹

1. Embryological development of the central nervous system. Surface topography of the brain.
2. Study of gross fiber arrangements and ganglia of the brain.
3. Histology of the nerve cell; nerve fiber; neuroglia and cortical architecture.
4. Histology of the spinal cord.
5. Neuronic arrangements of the nervous system. Fiber paths.
6. Localization of nervous function; correlation of structure and function; diaschisis; theoretical consideration of aphasia and apraxia.
7. General pathology of the nervous system; malformations; diseases of the membranes of the nervous system; pathological changes in nerve cells; pathological changes in nerve fibers; secondary degeneration.
8. Inflammation, repair, and reactive processes in the nervous system.
9. Syphilis of the nervous system; gummatous formations; meningitis; vascular lesions; histological process of general paralysis.
10. Circulatory disorders of the nervous system; arteriosclerosis; hemorrhage; softening.
11. Tumors of the nervous system.
12. Pathology of the spinal cord; myelitis; poliomyelitis; progressive muscular atrophy; amyotrophic lateral sclerosis.
13. Tabes; Friedreich's ataxia.
14. Pernicious anemia; multiple sclerosis; syringomyelia; hydromyelia; peripheral neuritis.

Exercises 1, 2, 5, and 6 were carried on with brain dissections and demonstrations.⁶⁹ Exercises 3, 4, 6 to 14 were carried on with studies of microscopic preparations.

NEUROLOGY

The instruction in neurology was given in the neurologic wards of the hospital of the University of Michigan. The course was divided into three parts:

- a. A lecture course designed to cover the course systematically.
- b. Clinical demonstrations in which the officer was assigned to a case and allowed one hour to examine, his examination and conclusion being criticized by the instructor before the whole section, and free discussion was encouraged.
- c. A series of formal clinics in neurology, the same as given to the senior medical students in the University of Michigan, with special emphasis on the military aspects of the cases under discussion.

OUTLINE OF LECTURE COURSE

Methods of history taking and filling out of forms used in the neuropsychiatric service of the United States Army.

Technique of neurologic examination; demonstration; routine methods for rapid examinations of men for neurologic conditions (as abstracted from memorandum of instruction issued to examiners in neurology and psychiatry relative to preparation of statistical data, dated September 13, 1917).

Aphasia; hemiplegia; bulbar syndrome; Jackson's syndrome; epilepsy—idiopathic and Jacksonian; optic atrophy; Paraplegia.

Brain injuries—localization; brain abscess; brain tumor; hydrocephalus.

Cerebral arteriosclerosis; cerebral embolism, thrombosis, and hemorrhage; bulbar palsy; syphilis of the nervous system.

Spinal cord injuries—localization; myelitis—transverse and traumatic; poliomyelitis; spinal cord abscess; spinal cord tumor; syringomyelia; lateral and combined sclerosis; tabes dorsalis; pachymeningitis; herpes zoster.

Neuralgia; neuritis—diphtheritic, alcoholic, and nonalcoholic; injuries to nerves; facial palsy.

Meningitis—cerebrospinal, tuberculous, and other forms.

Endocrinopathies—adrenal, thyroid, pituitary, and ductless glands; Basedow's disease; vagotonia; myasthenia gravis; paralysis agitans.

Lumbago; sciatica; pes planus; migraine; chorea, ties; chronic progressive tremor; eye disease; ear disease; Menière's disease.

Progressive muscular atrophy (other hereditary diseases of the nervous system, unlisted).

Psychoneuroses—neurasthenia, hysteria, psychasthenia, and other forms.

Traumatic neurosis—effects on the nervous system of traumatism that does not produce demonstrable organic change.

General treatment principles—psychotherapy, rest, massage, intraspinal therapy, etc.

* * * * *

There were approximately 640 cases in the Neurological Clinic during the period of the course, all of which were available for study by the medical officers taking the instruction.⁶⁹

OPHTHALMOLOGY

The following subjects covered, with the aid of drawings, specimens, and anatomical models:⁶⁹

A

1. A review of the anatomy of the eye as an optical instrument.
2. Physiology of the accommodation and physiologic optics.
3. Anatomy and nerve supply and physiology of the eye muscles, with binocular vision and fusion and including the deep origin, relation and course of the third, fourth, and sixth nerves.
4. Muscular anomalies such as manifest and latent spastic strabismus, including heterophoria.
5. Diplopia and extraocular paralysis and nystagmus.
6. Nerve supply and physiology of the pupillary reflexes, including miosis, mydriasis, hippus and Argle-Robertson pupil.
7. Anatomy and physiology of the retina, optic nerve, chiasm, primary visual ganglia, optic tracts, and cortical visual centers.
8. Mechanism of production of choked disk and significance.

B

1. Diagnosis of optic neurosis and malingering.
2. The eye manifestations of wounds of the motor and sensory nerve of the eye and of the optic nerve, tracts, radiations, and centers.
3. Visual fields and hemiopia.
4. Eye symptoms produced by intracranial lesions, with particular reference to trauma.
5. Eye symptoms of brain tumor, meningitis, multiple sclerosis, myelitis, locomotor ataxia, superior poliomyelitis, general paralysis, exophthalmic goiter including the various signs associated with exophthalmic goiter, chorea, migraine, and herpes zoster of the eye.

OPHTHALMOSCOPY

1. Direct and indirect methods, including examination of the ocular media with the ophthalmoscope.
2. Ophthalmoscopic appearance of the fundus and the diagnosis of syphilitic, albuminuric, diabetic, leukemic lesions of the fundus and other lesions of the fundus dependent upon general diseases.

3. Differential diagnosis of ocular lesions of the choroid, retina, and the optic nerve, with especial reference to their differentiation from those lesions associated with general diseases.
4. Ophthalmoscopic appearance and diagnosis of glaucoma.

Throughout the whole course from one-third to one-half of the time was devoted to the study of cases with the ophthalmoscope, with demonstration of the ophthalmic changes peculiar to ocular and general diseases with especial reference to their practical differentiation.⁶⁹

OTOLOGY

A course of lectures and demonstrations of disorders of the ear in their neurological relations was given, the following subjects being covered:⁶⁹

1. Functional examination of the internal ear; disorders of the cochlear portion of the eighth nerve; vestibular nystagmus.
2. Tests for detecting simulation of deafness.
3. Diseases of the internal ear; Menière's disease; arteriosclerosis of the internal ear; injuries to the internal ear; syphilis of the internal ear; hysterical deafness; occupational deafness.

In general it may be stated that the plan as followed worked out quite satisfactorily. The chief difficulty was the marked difference in preparation and experiences of the men for taking such a course as given. Some had had no neurological or psychiatric experience and had little interest in the field. Others had had a limited experience as physicians in hospitals for the insane. In many instances this occurred in their early medical work, and since then their chief interests had been the general practice of medicine. A relatively small number had had a somewhat better than average experience in neurology or psychiatry.

As the time during the day that might have been utilized in work was fully occupied by the various courses of instruction, the matter of military training while attending the course was left largely to the interest and wishes of the majority in a group.⁶⁹ Some groups showed a certain amount of interest in this matter, and systematic courses of drill were carried on under supervision of officers attached to the Reserve Officers' Training Corps of the university. The problem of maintaining a military attitude on the part of the men was difficult. There was a marked difference on this among different groups. When there were several in the group who had been previously in training camps there was some effort on the part of the group to carry out a military behavior. In general it must be said that there was little effort at this institution toward maintaining more than the usual relations between teacher and pupil.

The enlisted personnel for nervous and mental cases was made up, as far as it was possible to obtain them, from attendants who had previous experience in State hospitals. They were assigned to neurology and psychiatry duty direct, in some cases by orders, when already enlisted, and in others they were inducted into the service and were sent first, as far as possible, to a training camp where they were given military training and later assigned to permanent psychiatric duty. This special class of experienced men was by no means sufficiently numerous to meet the demand, and was supplemented by men from the Medical Department at large. As few of these had previous special training, they were sent, when possible, for instruction to St. Elizabeths Hospital, Washington, D. C.

The nurses were also obtained in large part from the training schools of State hospitals, and these women nurses became members of the Army Nurse Corps. Special women assistants, termed psychiatric aides, were taken into the Army after a course of training at Smith and other colleges.

CHAPTER VIII

MISCELLANEOUS SCHOOLS

SCHOOLS OF INSTRUCTION IN GAS DEFENSE

In May, 1917, the responsibility for the development and production of gas defensive appliances and material and the giving of instruction in their use and repair was definitely placed upon the Medical Department.¹ In order to train personnel for the technical and administrative phases of the work in gas-defense methods a central gas-defense school was established on August 20, 1918, in connection with the Infantry School of Musketry at Fort Sill, Okla.² The Adjutant General having selected and ordered to the school as instructors in gas defense three medical officers² whose names were among those of nine submitted by the Surgeon General.³ Other officers were subsequently ordered to the school for duty. In addition to officers and enlisted men from other branches of the service, detachments of medical officers, principally from the medical officers' training camps, were ordered there for courses of instruction, upon the completion of which they were ordered to the various divisional camps to be assigned as instructors in the camps and to divisions as division gas officers.⁴

This was the beginning, as far as the Medical Department was concerned, of training in gas defense. It led to the incorporation, by the Surgeon General, of the training section in the plans for the Gas Defense Service in his office, the duties of which were to provide instruction regarding the use of gas-defense appliances and the handling of gases used for training purposes, to train officers and men in the use of gas-sampling apparatus, gas detectors and other means of defense against gases, and to communicate the same to all concerned.⁵

By January, 1918, the divisional schools, having the advantage of complete equipment, and of advisers from the British Military Mission,⁶ were better prepared to carry on the instruction in gas defense than was the central school at Fort Sill; the school at Fort Sill, therefore, was discontinued as a central school on February 24, 1918.⁷

In addition to the gas-defense school at Fort Sill, a school was established at the American University, Washington, D. C., for the purpose of giving chemists of the field training section of the Gas Defense Service a course of instruction in gas-defense methods, these officers to be assigned to divisions as chemical advisers to the medical officers in charge of the gas schools.⁸ And on February 27, 1918, training in gas-defense methods was turned over to the Chief of Engineers.⁸

TRAINING SCHOOLS AT MEDICAL SUPPLY DEPOTS

The authorization of the Sanitary Corps in June, 1917,⁹ made it possible to obtain officers for duty as supply officers, purchasing agents, X-ray technicians, automobile and accountancy experts, etc., with the supply service, thereby providing the nucleus for the development of an adequate personnel.¹⁰

The camp medical supply depots developed at the several cantonments during 1917 proved most valuable assets, not only in the prompt and efficient furnishing of medical supplies to medical units at the camp, but, through training schools established in them, in the local training of enlisted and commissioned personnel in the nomenclature and the handling of medical supplies. The need for competent medical supply officers continued to increase and plans for training personnel were further developed. The enlisted personnel at the various camp supply depots who showed aptitude were promoted to the grades of noncommissioned officers. The best of these were selected and sent to the various training schools for medical supply officers. The principal schools were established at Newport News, Camp Meade, and Camp Upton.¹¹

An outline of instruction was proposed and carried into effect in these schools, covering the period from reveille to retreat. The training was necessarily very practical. Upon reporting for duty and instruction, the men were assigned to the various departments of the depot, that is, the receiving, issuing, and accounting departments, etc., and were carefully instructed in the details of the work pertaining to the department. They were changed from one department to another as experience and efficiency was gained. Lectures were outlined and given covering detachment work, accomplishment of forms, military correspondence, school of the soldier, courtesies of the service, etc.

The following is an example of the syllabus of instruction used in the camp medical supply depots:¹²

SYLLABUS OF LECTURES TO BE GIVEN BY CAMP MEDICAL SUPPLY OFFICERS

1. The supply tables:
 - (a) Classification of supplies.
 - (b) Nomenclature of supplies.
 - (c) Normal allowance of various Medical Department units (pars. 474-476 and 842-959, Manual for the Medical Department, 1916).
2. Requisitions (pars. 474-495).*
3. Transfer of medical supplies (pars. 496-500).*
4. Accountability (pars. 501-503).*
5. Distribution of field supplies in time of peace (pars. 504-506).*
6. Distribution in zone of advance (see Field Service Regulations).
7. Replenishment in combat (pars. 551-554 and par. 858).*
8. Returns of medical property (pars. 507-508).
9. Sales of medical property (pars. 509-510).
10. Distribution of medical property on abandonment of post (par. 511).*
11. Use and care of medical property (pars. 512-526).
12. Base medical supply depots (pars. 782-786).
13. The advance medical supply depot (pars. 787-792).

SCHOOLS FOR TRAINING IN MOTOR MAINTENANCE AND OPERATION

On December 8, 1917, the Surgeon General accepted the offer of the Carnegie Institute of Technology, Pittsburgh, Pa., to use the instruction facilities of the department of automobile mechanics in that institution in the training of medical officers and enlisted men of the Medical Department in maintenance and operation of motor vehicles.¹³ It was proposed to detail

* Figures refer to paragraphs in the Manual for the Medical Department, 1916.

approximately 4 classes, each consisting of 2 officers and 25 enlisted men selected from among those at training camps who had basic knowledge of gas-engine mechanics, in order that they might be given further intensive special instruction in maintenance and operation. The course was for one month. The policy adopted provided that officers and enlisted men who qualified as gas-engine experts would be assigned to motorized units of the sanitary trains serving with mobilized divisions. Instruction was largely practical, and comprised automobile mechanism, automobile repairing, ignition systems and practice in drawing and reading blue prints, "trouble shooting," finding defects for repair, and work in ignition laboratory. Students were observed during and examined upon completion of the course and graded in technical knowledge, originality and aptitude.¹⁴

Four sessions each for different classes were planned and conducted between January and June 27, 1918.¹⁵ Later arrangements were made for the training of several additional classes.¹⁵ Upon completion of their courses of instruction officers and enlisted men were assigned to motorized units of the Medical Department where, as instructors and consultants, they developed into valuable adjuncts in the training of personnel engaged in the operation and maintenance of motor vehicles.

The following is an example of a course of instruction given to a detachment of the Medical Corps in automobile maintenance and operation, at this institution, with subjects of instruction and hours allotted to each.¹⁶

	Hours
Automobile repair and machine-shop practice.....	39
Fundamental principles of electricity; lecture.....	12
Practical ignition work.....	27
Practical motor work and trouble shooting.....	40
Motor cycle and automobile driving.....	12
Acetylene welding; simple.....	16
Principles of mechanical drawing.....	12
Motor and chassis lecture.....	8
Examination, beginning.....	8
Examination, leaving.....	8
Total.....	186

Equipment used in motor laboratory.—One Packard truck motor, 1 standardized Army truck motor, 3-ton; 1 Dodge motor; 1 Ford motor; 1 Pierce-Arrow truck motor; 1 General Motors Co. truck; 1 large Continental motor; 1 Wisconsin motor as used on Garford 2-ton truck. All these motors were equipped with complete ignition and carburetor systems and with water and exhaust systems for running.

For ignition and carburetor work.—Bosche, Dixie, Eisman high-tension magnetos. Delco, Remy, and Standardized Army truck battery ignition systems. All representative types of carburetors used at the present time in the Army service, including the plain tube Stromberg, Marvel, Stewart, Rayfield, Schebler, etc.

Three tables were made for the purpose of showing the various ignition systems, and to allow the student to trace out and build up circuits, from the simplest to the most complicated.

For driving practice and chassis repair work.—One General Motors Co. $\frac{3}{4}$ -ton truck; 1 Ford truck; 1 White truck chassis; 1 Maxwell chassis; 1 Peerless chassis, and the use of 1 Dodge car for instruction 2 afternoons per week. For motor-cycle work 2 Indian motor-cycles with side car were available.

For general repair and machine-shop practice.—There were available work benches and vises, and for a small amount of machine-shop practice there were available lathes, arbor presses, and various other machine tools.

Description of various parts of instruction; automobile repair.—It was the intention to show the best methods of repair on various parts of the motor and chassis, without the use of complete hand and machine tool equipment. At the same time a small amount of time was given to the operation and handling of tools that would be found in a completely equipped shop.

Electricity lectures.—These were intended to present the subject of principles of electricity and magnetism in a brief manner and with special application to ignition systems. They were presented in simple form and illustrated by demonstration and lantern slides.

Practical ignition work.—In this work magnetos were disassembled and the various parts and circuits explained. The student actually performed this work himself, and assembled this magneto, made all adjustments, and placed it on the motor in proper time. The same process was repeated with a battery system of ignition.

Practical motor work and trouble shooting.—This consisted of removing the vital parts of one or two motors, fitting up bearings, timing valves, and getting the motor in good operation again. Emphasis was placed on the proper method of overhauling a motor and replacing all parts in proper manner without injury. Finally the motor was operated with water-cooled jackets and final adjustments made.

Trouble shooting consisted of systematic trouble finding. The motors were purposely placed with some manner of trouble on them and the student required to find and correct it. This was repeated until a list of the most important troubles with carburetor and ignition systems were shown and explained. Most experienced automobile men can locate trouble if given time, but few have adopted a system of elimination whereby trouble can be located quickly.

Motor cycle and auto truck driving.—This took only a small part of the time of the course and was intended to give those who were not familiar with driving of either motor cycle or truck a fair amount of practice in both. Practically all men of this detachment were good truck drivers, but some were not so good with the motor cycle. It was the intention to pick these out and make them more efficient in this part of the work.

Simple acetylene welding.—Twelve hours were given to the use of the acetylene flame and making simple welds of iron and other metals.

Drawing.—This was intended as a practical course to give the man a clearer idea regarding the conventions used in making a drawing so that he might be better able to read a blue print of an automobile chassis or motor, and be able to pick out the construction from such print.

Text book used to supplement lectures was Hobbs and Elliott's "Gasoline Automobile."

SCHOOLS FOR LABORATORY TECHNICIANS

The occurrence, in the fall of 1917, of large numbers of measles cases, with the resultant pneumonias and the occurrence of a considerable number of cases of meningitis, called for an increased number of trained personnel in the Army laboratories, and it became evident that the measures already taken for the training of laboratory personnel were not sufficient to meet this increased demand. Therefore with the assistance of the medical division of the National Research Council, schools were established and courses of instruction standardized for training women who were not experienced in medical work as laboratory technicians. The following is a list of the most important schools established for this instruction:¹⁷ Rockefeller Institute, New York, N. Y.; New York City Board of Health; New York State Laboratory, Albany, N. Y.; New York Post-Graduate Medical School and Hospital, New York City; Hunter College, New York City; Massachusetts Institute of Technology, Boston, Mass.; The Philadelphia Polyclinic and College, Philadelphia, Pa.;

The Woman's Medical College of Pennsylvania, Philadelphia, Pa.; Philadelphia Bureau of Health, Philadelphia, Pa.; University of Chicago, Chicago, Ill.; Illinois College, Jacksonville, Ill.; Ohio State University, Columbus, Ohio; Medical School, University of California, Berkeley, Calif., in cooperation with the George William Hooper Foundation for Medical Research.

The courses given in most of these schools were outlined by the Surgeon General, and were designed to train women in this country as laboratory technicians for duty in the base hospitals and other laboratories. Some of the schools included men as well as women. It was desirable that four types of technicians be available for work in the base hospitals; the first three to be women, the fourth to be men of the Sanitary Corps, whose training had otherwise been arranged for. The instruction was based on eight hours' work per day. The following is the outline of instruction sent to these schools, upon which the courses were bases:¹⁸

Class I. Clinical urinalysis, hematology, gastric analysis, feces. High-school girls of special ability or college graduates.....	1 month.
II. Preparation of sections and of media. High-school girls.....	1 month.
III. Bacteriology and Wassermann technique. College graduates who had had bacteriology.....	10 weeks.
IV. Quantitative analyses of urine and blood—metabolic work. Chemists who have had special courses.....	2 weeks.

At the completion of each course a list of the students was forwarded to the Surgeon General with an estimate of the type of work which each had performed. The method of grading was as follows: A = excellent; B = very good; C = probably not available for appointment without further training. Applicants from among those qualified were accepted in the laboratory division as civilian employees and sent to the various laboratories throughout the Army as needed.

On November 30, 1918, 398 female technicians were on duty in the United States Army Laboratory Service, practically all of whom had been trained in these schools.¹⁹

SECTION II
IN THE AMERICAN EXPEDITIONARY FORCES
CHAPTER IX
TRAINING PROJECT

Medical Department training, as well as the training of all other branches of the American Expeditionary Forces, was under the supervision and control of the training section of the general staff, general headquarters, A. E. F.¹ Therefore the scheme for training Medical Department troops conformed, at least at first, to the general program, which was based upon the organization of the American Expeditionary Forces. In this organization, a six-division corps was adopted.² Each corps was to have four combat divisions and two replacement divisions. One of these replacement divisions was to be established in some convenient training area behind the general position of the combat divisions.³ Its function was to hold and train replacements in officers and men of all grades for the first-line divisions. The sixth division, forming the second of the two replacement divisions, was to be called the depot division and to be stationed near the ports. This depot division was to receive drafts from the United States and give them little more than individual training. It was then to send these partially trained men to the replacement division for the completion of their training.

It proved impossible to carry out this replacement scheme; however, upon it was necessarily and conveniently hung the entire school system of the American Expeditionary Forces.³

The program referred to above was outlined by the chief of the training section, general staff, A. E. F., in the following memorandum:

HEADQUARTERS AMERICAN EXPEDITIONARY FORCES,
OFFICE OF THE CHIEF OF STAFF, TRAINING SECTION,
Paris, August 27, 1917.

Memorandum for the Chief of Staff.

Subject: School project for American Expeditionary Forces.

1. A study of the French and British systems of training of troops in France indicates that the following school project will best meet the needs of the American Army:

(a) In each division a system of troop training under the direct supervision of the division commander involving such incidental school instructions as may be desirable in the training of the division and for the purpose of producing instructors in corps schools.

(b) A center of instruction for each corps for the purpose of training the replacements of all grades and the commanders of all units. This naturally places the center of instruction at the location selected for the first replacement division of each corps and contemplates that each group of corps schools shall instruct commanders of proper grades for four combat divisions, assuming that the organization of corps recommended at these headquarters will be approved in full. Until the system is in complete operation it will also be necessary to train at corps schools a number of officers who will ultimately become instructors in Army schools.

(c) A center of instruction for the entire army in France, to be known as the army schools. This group should include a general staff college and such other schools as may be necessary to train instructors for all corps schools. The army schools should be under the direct control of these headquarters in order that the doctrine which should actuate the entire system of instruction and control our ideas of combat may be transmitted from the general staff through these schools to all units of the army.

As these schools will train a great number of men comparatively unfamiliar with actual operations, the group should be placed in contact with large bodies of troops. The necessity of economy of administration and uniformity of instruction require that the schools be grouped together so far as practicable. They should, however, be on or near the main lines of communication, close to the zone of the army, but far enough away from the front to be comparatively safe from hostile aircraft. They should be so located as to insure permanency, but not in such locality as to influence future action in regard to the front to be occupied. All of these conditions may be satisfied if the 2d Replacement Division of the First Corps, which would ordinarily be placed near one of the bases, on the west coast of France, were moved forward instead into a suitable division cantonnement, in the area bounded by Orleans—Montargis — Troyes — Chaumont — Langres — Gray — Dijon — Chalon — Nevers — Bourges—Issoudun—Blois. The various army schools should be so grouped with respect to the division as to permit the members of any or all of the schools to attend any or all of the demonstrations conducted by troops without in any way detaching troops for this purpose from divisions at the front, or in any way impairing the efficiency of troop training in the replacement division itself.

2. It will be impossible to put this system into complete operation until the entire First Corps has reached France. Under the present schedule of troops arrivals, this will occur about November 15 next. In the meantime it is necessary to meet the needs of army training as they arise and to utilize existing facilities to the best possible advantage. Thus the schools at Saumur and other points may be used for the training of the 2,200 reserve officers to reach France not later than September 15; Mailly may be used for our heavy artillery school; Arnouville-les-Gonesse may be used for the training of our antiaircraft guns, but these widely scattered schools should be regarded as expedients only and every effort should be made to bring all of our institutions for army training into close proximity, if possible, in the area above referred to, where the 2d Replacement Division of the First Corps should be located as already outlined.

It may be necessary to depart from this plan in some cases, but departure from the plan should be accepted only if compelled to by circumstances beyond our control.

3. Should it be found impracticable to concentrate the army schools and the 2d Replacement Division in the area named, then it is thought that both the division and the schools should be placed near one of the bases on the west coast of France. Should this be found impracticable, which is highly improbable, then it will be found necessary to locate the schools at a number of widely separated points. In order that the best possible solution may be secured, it is thought necessary to designate at once the prospective commandants of these schools, acquaint them with the situation and direct them to make the necessary study of the corresponding British and French schools and submit recommendation in regard to the organization, equipment, personnel, and curriculum best suited to our needs. While this work is in progress, the operations and training sections, working in cooperation and with the French General Staff should locate the exact area best suited for this work and take the necessary steps to place the schools and the division in the area selected.

(b) That the French Government be advised of the decision of these headquarters to place the 2d Replacement Division and the schools named in the area referred to and that the training section, in cooperation with the operations section, be authorized to take the necessary steps to accomplish the results desired.

(Signed) PAUL B. MALONE,
Lieutenant Colonel Infantry, D. O. L.,
Chief of Training Section.

SCHOOL PROJECT FOR AMERICAN EXPEDITIONARY FORCES

Per combat division: No schools—troop training.

Per army corps: Army corps center of instruction (located at 1st Replacement Division of each army corps and under supervision of division commander).

Object: (1) Training replacements; (2) training various commanders of all units, etc.

(A) TRAINING

1. Drafts of all arms received from base replacement division.
2. Training of men to be noncommissioned officers of all arms.

(B) ARMY CORPS SCHOOLS

1. The corps infantry school: Section A, platoon and section commanders; Section B, rifle company commanders; Section C, machine gun platoon and company commanders; Section D, trench mortar (3 inch Stokes and 37 mm.); Section E, lines of information.

2. The corps artillery school: Section A, Lieutenants and battery commanders (3 inch and 6 inch howitzers); Section B, instrument sergeants and range finders; Section C, lines of information (radio, telephone, and signal); Section D, artillery information, firing charts, sound ranging, flash ranging.

3. The corps engineer school: Section A, company and platoon commanders; Section B, sapper's school; Section C, pioneers' school (Engineers, Infantry, Cavalry, and Field Artillery).

4. The corps cavalry school: Section A, mounted service school. NOTE.—Captains and lieutenants attend Infantry and Engineer schools.

5. The corps gas school: For all arms of the service.

6. The corps signal school: Section A, company and platoon commanders; Section B, special noncommissioned officers.

7. The corps sanitary school: Ambulance and field hospital company officers.

8. The corps aeronautical school: Section A, combat aviation school; Section B, combat balloon school.

9. The corps field officers' school: All lieutenant colonels and majors (includes school course and visits to all schools).

ARMY SCHOOLS

Army schools (located at 2d Replacement Division of First Army Corps and under direct supervision of general headquarters).

Object: (1) Training instructors for corps schools; (2) Training special officers.

1. The general staff college, A. E. F.: Special officers selected for general staff work.

2. The army line schools, A. E. F.: Section A, Infantry lieutenants; Section B, Artillery lieutenants; Section C, Engineer lieutenants; Section D, Signal lieutenants (trained to include company and battery commanders duties). Section E, captains, majors, and lieutenant colonels of all arms; Section F, line of information (liaison of all arms); Section G, sanitary service.

3. The army candidates' school, A. E. F.: Training soldiers to be officers (if necessary to be divided into sections for each arm).

4. The army antiaircraft school, A. E. F.: Section A, Artillery; Section B, machine guns.

5. The army artillery school, A. E. F.: Section A, heavy artillery; Section B, trench artillery; Section C, railroad artillery.

6. The army signal school, A. E. F.: Section A, telegraph; Section B, telephone; Section C, radio; Section D, visual methods; Section E, system operations; Section F, carrier pigeons.

7. The army aeronautical schools, A. E. F.: Section A, aviation school; Section B, balloon school; Section C, Infantry and Artillery observers, organization and training.

8. The army sanitary school, A. E. F.: Complete outline to be announced later.

9. The army engineer school, A. E. F.: Section A, sapper's school; Section B, pioneer school for Engineers, Infantry, Cavalry, and Field Artillery; Section C, bridging; Section D, mining; Section E, searchlights; Section F, ranging; Section G, topography; Section H, camouflage.

10. The army Infantry specialists' center, A. E. F.: Section A, automatic weapon; Section B, musketry, bayonet, and sniping; Section C, grenade, trench mortar, 3-inch Stokes, and 37 mm.

11. The army center of information, A. E. F.: Conferences and demonstrations for all generals and colonels of all arms.

12. The army tank school, A. E. F.

13. The army gas school, A. E. F.

BASE TRAINING CENTERS

Army corps base training center (located at 2d Replacement Division of each army corps and under supervision of division commander).

Objects: (1) Training new drafts; (2) special classes of soldiers.

(a) Training: Training new drafts individually of all arms and services.

(b) Base training schools: Section A, cooks and bakers; Section B, clerks; Section C, mechanics; Section D, saddlers, horseshoers, and stable sergeants; Section E, drivers and packers; Section F, chauffeurs; Section G, telephone operators; Section H, telegraph and radio operators.

Thus training in its broader sense was to include the field training of troops, and schools to train officers as instructors, for command, and for special service.

FIELD TRAINING

Training in the American Expeditionary Forces was intended to complete the preliminary training given in the United States, and was planned to be given as follows:³ (1) One month's training in technique of the special service as required for the American Expeditionary Forces, conditions including terrain exercises and maneuvers in the open and trench operations in the training area for division, corps, and army troops; (2) one month's training in actual occupation of a quiet sector to inure troops to field and fire conditions and to test organizations and teamwork under stress; (3) one month's training in maneuvers and terrain exercises of open operations in training areas. In passing, it might be said that because of the pressing demand for troops for combat early in 1918, few divisions received the full period of three months' training in France.³

To economize in time of training after arrival in France, War Department was requested, in the fall of 1917, to send ahead of each division a staff officer familiar with training in the United States to report with previous schedules to G-5 headquarters, A. E. F. The training program for the first phase in France was to supplement and complete what had been done in the United States.³

Arrangements were also made with War Department by which each division should cause approximately one-third of its officers and noncommissioned officers to precede it to France long enough to go through one of the corps schools before the arrival of the division.³ These officers then were able to meet their divisions and give them the last thing in the development of methods and practice in France.

The following outline shows the amount of training it was contemplated that sanitary troops would receive during the three months' period referred to above:⁴

SCHEME OF TRAINING FOR SANITARY TROOPS

FIRST MONTH

First week:

For all sanitary troops of the division—	Hours
School of the soldier and squad-----	5
Personal hygiene; footgear, their fitting; trench feet-----	5
Duties of the soldier; Army and camp regulations-----	1
Military courtesy-----	1
Equipment of the soldier—responsibility and care-----	1
Organization of the Army-----	1
Materia medica and pharmacy-----	5
Anatomy and physiology-----	5
Organization and duties of the Medical Department-----	1
Care and use of animals and equipment; care of transportation; individuals or units assigned mechanical transport will be instructed in the care of animals, equipment, and transportation until motors are issued, when this time will be used for instruction in care, operation, and driving-----	5
Total-----	30
For medical and dental officers (in addition to the time allotted above)—	
Customs of the service-----	1
Official correspondence-----	1
Daily reports and returns-----	1
Total-----	3
For noncommissioned officers—	
Official correspondence-----	1
Daily reports and returns-----	2
Total-----	3

Second week:

For all sanitary troops—	
School of the squad and detachment or company-----	5
Diseases—classification and causes-----	1
Diseases acquired by contact—prevention—venereal prophylaxis-----	1
Food and fly-borne diseases—prevention-----	1
Mosquito-borne diseases—prevention-----	1
Louse-borne diseases—prevention—laundries—delousing-----	1
The Articles of War and courts-martial-----	2
Sanitary troops of the battalion, regiment, division, corps, army-----	1
Materia medica and pharmacy-----	5
Anatomy and physiology-----	5
The Medical Department equipment of the battalion and regiment; camp infirmary-----	2
Care and use of animals and equipment—care of transportation as in first week-----	5
Total-----	30
For medical and dental officers (in addition to the time allotted above)—	
Monthly reports and returns-----	2
Property accountability and responsibility-----	1
Total-----	3
For noncommissioned officers—	
Same as above-----	3

Third week:

	Hours
For all sanitary troops—	
School of the squad, detachment, or company; manual of the litter.....	5
Flea, bug, and tick borne diseases—prevention.....	1
Diseases due to exposure, trauma poisons—prevention.....	1
Excess and deficiency diseases.....	1
Sanitary service of the camp and billet.....	2
Materia medica and pharmacy.....	5
Anatomy and physiology.....	5
The ambulance company—equipment and functions.....	2
The field hospital company, the mobile surgical unit, the mobile hospital, the mobile laboratory, the medical supply unit—equipment—care of transportation as in first week.....	5
Total.....	30
For medical and dental officers (in addition to the time allotted above)—	
Bimonthly, quarterly, and annual reports and returns.....	3
For noncommissioned officers—	
Same as above for officers.....	3

Fourth week:

For all sanitary troops—	
School of the detachment and company; the loaded litter.....	5
Sanitary service of the march in campaign.....	2
Sanitary service in combat.....	2
Shelter and evacuation of casualties.....	1
Pitching shelter tents, hospital ward, and pyramidal tents.....	5
Materia medica and pharmacy.....	5
Anatomy and physiology.....	5
Care and use of animals and equipment; care of transportation (as in first week).....	5
Total.....	30
For medical and dental officers (in addition to the time allotted above)—	
Occasional reports and returns.....	3
For noncommissioned officers—	
Same as above for officers.....	3

SECOND MONTH

First week:

For all sanitary troops—	
School of the detachment and company; removing wounded without litters...	3
First aid.....	3
Gas defense.....	2
Effects of artillery and infantry fire.....	1
A march of $2\frac{1}{2}$ miles with halt and establishment of battalion and regimental aid station or dressing station under an assumed situation, individual cooking, and return to camp.....	6
Nursing.....	4
Riding, driving, or ambulance drill for ambulance companies.....	5
A march of $7\frac{1}{2}$ miles under an assumed situation appropriate for the sanitary unit or detachment.....	6
Total.....	30
For medical and dental officers (in addition to the time allotted above)—	
Occasional reports and returns.....	3

First week—Continued.

For noncommissioned officers—

Same as above for officers	Hours 3
----------------------------------	------------

Terrain exercises: Regimental and battalion surgeons will participate in all regimental and brigade terrain exercises. The division surgeons, commanding officer sanitary train, director ambulance section, and director field hospital section, will participate in all division terrain exercises.

Second week:

For all sanitary troops—

School of the detachment or company; the ambulance	3
First aid	3
Construction of fire shelter	1
Gas defense	2
A march of 3 miles as required in first week, second month	6
Nursing	4
Riding, driving; ambulance drill for ambulance companies	5
A march of 7½ miles under an assumed situation appropriate for the unit or detachment	6
Total	<u>30</u>

For medical officers only—

Terrain exercises (see note first week, second month).

Third and fourth weeks:

For all sanitary troops—

School of the detachment and company; the loaded litter; gas mask worn 15 minutes in each drill	3
Field training: The solution of problems of the sanitary service, either independently or in participation with organizations to which attached, under assumed situations appropriate to the unit. Solution to cover recommendations as to sanitary procedures, management of the sanitary service, selection of sites for unit stations, selection of routes of approach and sanitary evacuation and preparation of casualty lists, with patients represented by tagged individuals (problems for divisional units to be prepared by division surgeon—3 problems, 1 of which shall include a 10-mile march)	18
Nursing	5
Map reading and sketching; location by coordinates	4
Total	<u>30</u>

For officers only (in addition to time allotted for other instructions)—

Terrain exercises (see note first week, second month).

THIRD MONTH

First week:

For all sanitary troops—

School of the detachment or company; methods of removing patients without litter; masks worn 15 minutes at each drill	2
Field training (same as in program third and fourth weeks, second month)	18
Construction of splinter proofs and bombproofs	6
Application of the Thomas splint	4
Total	<u>30</u>

For medical officers only—

Terrain exercises (see note first week, second month).

Second and remaining weeks:

For all sanitary troops—

	Hours
School of the detachment or company	2
Field training (same as in program third and fourth weeks, second month; one march, halt over night, 12 hours; problem 6 hours)	18
Construction of splinter proofs and bombproofs	6
Application of the Thomas splint	4
Total	30

For officers only—

Terrain exercises (see note first week, second month).

FOURTH MONTH

First and second weeks:

For all sanitary troops—

School of the detachment or company	2
Field training (same as in program third and fourth weeks, second month)	24
Application of the Thomas splint	2
Demonstration of sanitary devices for use in the European theater of war	2
Total	30

For medical and dental officers only (in addition to time allotted above)—

Terrain exercises (see note first week, second month).

Instruction in reports, returns, and records and regulations of the American Expeditionary Forces	3
---	---

For noncommissioned officers only—

Instruction in reports, returns, records, and regulations of the American Expeditionary Forces	3
--	---

Third and fourth weeks:

For all sanitary troops—

School of the detachment and company	2
Field training (same as in program third and fourth weeks, second month)	24
Application of the Thomas splint	2
First aid treatment of gassed cases	2
Total	30

For medical officers only (in addition to time allotted for other instruction)—

Military medicine (psychology, psychiatry, malingering, special diseases, including gas poisoning and treatment)	3
--	---

Military surgery (sepsis and treatment; infections by anaerobes—treatment; shock; special methods of treatment, including prophylaxis, and treatment of trench foot	3
---	---

For noncommissioned officers only—

Same as preceding two weeks	3
-----------------------------------	---

Special training: In addition to the combat and technical training or organizations given in this program additional training will be given as follows—

For all troops (daily except Sunday), physical training (minimum), 20 minutes.

For all buglers, manual of the bugle, 30 minutes.

For mess sergeants and cooks (including one alternate mess sergeant and two alternate cooks), course to be given at a convenient time during the earlier weeks of the training period by a visiting field party of the Medical Department food and nutrition section which will carry with it a rolling kitchen and equipment for establishing a center of instruction within the divisional training area. Subjects of course: Food principles and values; selecting and balancing the diet; storage and preservation of foods; arrangement of the kitchen; care and cleaning of kitchen and equipment; cooking and service; use of the rolling kitchen and equipment; improvisation of cooking devices; food conservation and salvage of kitchen wastes; kitchen sanitation.

Instruction for drivers of motor transportation (center of instruction to be established within the division area by the commander of trains). Subjects of instruction: Cleaning and oiling; starting and stopping; shifting gears; making road repairs; driving; moving in train; parking; traffic regulations; towing; troubles.

The application of the scheme given above to the training of the Medical Department with divisions can be shown by the following extract from program of training for 86th Division:

SANITARY TROOPS

First week:

	Hours
Close order drill; the loaded litter and first aid.....	3
Defense against gas.....	2
Personal hygiene; venereal prophylaxis, care of feet, shoes, trench feet.....	1
General hygiene; march, camp, trench, combat, disposal of the dead.....	3
Water and food; supply examination, treatment, preservation, in trench and field.....	1
Clothing; laundries, bathing, supplies, methods of cleaning, devices, delousing, insecticides.....	2
Disposal of wastes and demonstration of sanitary devices—human, animal, kitchen and camp garbage, in field and trench warfare.....	2
Organization of the American Expeditionary Force.....	1
Disposition of combatant and auxiliary troops; march, attack, defense, retirement, trench warfare.....	3
Artillery and infantry weapon; effects.....	1
Intrenching (instructions for the defensive combat of small units).....	5
Attached sanitary troops—construction of shelter for battalion and regimental aid stations in connection with work of rifle companies and battalions, construction of shelter for advanced groups of litter bearers, dressing stations, etc. March (a day's march of not less than 10 miles); attached sanitary troops will march and function as sanitary troops under the assumed situations of the organization to which attached (see general program).....	6
Total.....	30

Second week:

Close order drill; handling patients without litters.....	3
First aid and Thomas splint.....	3
Defense against gas.....	2
Shelter—selection, improvization, construction of huts—barracks, billets, and their sanitary inspection.....	2
Field orders.....	1
Field sketching and map reading.....	6
Intrenching.....	4
Organization of the sanitary service—battalion and regimental detachments, camp infirmaries, camp hospitals, the sanitary train, the sanitary column, and other establishments and their units of the line communications; their personnel, functions, and equipment for open and trench warfare.....	3
March (a practice march as required in program for first week).....	6
Total.....	30

Division terrain exercises.—The division surgeon, commanding officer, sanitary train, and directors of ambulance companies and field hospital sections will participate in all division terrain exercises.

Third week:

Close order drill and the ambulance.....	3
First aid and use and application of the Thomas splint.....	8
Defenses against gas.....	2
Casualties; classification and disposal.....	1

Third week—Continued.

Field training—

For battalion and regimental detachments—

- (a) Practice and training in methods and duties pertaining to the sanitary service of units to which attached..... 10
- (b) Open warfare: Sanitary service of the march, camp, attack, defense, retirement, advance, and rear guard. Solution and execution of problems independently, and combined with the organizations to which attached. Solutions to cover recommendations as to sanitary procedures and sanitary orders; selection of sites for unit stations; selection of routes of approach and sanitary evacuation; actual establishment of casualty lists, with patients represented by tagged individuals.
- (c) Trench warfare: Solution of problems given above under open warfare together with actual construction of shelter and adaptation of equipment and procedures to changed conditions due to types of action.

For divisional units—Field training as given in (b) and (c) under conditions assumed, appropriate for the unit..... 10

A. B. C.: Battalion, regimental surgeons and all sanitary units will participate in terrain exercises with the units to which attached in connection with the general program.

March: A practice march as required in program for first week..... 6

Division terrain exercises: The division surgeon, commanding officer, sanitary train, and directors of ambulance companies and field hospital sections will participate in all division exercises.

Fourth week:

Close order drill, the loaded litter, the ambulance..... 6

Defense against gas..... 2

First aid and use and application of the Thomas splint..... 6

Field training—

For battalion and regimental detachments—

- (a) Practice and training in methods and duties pertaining to the sanitary service of the units to which attached as given for third week..... 10

For divisional units—

As given for third week..... 10

March (as required in program for first week)..... 6

NOTE.—The instruction will consist of conferences, practical exercises, demonstrations, and problems for the purpose of training the personnel of the sanitary service in its duties, both in open and trench warfare, and must be thorough and practical. Instruction in sanitation, medicine, and surgery will be limited to preparations for the mastery of the problems presented by the service conditions which may be encountered by the American Expeditionary Forces in open and trench warfare.

DURING THE TRAINING PERIOD

For medical officers only, in addition to time allotted for other instruction:

1. Military surgery—sepsis, antisepsis, infection by anaerobes, shock, special methods of treatment including prophylaxis and treatment of trench feet..... 10
2. Military medicine—psychology, psychiatry, malingering, special diseases, including gas poisoning and treatment..... 10

Division terrain exercises: The division surgeon, commanding officer, sanitary train, and directors of ambulance companies and field hospital sections will participate in all division terrain exercises.

MEDICAL DEPARTMENT SCHOOLS

Medical Department schools in the American Expeditionary Forces comprised the Army Sanitary School, Langres (Medical Corps School; Dental Corps School); corps schools; special schools (gas school, Gondrecourt; First Replacement Depot Sanitary School, St. Aignan-Noyers).⁴ The Army Sanitary School, Langres, is the subject of a separate chapter.

CORPS SCHOOLS

The first of the corps schools to be established was the First Corps school, which began operations at Gondrecourt, France, as the First Corps center of instruction, and was intended to cover the 1st, 2d, 26th, and 42d Divisions training in the vicinity. It contained a field service school for medical officers established under the name of First Corps Sanitary School, October 15, 1917.⁴ The course was planned to cover five weeks; however, owing to an epidemic of scarlet fever at Base Hospital No. 18, where the school was established, the course was abandoned after three weeks.⁴ The director was relieved from duty November 3, 1917, and ordered to the Army schools at Langres for duty as commandant of the Army Sanitary School to be opened thereat.⁴

After the abandonment of the first course, the First Corps Sanitary School began another course in January, 1918, with only a few medical officers in attendance. Because of the scarcity of shelter, material, and personnel in the American Expeditionary Forces, neither equipment nor special shelter could be secured, consequently the school was unsatisfactory as to results and no further courses were held.

In February, 1918, a sanitary school was established at the Second Corps school organized at Chatillon sur Seine, where better facilities for housing and instruction existed. However, because of the shortage of medical officers in the American Expeditionary Forces this sanitary school completed only one course of four weeks. As the shortage of medical officers was not remedied, it was found that the Army Sanitary School at Langres could accommodate all the medical officers coming with advance detachments and the few others that could be spared from combat divisions and the Services of Supply, and no other corps sanitary schools were established. This was the only Medical Department field service school operated after February, 1918.⁴

The following program was prepared for tentative use in connection with Medical Department training in corps sanitary schools:⁴

TENTATIVE PLAN FOR CORPS SANITARY SCHOOL

There will be five principal subjects treated in the corps school, which will be a five weeks' course. Two weeks of this should be devoted to war surgery and military medicine. The other three weeks should be spent at the school, where, in contact with divisional troops, attendants will be taught the other three subjects:

WAR SURGERY

1. General principles of surgery.
2. Emergency surgery at the front and general treatment of wounded
3. Special surgery:
 - (a) Wounds of face and neck.
 - (b) Wounds of chest and abdomen.
 - (c) Wounds of head, brain, and nervous system.
 - (d) Wounds of blood vessels.
 - (e) Fractures and joint injuries.
4. Roentgenology.
5. Venereal diseases and genitourinary surgery.

MILITARY MEDICINE

1. Influence of war in producing diseases not infectious.
2. The psychology and psychiatry of war, malingering.
3. The remedial agents supplied by the Medical Department.
4. The field laboratory.
5. Nursing.
6. Special pathology, symptoms and treatment of gassed cases.
7. The communicable diseases.
8. Preventive medicine and carriers of pathogenic organisms.
9. The importance of mild respiratory infections, their nature, probable etiology and means of prophylaxis; pneumonia.
10. Infections in general, and their treatment.
11. Transfusions.
12. Diseases of the skin.

MILITARY HYGIENE

1. Morbidity and mortality in the military service.
2. Insecticides.
3. Physical culture.
4. The march; the camp.
5. Personal hygiene.
6. Water.
7. Food, dietetics, and cooking.
8. Clothing and equipment.
9. Shelter and the construction of military hospitals.
10. Heating and lighting.
11. Disposal of wastes and latrines.
12. Disinfection, disinfectants, and quarantine.
13. Hygiene of the battle field.
14. Sanitary appliances.

MILITARY MEDICAL ADMINISTRATION

1. Army Regulations.
2. The Field Service Regulations; organization of the land forces of the United States; Tables of Organization.
3. Manual for the Medical Department.

SANITARY TACTICS

1. Field orders.
2. Map reading.
3. Ballistics.
4. Casualties.
5. Means and mode of evacuation.

6. Summary of personnel, equipment, and supplies of Medical Department organizations from front to rear.
7. Collection and evacuation of sick and wounded.
8. The ambulance company:
 - (a) Composition.
 - (b) Equipment.
 - (c) Administration.
 - (d) Duties in camp, on the march, and in battle.
9. The field hospital:
 - (a) Composition.
 - (b) Equipment.
 - (c) Administration.
 - (d) Duties in camp, on the march, and in battle.
10. The dead, and the rôle of the medical officer.
11. Hippology.
12. Automobiles, their engines, construction, repairs, and spare parts.
13. Sanitary engineering—dugouts, trenches, bombproofs, and construction of their shelter and of sanitary appliances.
14. Gas defense.

SUMMARY

Didactic course:	Hours
1. War surgery.....	40
2. Military medicine.....	25
3. Military hygiene.....	25
4. Sanitary tactics.....	50
5. Medical military administration.....	25
6. Gas defense and chemistry.....	25
Total.....	190
<hr/>	
Practical course:	
Field exercises.....	36
Visit to the front.....	24
Visit to base hospital.....	8
Clinics.....	8
Hygiene.....	10
Hippology.....	3
Automobiles.....	4
Sanitary engineering.....	5
Total.....	98

Total, 288 hours, course of 6 weeks, working 8 hours a day for 6 days a week.

Upon this tentative program, the following course of instruction was formulated and given at the First Corps Sanitary School.⁴

COURSE OF INSTRUCTION FOR THE SANITARY SCHOOL, FIRST CORPS CENTER OF INSTRUCTION
FOR THE PERIOD OCTOBER 15 TO NOVEMBER 3, 1917

Monday, Oct. 15, 1917:

- | | |
|------------------------|---|
| 6.45 a. m..... | Medico-military administration. |
| 8.45 a. m..... | Sketch of Medical Department organization in war. |
| 9.45 a. m..... | The sanitary officer. |
| 10.45 a. m..... | The collection and evacuation of wounded. |
| 1.30 p. m..... | The regimental sanitary organization in general and its equipment. |
| 2.30 to 4.30 p. m..... | Examination of equipment and discussion of its mode of application. |

Tuesday, Oct. 16, 1917:

8.45 a. m.-----	The battalion surgeon in trench warfare.
9.45 to 11.45 a. m.-----	Sanitary inspection.
1.30 p. m.-----	The regimental surgeon in trench warfare.
2.30 p. m.-----	Personal hygiene.
3.30 p. m.-----	Food.

Wednesday, Oct. 17, 1917:

7.45 a. m.-----	Medico-military administration.
8.45 a. m.-----	Problems, battalion sector, trench warfare.
9.45 a. m.-----	The ambulance company.
10.45 a. m.-----	The duties of an ambulance company on the march, in battle, and in camp.
1.30 p. m.-----	Water.
2.30 p. m.-----	The standard United States Army litter; the wheeled litter; the carrying of wounded by hand and by the trench litter.
3.30 p. m.-----	Comparison of French, English, and German regimental organizations with our own.

Thursday, Oct. 18, 1917:

7.45 a. m.-----	Medico-military administration.
8.45 a. m.-----	The administration of an ambulance company.
9.45 a. m.-----	The application of our ambulance company to present methods of warfare.
10.45 a. m.-----	Clothing and equipment.
1.30 p. m.-----	Dugouts.
2.30 to 4.30 p. m.-----	Examination of trenches and dugouts, training section.

Friday, Oct. 19, 1917:

8.45 a. m.-----	The equipment of our ambulance companies.
9.45 to 11 a. m.-----	Demonstration of equipment of ambulance company.
2.30 p. m.-----	Garbage and waste.
3.30 p. m.-----	The motorized and animal-drawn ambulance company compared, and the special application.

Saturday, Oct. 20, 1917:

7.45 a. m.-----	Medico-military administration.
8.45 a. m.-----	The dressing station.
9.45 a. m.-----	The litter bearer group.
10.45 a. m.-----	Shelter, heating, and ventilation.
1.30 p. m.-----	Military administration: Troops, batteries, and companies; interior economy of companies; messing and cooking; company and mess funds; roster; daily service.
2.30 to 4.30 p. m.-----	Problem, sanitary tactics, trench warfare, battle of the Somme.

Monday, Oct. 22, 1917:

7.45 a. m. to 4.30 p. m.---	Practical gas instruction.
-----------------------------	----------------------------

Tuesday, Oct. 23, 1917:

7.45 a. m. to 4.30 p. m.---	Practical gas instruction.
-----------------------------	----------------------------

Wednesday, Oct. 24, 1917:

7.45 a. m. to 4.30 p. m.---	Practical gas instruction.
-----------------------------	----------------------------

Thursday, Oct. 25, 1917:

7.45 a. m.-----	Medico-military administration.
8.45 a. m.-----	The administration of a field hospital.
9.45 a. m.-----	The duties of a field hospital in camp, on the march, and in battle.
10.45 a. m.-----	The application of our field hospital to present methods of warfare.

Thursday, Oct. 25, 1917—Continued.

- 1.30 p. m.----- Consideration in equipment and supplies of a field hospital.
- 2.30 p. m.----- The prevention of typhoid fever, paratyphoid, cerebrospinal meningitis, and diphtheria.
- 3.30 p. m.----- Excreta.

Friday, Oct. 26, 1917:

- 8.30 a. m. to 4.30 p. m.---- Field exercises. French problem on maneuver ground "La-fayette" with field hospital, ambulance company, and regimental unit in liaison.

Saturday, Oct. 27, 1917:

- 7.45 a. m.----- Medico-military administration.
- 8.45 a. m.----- Military administration: The chief of staff; intelligence officer; the adjutant; military correspondence; orders; muster rolls, returns of troops; battle reports, casualties; records; personnel and efficiency reports.
- 9.45 a. m.----- Occupation of buildings extemporized as shelter for a field hospital.
- 10.45 a. m.----- Prevention of venereal disease.
- 1.30 p. m.----- Military administration: Arrest, confinement, and courts; the laws of war.
- 2.30 p. m.----- The specialization of field hospitals in trench warfare—French, English, and German methods.
- 3.30 p. m.----- Disinfection, disinfectants, and quarantine.

Monday, Oct. 29, 1917:

- 7.45 a. m.----- Medico-military administration.
- 8.45 a. m.----- The evacuation hospital and its transport.
- 9.45 a. m.----- Recent advances in prevention of infectious diseases; insecticides and practical methods of delousing.
- 10.45 a. m.----- The field hospital and duties of directors of field hospitals and ambulance companies.
- 1.30 p. m.----- Hippology.
- 2.30 to 4.30 p. m.----- The saddles and bridles of horses and demonstration of the pack saddle.

Tuesday, Oct. 30, 1917:

- 7.45 a. m.----- Medico-military administration.
- 8.45 a. m.----- New sanitary appliances.
- 9.45 a. m.----- The dead and the rôle of the medical officer.
- 10.45 a. m.----- Education and training of Medical Department personnel.
- 1.30 p. m.----- Marches and camps.
- 2.30 to 4.30 p. m.----- Automobiles, their engines, construction, repairs and spare parts; demonstration.

Wednesday, Oct. 31, 1917:

- 7.45 a. m.----- Medico-military administration.
- 8.45 a. m.----- New ordnance in its relation to medical units.
- 9.45 a. m.----- Morbidity and mortality in the military service.
- 10.45 a. m.----- Military administration: Duties of medical officers; the register and report of sick and wounded.
- 1.30 to 4.30 p. m.----- Review.

Thursday, Nov. 1, 1917:

- 7.45 a. m.----- Medico-military administration.
- 8.45 a. m.----- Field orders.
- 9.45 a. m.----- Maps.
- 10.45 a. m.----- Military administration: The sanitary service in war—organization, objects, and duties; the American Red Cross.
- 1.30 p. m.----- Field Service Regulations: Security; marches; combat.
- 2.30 to 4.30 p. m.----- Sanitary inspection, demonstration of bath, and delousing apparatus.

Friday, Nov. 2, 1917:

8.30 a. m. to 4.30 p. m. --- Maneuvers—ground "Lafayette."

Saturday, Nov. 3, 1917:

7.45 a. m. --- Medico-military administration.

8.45 a. m. --- Military administration: Medical Department correspondence, reports, records, and returns in time of war.

9.45 a. m. --- Battle-field casualties.

10.45 a. m. --- Medical supplies in time of war.

1.30 to 3.30 p. m. --- Field Service Regulations: Tables of Organization; administration of zone of interior, of theater of operations, zone of advance, and line of communication; communication; transportation.

SPECIAL SCHOOLS

GAS SCHOOL, FIRST CORPS CENTER OF INSTRUCTION

As noted above, under the program of instruction for the sanitary school, First Corps center of instruction, practical instruction was given in gas warfare. The gas school for this purpose was a part of the center and was under the direction of a medical officer who started instruction on the date the center of instruction was established.³ This gas school was the only one of the gas schools in which the Medical Department participated.⁵

SANITARY SCHOOL, FIRST DEPOT DIVISION, ST. AIGNAN-NOYERS

To meet the requirements of the general training program of the American Expeditionary Forces, which called for training newly arrived members of the American Expeditionary Forces in a depot division, a training school was established in the 1st Depot Division, St. Aignan-Noyers, on March 10, 1918.⁶

Sanitary troops passing through the division to the front, and those on duty in the division, were given instruction in first aid, drill, etc.

Camp Hospital No. 26 maintained a large dental clinic, when in the late spring of 1918 a course of instruction was instituted for enlisted dental assistants.⁶ From here, enlisted dental assistants were distributed throughout the American Expeditionary Forces.⁶

PROFESSIONAL INSTRUCTION

Professional instruction, being entirely intradepartmental, was not considered under the head of training; therefore it was not covered by the activities of G-5, general headquarters, A. E. F., but was conducted in the Services of Supply by the professional services.⁴

Formal courses of professional instruction were conducted at the central Medical Department laboratory, Dijon,⁴ and at the School of Pharmacy of the University of Paris.⁷

CENTRAL MEDICAL DEPARTMENT LABORATORY, DIJON, FRANCE

One of the important activities of the central Medical Department laboratory,^a which was established January 1, 1918,⁸ was concerned with the instruction of medical personnel in certain phases of laboratory technique in

* For an account of the organization and work of the central Medical Department laboratory, other than its instructional activities, see Vol. II, Chap. X, of this history.

order that more efficient service might be rendered by officers so instructed in whatever hospital or other organization they might be detailed to serve. To this end special courses were organized for instruction in (1) the bacteriology of epidemic diseases; (2) the bacteriology of war wounds; (3) shock and resuscitation; (4) water supply work; (5) serology (Wassermann reaction).

BACTERIOLOGY OF EPIDEMIC DISEASES

One of the first subjects to engage the attention of the director of the division of laboratories and infectious diseases was the collection of definite information concerning the transmissible diseases prevailing in the allied armies on the Western Front and likewise in the civilian population in France.⁸ It was learned that we might expect typhoid fever, paratyphoid fever, bacillary dysentery, epidemic cerebrospinal meningitis, the pneumonias, diphtheria, venereal diseases, and other diseases of bacterial origin. The specific etiology and methods of transmission of trench fever were unknown at that time, and it was not anticipated that protozoal infection would give us any particular concern. As all the diseases mentioned above except trench fever, were quite generally distributed throughout the United States, it could be safely inferred that a considerable percentage of the personnel would be familiar with their bacteriology and, furthermore, special courses of instruction covering the bacteriology of these diseases was being given at the Army medical schools at Washington, D. C., Fort Leavenworth, Kans., and Yale University, New Haven, Conn., and at Rockefeller Institute, New York City.⁸ It was presumed, therefore, that the laboratory personnel in general would be fairly well equipped for the bacteriological work connected with infectious diseases. However, while there was no necessity for general routine training in this respect, a careful review of the special qualifications of a considerable number of officers who had been listed as laboratory specialists, indicated that some of them might well take such a course as the one under consideration, with profit to themselves and to the service.⁸ Particular attention in this respect was given to the personnel assigned to divisional laboratories and, when military requirements permitted, to the personnel of base hospitals, practically all of which were provided with men well qualified for the work.⁸

BACTERIOLOGY OF WAR WOUNDS

The organization of a special course in the bacteriology of war wounds was instituted by reason of the fact that soon after our entry into the war the French surgical service had been able to demonstrate that débridement of war wounds offered a very distinct advance in operative procedure, permitting early closure of wounds.⁹ Many of their surgeons controlled their closures by bacteriological examinations. In January, 1918, the surgical advisors of the chief surgeon's office requested that the laboratory service be prepared to do this work for them.⁹ This phase of laboratory activities was developed at the central Medical Department laboratory, and the special course of instruction given consisted of a two-weeks' period of study of aerobes, anaerobes, and streptococci.⁹

This instruction was begun in the central Medical Department laboratory in June, 1918.⁹ Previous to that time various groups of men had been sent to

the Pasteur Institute, Paris, to the center for surgical research of the French Medical Department, at Epernay, to Belfort, and to Dunkirk. The information which formed the basis of the instruction given at the central Medical Department laboratory was obtained from visits, by the director of the course, and other medical officers, to the above-named places, and to La Panne, Boulogne, and Chalons, from published books and reports on the subject, and from reports of the courses of instruction given at the places visited, and from current periodical literature.⁹

The first course in wound bacteriology was a six-day series of lectures and practical work.⁹ The course was lengthened later to two weeks. Nine courses were given, with a total attendance of 138.⁹

It was planned to have in every evacuation and independent base hospital at least one officer, and in each hospital center one or more conversant with this type of work, and when the armistice went into effect this had been accomplished.⁹

The student officers were shown different types of wounds.⁹ They were taught how to obtain specimens from the wounds, and were shown retarded primary suture and secondary sutures. When evacuation was fairly rapid, wounded soldiers arrived at Base Hospital No. 17 (Dijon), within two or three days after injury, sometimes with field dressings unchanged. The student officers were then given an opportunity to see excision and débridement of wounds and to study the bacteriology of the débrided margins of wounds. When amputation was performed for wound infection or gaseous gangrene the amputated limb was taken to the laboratory, dissected before the class, and its bacteriology studied. The same was done with fatal cases of gaseous gangrene, which were autopsied before the class and the bacteriology of wound and the heart blood studied. Wound exudates obtained in this way were taken to the laboratory. Each student officer was required to determine the bacterial count according to the Carrel method, and to isolate the bacteria present and to report on the cytology of the wound exudate. He was further required to give an opinion as to whether his results permitted wound closure or contra-indicated it.

The officers reported only on wounds that they saw clinically and had personally examined later at the laboratory.⁹ Methods for rapid isolation and identification of the organisms whose presence were particularly dangerous in wounds were gone over in detail and applied to the diagnosis of these wound exudates. The classes were all furnished pure cultures of the 20 organisms studied and were required to study their morphology in the hanging drop and smears stained with Gram and special stains so as to demonstrate the presence of capsules in capsulated organisms, flagella, and spores wherever these were present. Each organism was studied with regard to its cultural characteristics in agar, Veillon agar, broth, milk, liver peptone, water, potato, glucose, lactose, maltose, saccharose, mannite, and glycerine. The cultures were studied at 24-hour intervals for 3 days, and the growth was examined in hanging drop and stained smears. Various methods of anaerobic culture were described in detail and the technical difficulties of each method explained. Owing to the lack of the complicated anaerobic apparatus suggested by various workers, and their impractica-

bility under war conditions, it was decided to concentrate upon the technique suggested by Veillon and developed by Weinberg, and to use Veillon agar for solid media and liver peptone water medium for the isolation of all anaerobes in fluid cultures. Other fluid media were boiled previous to use, cooled and calcium sulphide added after inoculation and then covered with sterile paraffin oil.

In this way they were able to isolate nearly all of the organisms described as occurring in wounds and to identify them by means of the culture media and apparatus available under actual war conditions. The serologic characteristics of these organisms were studied, the officers being required to identify various anaerobes by means of agglutinating serum. Neutralization of toxin and of toxic cultures by specific antitoxins were demonstrated. Guinea pigs and white mice were inoculated with lethal quantities of cultures of the various anaerobes and the specific lesions demonstrated. The officers were required to study the bacteriology of the muscle exudate and heart blood of these animals after death. The last three days of the course were devoted to the identification of unknown mixed cultures. These unknown mixtures contained two aerobes and three anaerobes, and the officers were rated, first, according to their technique; second, according to their theoretical knowledge of the subject, as determined by oral examinations held at the end of each week's course; and, finally, upon their identification of the unknown.

Other factors pertaining to the study of wounds were touched on in various lectures. A lecture on ballistics and also on the chemistry of certain antiseptics used in wound treatment were given. Pathological physiology of wounds and the pathological histology of wounds were similarly included so that the student officers could have a general knowledge of the subject plus the special training in the natural history of the bacteria found in wounds. The general principles underlying the preparation and effects of toxin and antitoxin were reviewed, and their application to the treatment of wound infection was described. Wound treatment was gone over very briefly and its relationship to wound bacteriology pointed out. In addition, a certain amount of instruction was given in the preparation of bulb pipettes, sealing of tubes and other manipulations of glass were essential in anaerobic bacteriology.

The course of lectures on wound bacteriology given to the classes during each session, is outlined below:⁹

OUTLINE OF LECTURES ON WOUND BACTERIOLOGY

LECTURE I

a. Program of course.

b. Introduction. General discussion:

(a) Aseptic wound and war wound.

(b) Evolution of subject; wounds of the Balkan wars; wounds of the first year of present war; Carrel's experiment on transplantation; vaccine treatment; introduction of use of Labarraques solution; introduction of Carrel-Dakin method of treatment.

(c) Wound production; factors that enter into the production of wounds.

(1) Projectiles—bullets, shell casing, hand grenade, secondary projectiles (wood, stone, hard tissues—bone and teeth).

(2) Tissues destroyed—soft parts, bony tissues, viscera, serous cavities, vascular tissue.

b. Introduction. General discussion—Continued.

- (d) Structural details and histology of wounds—character on cross section (macroscopic, microscopic).
- (e) Wound infection.
 - (1) Source of infection—projectile, clothing, skin.
 - (2) Type of infection—wound contamination, early, selective; secondary, adaptation, extension; symbiotic; latent.
 - (3) Physical factors favoring bacterial development.
- (f) Bacteria found in war wounds—pathogenic, aerobic, anaerobic; saprophytic; bacterial associations.

LECTURE II

a. Method of obtaining specimens:

- (1) Direct smear.
- (2) Cellophane method.
- (3) Pipette.
- (4) Tampon.
- (5) Excised tissue muscle; granulations; skin; bone.
- (6) Foreign bodies: Projectiles; clothing débris; bone fragments.

b. Where obtained:

- (a) Wound—different parts.
- (b) Surrounding tissue; débridement; vesicle: muscle.
- (c) Blood culture:
 - (1) Vein.
 - (2) Post-mortem—heart, peripheral veins.

c. Technical precautions.

d. Bacterioscopy:

- (a) Direct smear.
- (b) Hanging drop.
- (c) Spread.
- (d) Scaled pipette.
- (e) Staining.

e. Diagnosis of stained smear:

- (a) Morphology of bacteria.
- (b) Staining reactions.

LECTURE III

(Second day—a. m.)

Ballistics:

- (1) Muzzle velocity.
- (2) Shell velocity.
- (3) Disseminated energy.
- (4) Composition of projectiles.

LECTURE IV

a. Pathologic physiology and biochemistry of wounds:

- (1) Aseptic; operative, and war.
 - (a) Necrobiosis.
 - (b) Autolysis.
 - (c) Leucocytic proteolysis.
 - (d) Blood clot.
 - (e) Foreign bodies.
 - (f) Bacterial products—toxins and ptomaines.

b. General significance:

- (1) To wound.
- (2) To life.
- (3) To utility—neuritis, atrophy, painful scars.

LECTURE V

- a. Bacterial counts:
 - (1) Carrel technique—preferable.
 - (2) Modified technique—personal equation.
- b. Cytological examination:
 - (1) Leucocyte curve.
 - (2) Leucocytic index.
 - (3) Mononucleosis.
 - (4) Eosinophilia—significance, technique.
- c. Significance of bacterial enumeration:
 - (1) In retarded primary suture.
 - (2) In secondary suture.
 - (3) Pus—retention and secondary infection.
 - (4) Chemical disinfection.
 - (5) Autovaccination; experience at La Panne.
- d. Comparison of bacterial charts.
- e. Colony enumeration:
 - (1) Slant agar.
 - (2) Veillon tube.
 - (3) Vignal tube.
 - (4) Elser tube.

LECTURE VI

General methods of bacterial isolation and identification:

- (1) Isolation.
 - (a) Aerobic.
 - (b) Anaerobic.
 - (c) Filterable microorganisms.
- (2) Identification.
 - (a) Morphology in solid media.
 - (b) Cultural characteristics.
 - (c) Biochemical properties.
 - (1) Carbohydrate fermentations.
 - (2) Protein fermentations.
 - (3) Peptolytic properties.
 - (d) Serologic reactions—agglutinations, neutralization experiments, complement fixations.
 - (e) Pathogenicity tests—total cultures, filtered or centrifuged toxin.
 - (f) Lesions produced.

LECTURE VII

Aerobic bacteria found in wounds belonging to coccus group:

- (1) Streptococcus.
 - (a) Hemolyticus.
 - (b) Viridans.
 - (c) Nonhemolyticus.
- (2) *Staphylococcus albus*, *aureus* (hemolyticus, nonhemolyticus) *citreus*, *micrococcus candidus*.
- (3) Pneumococcus.
- (4) Enterococcus.
- (5) *Diplococcus Griseus nonliquefaciens*.

LECTURE VIII

Aerobic bacteria found in wounds belonging to bacillary group:

- (1) Organisms of the colon group.
 - (a) *Bacillus coli communis*.
 - (b) *Bacillus Friedlander*.
- (2) Proteolytic group.
 - (a) *Bacillus proteus vulgaris*.
 - (b) *Bacillus pyocyaneus*.

LECTURE IX

Aerobic bacteria found in wounds belonging to bacillary group:

- (1) Spore bearing aerobe group.
 - (a) *B. subtilis*.
 - (b) *B. myscoides*.
 - (c) *B. mesentericus*.
 - (d) *B. anthracoides*.
- (2) Coryne-Bacterium group.
 - (a) *B. cutis communis*.
 - (b) *B. diphtheria*.
- (3) Differential characteristics.
 - (a) Staining reactions.
 - (b) Cultural characteristics.

LECTURE X

a. Preparation of general and special media:

- (1) Egg albumin glucose peptone media (Weissenbach).
- (2) Blood media.
- (3) Liver peptone media (Jablons and Pease).
- (4) Egg albumin media.
- (5) Meat media for spores.
- (6) Veillon media.
- (7) Sterilization.

b. Conservation of strains.

LECTURE XI

Methods for anaerobic bacterial isolation and identification:

- (1) Anaerobiosis.
 - (a) Exclusion of air.
 - (b) Displacement of air.
 - (c) Vacuum formation.
 - (d) Absorption of air.
- (2) Apparatus for anaerobic work.
 - (a) Paraffin layer tubes.
 - (b) Wright tube.
 - (c) Buchner tubes.
 - (d) Pinoy tubes.
 - (e) Anaerobic jar (Bullock, Novy).
 - (f) Vacuum apparatus.
 - (g) Hydrogen apparatus.
 - (h) MacIntosh and Fildes apparatus.
 - (i) Anaerobic plates.
 - (j) Vignal tubes.
 - (k) Elser tubes.
 - (l) Fermentation tubes (Dunham and Fleming).

LECTURE XII

a. Anaerobes encountered in wounds:

- (1) Anaerobes of primary importance.

b. *Welchii* (*B. perfringens*).

- (1) History.
- (2) Methods of isolation.
- (3) Methods of identification.
- (4) Morphology.
 - (a) Staining characteristics.
 - (b) Motility.

b. Welchii (B. perfringens)—Continued.

- (5) Cultural characteristics.
- (6) Biochemical properties—saccharolytic, proteolytic, peptolytic.
- (7) Serological characteristics.
- (8) Pathogenicity (total culture and toxins).
- (9) Experimental infection: Symptoms, lesions.

LECTURE XIII

a. Vibrio septique (relationship to B. malignant edema):

- (1) History.
- (2) Methods of isolation.
- (3) Methods of identification.
- (4) Morphology.
 - (a) Staining characteristics.
 - (b) Motility.
- (5) Cultural characteristics.
- (6) Biochemical properties—saccharolytic, proteolytic, peptolytic.
- (7) Serological characteristics.
- (8) Pathogenicity (total culture and toxins).
- (9) Experimental infection: Symptoms, lesions.

LECTURE XIV

a. Bacillus of toxic edema (B. edematiens, B. bellonensis, B. gas edem (Aschoff), Type XIII, British Research Committee):

- (1) History.
- (2) Methods of isolation.
- (3) Methods of identification.
- (4) Morphology.
 - (a) Staining characteristics.
 - (b) Motility.
- (5) Cultural characteristics.
- (6) Biochemical properties—saccharolytic, proteolytic, peptolytic.
- (7) Serological characteristics.
- (8) Pathogenicity (total culture and toxins).
- (9) Experimental infection: Symptoms, lesions.

LECTURE XV

a. Proteolytic anaerobes of secondary importance:

- (a) *B. sporogenes*.
- (b) *B. putrificus*.
- (c) *B. bifermentans*.
- (d) *B. histolyticus*.
 - (1) Morphology.
 - (2) Cultural characteristics.
 - (3) Biochemical properties.
 - (4) Serologic characteristics.
 - (5) Pathogenicity.

LECTURE XVI

Anaerobes of unusual occurrence in wounds:

- (a) *B. fallax*.
- (b) *B. aerogenes*.
- (c) *B. tertius*.
 - (1) Morphology.
 - (2) Cultural characteristics.
 - (3) Biochemical properties.

LECTURE XVII

- a. Anaerobic streptococci—significance.
- b. Occurrence of the above alone and in symbiosis.
- c. Conditions under which they become dangerous.
- d. Suggestions for the practical examination of unknown exudates.

LECTURE XVIII

Serious wound infections:

- (1) Gas gangrene.
 - (a) Bacteriology.
 - (b) Older conceptions.
 - (c) Recent conceptions.
 - (d) Symptomatology.
 - (e) Pathology.
 - (f) Treatment.

LECTURE XIX

a. Toxin production:

- (1) In different media.
 - (a) Bull and Pritchett (*B. Welch*).
 - (b) Nicolle and Frasey (*Vibrion septique*).
 - (c) Weinburg and Sequin (*B. œdematiens*).

b. Antitoxin production:

- (1) Anti-Welch.
- (2) Anti-Vibrion septique.
- (3) Anti-œdematiens.
- (4) Anti-Bellonensis.
- (5) Polyvalent sera.

c. Animal pathogenicity:

- (1) Lesions produced locally.
- (2) Symptoms of intoxication.

d. Agglutination tests:

- (1) Against antibacterial serum.

LECTURE XX

Serious wound infections (continued):

- (1) Streptococcemia.
- (2) Tetanus.
 - (a) Acute.
 - (b) Late.
 - (c) Post-serum.

LECTURE XXI

Wound treatment:

- (1) Surgical disinfection.
 - (a) Primary suture.
 - (b) Retarded primary.
 - (c) Secondary.
- (2) Chemical disinfection.
 - (a) Carrel-Dakin.
 - (b) Eusol.
 - (c) Mestrezat—acid hypochlorite.
 - (d) Dichloramin-T paste.
 - (e) Phenol.
 - (f) Iodine.
 - (g) Formalin.
 - (h) Dyes—methylene blue, flavine, acroflavine, B. I. P. (bismuth-iodoform paste).
 - (i) Wright hypertonic solution.
 - (j) Alkali.

Wound treatment—Continued.

- (3) Biologic therapy.
 - (a) Serotherapy.
 - (1) Curative.
 - (2) Prophylactic.
 - (b) Antistreptococcus.
 - (c) Leclainche and Vallee—polyvalent.
 - (d) Bull—antitoxin.
 - (e) Weinberg—mixed.
 - (f) Sacquepee—antibellonensis.
- (4) Physical therapy.
 - (a) Irrigation.
 - (b) Heliotherapy—Sun, Finsen ray, electric lamp, ultra-violet ray.
 - (c) Hot-air therapy.
 - (d) Cautery.
 - (e) Ionization.
- (5) Physiologic rest.

LECTURE XXII

- a. Preparation and titration of Dakin's solution.
- b. Determination of antiseptic power of different antiseptics:
 - (1) Phenol coefficient.
 - (2) Thread method.
 - (3) Elser diffusion method.

LECTURE XXIII

- a. Collection of statistical information.
- b. Practical suggestions in case of active work.
- c. Practical suggestions in case of lull in activity.

SHOCK AND RESUSCITATION

Classes of instruction in shock and resuscitation were organized as part of the work of the laboratory of surgical research, which was established as one of the activities of the central Medical Department laboratory.¹⁰ The purpose of this instruction was to give special and essential training to "shock teams" serving in the forward areas.¹⁰

One of the first facts brought out in the course of the early research on shock and hemorrhage was that as blood pressure falls a critical level is reached, below which the circulation becomes so greatly retarded that there is an insufficient oxygen supply to the tissues. Evidence for this was gained through an examination of the blood, which showed that as the pressure fell below the critical level there was an accumulation of acid in the blood which diminished the alkali reserve, and that this diminution was greater the further the pressure fell below the critical level. It is well known that nerve cells are particularly sensitive to lack of oxygen, and it seemed natural to expect, therefore, that when blood pressure is below the critical level damage is being done to nervous structures. Such damage was early demonstrated by the experiments performed in the surgical research laboratory. From these observations it was evident that, in addition to the usual treatment of shock by warmth, rest, and fluid by mouth, there was indicated, in case the blood pressure was not raised through these agents, the necessity of raising it artificially to a point above the critical level in order to avoid progressive damage to important structures.

At the time the foregoing facts were obtained a medical officer on the laboratory staff had begun teaching classes the methods of matching the blood of donor and recipient for transfusion and the use of the transfusion set recently adopted by the Army. Late in May the course in resuscitation was organized, and from that time forward, until November 1, 1918, with few interruptions, classes ranging from 6 to 21 members appeared each week to receive instruction in methods of resuscitation.

The three-day schedule which followed was the basis of the preliminary training for resuscitation work:¹⁰

COURSE OF INSTRUCTION FOR PRELIMINARY TRAINING IN RESUSCITATION WORK FOR THE WOUNDED

FIRST DAY

9 a. m. (amphitheatre, main laboratory building):

Introduction—discussion of circulation in relation to shock and hemorrhage.

10.30 a. m. (physiological laboratory):

Demonstration—

Blood pressure instruments.

Standardization of instruments.

Determination of systolic and diastolic pressures.

Artificial respiration—Schaefer method—Bellows.

2 p. m. (physiological laboratory, laboratory building B):

Lecture and demonstration—

Hemorrhage with blood pressure records—

Natural recovery.

Critical further bleeding.

Treatment with salt solution.

Reinjection of blood.

Hemorrhage with replacement by gum-salt solution.

Amount of blood replaceable by gum-salt solution.

Aseptic operation.

SECOND DAY

9 a. m. (physiological laboratory, laboratory building B):

Lecture and demonstration—

Shock blood pressure—

1. Effects of rebreathing and ether.

2. As a cause of acidosis.

3. As a cause of damage to circulatory control.

4. As influencing the effect of ether.

2 p. m. (physiological laboratory, laboratory building B):

Lecture and demonstration—

Treatment of shock—

1. Adrenalin—temporary.

2. Normal salt solution—temporary.

3. Rebreathing expired air.

4. Gum-salt solution (and blood?).

Resuscitation of the stopped heart.

THIRD DAY

9 a. m. (amphitheater, main laboratory building):

Lecture—

Blood transfusion—

1. General considerations.
2. Direct methods.
3. Indirect methods—
 - Unmodified blood.
 - Modified blood.
 - Preserved red blood cells.
 - Use of anticoagulants.
4. Sodium citrate blood mixture.
5. Incompatibility of bloods.
 - Methods of determination
6. Indications for transfusion.
7. Blood transfusion method adopted for A. E. F.
8. Organization of work.

10.30 a. m.:

Practical work (laboratory building B)—

Grouping of donors.

Practical work (surgical laboratory, laboratory building B)—

Preparation of serum for group determinations.

General conference (amphitheater, main laboratory building).

Naturally, as more and more experience was obtained in teaching, in research, and in the work of the resuscitation teams at the front, the methods of instruction became amplified and improved. The following account is based upon the above program, which was followed during the latter part of the period:¹⁰

Three days were devoted to the instruction. On the first day the director of the research laboratory met the members of the class and gave them an outline of the work which they were to perform. He described to them the characteristic features of shock, and brought it into relation with hemorrhage. He then emphasized three points which had practical importance in the treatment of shock: (*a*) Distribution of blood, (*b*) acidosis, and (*c*) sensitiveness to anesthetics. In connection with the concentration of blood in the capillaries, the effect of cold in causing similar concentration afforded a rational explanation of the deleterious influence of loss of heat in augmenting the condition of shock, and gave opportunity for discussing the various means which may be employed to check loss of heat, and to restore to the shocked man the heat which has already been lost. The development of acidosis in shock, when the pressure has fallen below the critical level mentioned above, was the basis for considering the physiology of the circulation in relation to tissue needs, and the importance of keeping the head of pressure in the arteries high, in order to provide a circulation adequate to these ends. The fall of pressure accompanying anesthesia and operation made the basis for discussing the methods of obviating the influences dangerous to the shocked man which attend operation, and the aid which the resuscitation officer may give the surgeon when about to operate on such a man.

After this introductory discussion of shock and hemorrhage, the classes reported to the laboratory, and there had demonstrated the various means of measuring arterial blood pressure. The members of the class were then required to determine blood pressure on a subject, and their results were compared with the results of an expert. If some members made observations markedly discrepant, they were asked to repeat their readings till a common judgment was agreed upon by all. The class was then given instruction in various methods of providing artificial respiration. The work thus far described consumed the morning of the first day.

The afternoon of the first day was devoted to a study of hemorrhage. The method employed was that of gathering the class about a demonstration table, and showing them the blood pressure being recorded directly from an animal under anesthesia. During the course of the demonstration, the effect of hemorrhage in causing a fall of blood pressure was shown and discussed by the class, as was also the natural recovery which usually follows, except in the most severe bleeding. The class was also shown how, after such recovery, the loss of even a small amount of blood might turn the scales against recovery, and the moral of this in teaching, that every effort should be made to avoid absolutely any unnecessary loss of blood from wounded men, was strongly emphasized. After the blood pressure had been seriously lowered by hemorrhage, the purely temporary effect of salt solution injected into the veins was compared with the permanent effects which could be obtained when the blood taken from the animal was reinjected. Later, hemorrhage was again produced, until the pressure was very low, and the volume thus subtracted from the animal was replaced by Bayliss's solution of gum acacia 6 per cent in sodium chloride 0.9 per cent. The permanent rise of pressure which this solution gave was compared with the temporary rise resulting from the injection of pure salt solution. The difference between the two afforded opportunity for discussing with the class the claims made by Bayliss for his colloidal preparation.

In order that the possibilities of the use of gum-salt solution as a substitute for blood volume might be realized, 60 per cent of the estimated blood volume was removed by venesection, with aseptic precautions, from a dog under anesthesia, and the amount replaced by the warm colloidal solution, introduced slowly. With only two exceptions in the whole series of demonstrations it was possible to show the animal the next morning to the students, and even two or three weeks later, in perfectly normal condition. The importance was pointed out by using the artificial solution to replace blood as early as possible after the blood was lost.

The second day was wholly devoted to demonstrations as to the nature of shock, and to discussions between the instructor and the members of the class regarding the phenomena as they occurred. Two methods were employed to bring about the state of shock. Early in the instruction shock was induced by a persistent low pressure caused by increased intrapericardial pressure. Later, shock was induced as a result of tissue damage. By testing with the Van Slyke apparatus samples of blood taken before shock was induced, and after a low pressure had been developed, the influence of low pressure in causing acidosis was demonstrated. In this connection the critical level of a falling

blood pressure, and the urgency of not permitting the pressure to remain long below this level, were again emphasized. The failure of blood pressure to rise after it had been kept low through prolonged intrapericardial pressure, showed the damage to the control of the circulation induced by the insufficient supply of oxygen. Naturally, these demonstrations required some hours for their completion. During this time the physiology of the circulation, the function of high arterial pressure, the change in the circulation wrought by low pressure, the effects of a low pressure in diminishing the oxygen delivered to the tissues, the nature of the consequent acidosis, and the theories of shock were discussed by the instructor and by the members of the class. The exercise was as informal as possible, and, when the classes were small, there was no restraint manifested by the members in asking questions, and in bringing out points which seemed to require further consideration. There was definite advantage thus obtained by giving time for observations and ideas to get a firm setting in the minds of the students.

During the afternoon of the second day the treatment of shock was considered, and, as far as possible, demonstrations were given on various suggested agencies. The temporary influence of adrenalin was recorded as well as the temporary rise obtained by injecting normal salt solution. The rebreathing of expired air was shown to have no value or even a harmful effect. The rise of blood pressure through the use of colloidal solution or blood was then discussed. If the state of shock had not continued for too long a period, so that tissues were disastrously injured, it was possible to demonstrate the permanent rise of arterial pressure which could be obtained by the injection of such fluid.

The effect of ether in causing a striking fall of arterial pressure, when it is administered even to a degree which is barely sufficient to abolish simple reflexes in the shocked organism, was demonstrated. To some classes the markedly different effect of nitrous oxide and oxygen as an anesthetic was shown; through this agency it was possible to produce the same degree of anesthesia as that produced by ether with no fall of blood pressure whatever.

Finally, the animal, which had been in a state of shock even for 15 or 16 hours, was killed by asphyxiation; the recording apparatus showed that the blood pressure had fallen to zero, and that the heart and respiration had ceased acting. Now adrenalin in salt solution was injected into the carotid artery, the heart was massaged through the chest wall, and artificial respiration was administered, and in a few moments the blood pressure usually mounted to 150 mm. of mercury, where it was sustained sometimes for many minutes, with no indication of cardiac failure. This demonstration was made the basis for considering the use of a therapy sometimes employed in stimulating the heart in order to raise arterial pressure. It seemed clear from the demonstration that there was no indication of cardiac failure as an essential causal factor in shock.

After the first two days had been spent in becoming acquainted with the physiology of hemorrhage and shock and with the essential disturbances wrought in the organism by conditions which these states induced, the classes were taught, on the third day, the practical methods of dealing with these states. The instruction consisted in discussion of the fundamental principles underlying the transfusion of blood, especially with reference to the tech-

nique employed, and to reactions which might result if donor and recipient do not belong in proper blood groups in relation to one another. The surgical service had previously selected the method of employing citrated blood; the principle of this method was described, and the transfusion set used in carrying out the method was demonstrated. Since the ease of transfusion depends largely on the condition of the needles which are used, the care of the needles was described in full. The indications for transfusion were then again considered with reference not only to the experimental work of the previous days, but also with the reference to other resuscitation measures which are employed; and finally the proper organization of activity in a resuscitation ward was presented.

After hearing this discussion the class went to the laboratory, where they were divided into groups; one group engaged in matching their own blood against type sera, another in sharpening needles and learning practically the method of keeping needles in proper condition, and another in using the transfusion set on an anesthetized animal. In this last experience the blood was removed from the jugular vein on one side and introduced into the jugular vein on the other. A long exposure of the veins permitted many repetitions of the experience on the same animal. After these exercises there was no reason why any member of the class should have excuse for not being able to employ intelligently the transfusion set.

In the afternoon of the third day the class was taken to Base Hospital No. 17, Dijon, where they engaged in grouping the blood of patients, and, when possible, in withdrawing blood which was later used for the preparation of the sera sent out in the transfusion sets. Thus such members of the class as had not had previous experience in "needling" human veins had opportunity of learning under supervision.

The members of the resuscitation teams were almost exclusively selected from the medical personnel of base hospitals. The theory of this arrangement was that these men would return to their stations, and there each one would associate with himself an orderly and a nurse, who would go to a forward hospital in times of activity to form one of two teams to work in the resuscitation ward of that hospital. Practically, this scheme worked well in certain cases; in other cases, however, the prospective activity was anticipated by the commanding officer of the base hospital, and objection was raised to the separation of the medical officer for forward work at a time when the staff of the base hospital might be heavily burdened. The consequence was that, in spite of the large number of men from base hospitals who were trained, it was difficult to get a sufficient number of resuscitation teams, and in some degree the shock wards of forward hospitals were manned by persons who had not been trained in this laboratory.

Ever since the evidence had been obtained in May, 1918, of the progressive damage done to the control of the circulation through persistence of low blood pressure, emphasis was laid on the early treatment of shock. Late in May the director of the laboratory visited the divisions then in the line, the 26th, 42d, and 32d, and spoke to the medical officers of these divisions on the importance of dealing early with the conditions presented by the shocked men. Fortunately, the simple measures of rest, warmth and hot fluids given by mouth are often

highly effective, and can be used near the fighting lines. These measures, with proper blanketing, will greatly reduce the degree of shock, and if consistently employed will give the badly wounded the best opportunity in the stress of transportation. Repeated efforts were made to bring instruction to the medical officers of divisions—the first officers to care for the badly wounded—but these efforts were largely fruitless. Reports coming from several sources revealed that during the cold weather of late October and November the wounded were being sent on long ambulance journeys with improper blanketing, due, not to lack of blankets, but to improper arrangement of them. Clearly there might have been more satisfactory treatment of the wounded if methods of resuscitation had been more thoroughly taught to the divisional medical officers.

To some extent it was possible to reach these officers in the classes at the Army Sanitary School, Langres; every month one or other member of the teaching staff presented to these classes a brief summary of the work which was given in detail to the classes that came to the laboratory. Late in October, 1918, arrangements were made to have these classes sent in squads to Dijon for more thorough instruction.

In connection with the activity of resuscitation teams, it was deemed advisable to have some sort of oversight of the use of the information which had been given them and the methods which they had been taught. For this reason visits were made to hospitals north of Chateau Thierry in August and in the neighborhood of the St. Mihiel salient in September by the director. The hospitals in the region west of Verdun were visited by an officer of his staff. It was early found that the corps consultants in medicine naturally took upon themselves the function of continuously overseeing the work of the resuscitation teams. By their cooperation, and also by the visits made to the front by members of the laboratory staff, information was obtained as to difficulties which were being encountered, and suggestions were offered as to means of meeting these difficulties.

WATER SUPPLY

After September 27, 1918, when the water-supply section of the central Medical Department laboratory was organized, special training in water-supply work was given to the division water-supply personnel.¹¹ The instruction was practical in character and related more particularly to water surveys, proper methods of determination of water supplies, and the simple chemical tests to be used to check and supervise chlorination.^b

SEROLOGY

The special course in serology was instituted for the purpose of standardizing, so far as possible, the Wassermann technique and giving instruction to laboratory officers who would be required to do this work as part of their routine duties.⁹ The centralization of Wassermann work in a few laboratories was desirable, but the unavoidable delays in mails and lack of transportation for courier service prevented the degree of centralization that was desirable.

^b For a full discussion of this subject see Vol. VI, Sanitation, sec. "In the American Expeditionary Forces," Chap. VII—Ed.

GAS INSTRUCTION FOR DIVISION MEDICAL GAS OFFICERS

It proved necessary to give to medical officers who were to become divisional medical gas officers instructions in the professional care of gas casualties. This was authorized August 29, 1918.⁷ Subsequently, as division medical gas officers were appointed, each was sent to the school of pharmacy of the University of Paris (École de Gaz) for a four-day course of instruction before being assigned to his respective division for duty.

For details concerning this school course, as well as additional instructions which medical gas officers received, consult Volume XIV of this history.

CHAPTER X

ARMY SANITARY SCHOOL

MEDICAL SECTION

ORGANIZATION AND INSTRUCTION

The Army Sanitary School was organized in accordance with the general school project for the American Expeditionary Forces, involving army and corps schools and divisional training, which was approved August 30, 1917.¹ (See pp. 571 and 572, in the preceding chapter.)

FIG. 33.—Army Sanitary School, A. E. F., Langres

The original plan of conducting this school at the 2d Replacement Division of the First Army Corps, together with other Army schools, and of employing it for the training of instructors for corps schools, was never extensively carried out,² but in October, 1917, the Army Sanitary School, among other Army schools, was ordered to be established at Langres.³ The commandant reported for duty November 1, 1917,⁴ and the school was opened December 3, 1917.⁴

While, from time to time, a few graduates of the school were recommended, in accordance with the original plan, as instructors for corps schools, the major

purposes of the Army Sanitary School, as finally evolved, were: (1) To train selected officers from each division, who would return to their organizations and instruct their colleagues; (2) to collect information concerning the work of the Medical Department in war and to distribute this information in mimeographed pamphlets throughout the American Expeditionary Forces.⁴ (See Appendix.) For the accomplishment of these purposes, courses which had been proposed by the commandant and approved by the chief surgeon, A. E. F., were employed.⁵

When a copy of the original memorandum for training medical personnel, American Expeditionary Forces, reached the Surgeon General, it called forth the following suggestions concerning the coordination of training of Medical Department personnel at home and abroad.⁶

1. In connection with your letter to General Birmingham of November 12, 1917, on the subject of Medical Department training overseas, and the attached data, including the general scheme of training all troops overseas and the detailed course for medical officers in France, the following information is furnished for your information as to the nature of the instruction being given in this country and for consideration as to the proper relation between it and the training done abroad.

2. Training of the Medical Department in the United States is based on a comprehensive plan to reach all personnel, commissioned and enlisted, wherever they may be serving. All are being materially benefited. The relative degree of efficiency depends on local opportunity, equipment, and thoroughness of instruction and supervision.

The instruction everywhere is coordinated, and is the same where conditions permit.

A certain scope of basic information is necessary for all officers and for all enlisted men. This is approximately the same in all the courses later referred to, but the time allotted thereto is not always the same for different courses preparing for different varieties of duty.

3. Instruction is given through the following channels:

(a) Departmental. Required per circular letter, Surgeon General's Office, of May 14, 1917, to all department surgeons.

(b) Medical officers' training camps. Required per circular letter, Surgeon General's Office, to commandants of medical officers' training camps, dated May 15, 1917.

Also by Special Regulations 49a, War Department, 1917.

(c) In all organized divisions. Required per circular letter, Surgeon General's Office, to all division surgeons, dated October 3, 1917.

(d) In all base and general hospitals. Required per letter, Surgeon General's Office, of October 15, to all hospital commanders.

This letter was further supplemented by memorandum, Surgeon General's Office, of November 15, to all hospital commanders.

(e) For the training or elimination of all substandard medical officers. Required per letters, Surgeon General's Office, to all department and division surgeons, and to all hospital commanders. Both letters dated December 14.

4. The so-called basic course of three months in training camps was developed primarily for the training of sanitary personnel for service with fighting troops in the zone of operations. This need has now largely been filled by the creation of most of the sanitary organizations required for the troops authorized under existing law.

However, a considerable number of officers and men are continually needed for replacement purposes, and enough are being given this basic course to meet all such needs. This three months' course is also more thorough and satisfactory than the special courses of two months, later referred to. As all personnel is conceivably liable to this service with fighting troops at the front, if time permitted all would receive this three months' course and be given any special instruction necessary to lines of communication formations in addition.

After a four months trial of the same, Colonels Page, Ashburn, Persons, Bispham, and Lieutenant Colonel Bingham, commanding the several medical training camps, in conference decided that the basic course for such camps, prescribed in Special Regulations 49a, met all needs and should not be changed. It has now been tried out for seven months and no need for change has as yet been presented in this country.

5. A shorter course than the so-called basic course is given to personnel to be assigned to duty with formations intended for line of communications work. This course is of two months. It leaves out a considerable amount of training which relates especially to service with fighting troops, and at the same time adds somewhat to the professional training.

Present plans contemplate that at the conclusion of this two months line of communications course, such organizations as evacuation hospitals and base hospitals will have their personnel as a unit attached as supernumeraries for about one month prior to embarkation at fixed base hospitals. This will give them practical training in hospital management and care of patients. This plan is suspended for the present for lack of available accommodations surplus at any suitable base hospitals.

6. Around the basic course of the training camp, and the condensed course for line of communications service, a number of special schools to supplement the former have been established. These latter are largely professional, but have the purpose of training officers to be specialists along certain lines for military purposes and in the military environment and under its limitations.

The special schools thus already established include:

- (a) School of applied military hygiene and camp sanitation.
- (b) School for military roentgenologists,
- (c) School for military orthopedists.
- (d) School for military psychologists.
- (e) School for military sanitary engineers.
- (f) School for laboratory workers.
- (g) School for veterinarians.
- (h) School for internists.
- (i) School for hospital administrative officers.
- (j) Schools for military surgeons, general and regional.
- (k) Practitioners courses in laboratory work.
- (l) School for military dentists.

* * * * *

(8) (a) The hospital facilities at Medical Officer's Training Camp, Fort Oglethorpe, where there is a general hospital, as at present planned, will aggregate 2,500 beds. But it is proposed to expand this to any such number as may be required to furnish abundant material for clinical courses and adequate instruction. It is well located to be expanded to 4,000 or more beds.

Selected cases are to be sent to Fort Oglethorpe for this purpose from the 10 great camps, with their soldier population of some 400,000, which are located within a night's run of Fort Oglethorpe; which latter will, in addition, have its own population of 35,000 to 40,000 to draw upon.

Cases from overseas will further be sent to the reconstruction hospital to be operated here.

The plan is to make it the greatest clinical center, as well as medical training camp, in the world.

A selected staff of experts, drawn from the best medical centers, will conduct the clinical and other professional work.

(b) At the present time, there are about 1,400 cases under treatment in the general hospital at Fort Riley. No expansion of clinical facilities here, beyond local supply, is contemplated if this training camp can be merged in the one at Fort Oglethorpe, as mentioned in paragraph 10 herewith.

9. Whether or not all basic training can be done in the United States before embarkation depends on the size of the training facilities authorized here.

At this date there are about 2,600 medical officers under instruction in medical officers' training camps, or actually under orders to proceed there.

There are about 8,000 enlisted men of the Medical Department similarly under training at medical training camps, and this number is rapidly to be increased. Ten thousand more drafted men are expected at them on February 15.

The facilities at Medical Officers' Training Camp, Fort Oglethorpe, immediately in sight, are as follows:

Now occupied, cantonments.....	6, 000
Tent camp under rapid construction.....	6, 000
Artillery cantonment just being turned over.....	1, 500
	<hr/>
	13, 500

The facilities at Medical Officers' Training Camp, Fort Riley, immediately in sight are:

Now occupied, cantonments.....	3, 500
Just ready to occupy, cantonments.....	1, 500
Ready in three weeks, gunsheds converted into barracks.....	1, 500
Tentage.....	400
	<hr/>
	6, 900

Total, both camps, 20,400.

10. However, the Medical Department has asked that it be given all of the structures and facilities at Chickamauga Park and Fort Oglethorpe. These are now accommodating over 35,000 officers and men, mostly of line organizations. If all these accommodations become available, the Medical Department will concentrate all training there. In the meantime, it will need to maintain the camp at Fort Riley also.

11. For present purposes, the medical officers' training camp in this country can be counted on for the following:

(1) To give basic training and special instruction to all medical officers hereafter entering the service.

(2) To organize all sanitary formations created in this country, and to fundamentally train the officers and men composing their personnel.

(3) To train more than one-half of all other enlisted men of the Medical Department entering the service.

The remainder will have passed into the service direct to divisions, hospitals, etc., and received their training there.

12. If the Medical Department gets all the accommodations at Chickamauga, it will endeavor to send all enlisted men, as well as all officers, through the training course there.

13. The general plan for the early development of a single great medico-military training center in the United States is embodied in memorandum for General Birmingham, dated January 11, entitled "Final policy for training officers and men of the Medical Department."

14. The general plan of the training committee, General Staff, looks to the separate training of each arm or branch of the service by itself in this country, with combined training of all branches and arms in the camps abroad.

The Medical Department plan agrees with this, except that its personnel under instruction may have the benefit of association with a certain number and type of line troops in this country. If such opportunity for combined training exists in this country at or near the medical officers' training camp, the Medical Department will, to a reasonable extent, take advantage of it.

15. As far as possible, it is believed that nearly, if not all, training in theory, and some at least of the training in practice, should be done in the United States.

On going abroad, the individual should already have received his fundamentals of instruction and be able to intelligently participate at once in the application under special conditions of the general principles he has learned.

16. The school abroad should thus be primarily a school for advanced students, both officers and men, and should further be especially a school of practical application.

17. The general idea of the relation which it would seem desirable should exist between the training facilities of the Medical Department at home and abroad is given in memorandum for General Birmingham, dated December 28, entitled "Training of Medical Department at home and abroad."

18. It is possible that necessities of the service may require that a certain number of uninstructed men, and a still larger number of only partially instructed men, shall be sent abroad from time to time. Insufficient training facilities in this country and shortness of time has made such action necessary in the past.

Such men, of course, will need training overseas in theory and practice, according to the nature and extent of their deficiencies—and for them a suitable course, probably closely approximating the instruction given in this country, should be maintained overseas.

But this last course should be regarded merely as incidental to the main school, which should be one of application for advanced training of personnel grounded in their fundamentals in the United States.

19. The courses of training overseas should take into consideration the courses given here, and information should be required of new arrivals as to the nature and extent of their previous training in this country. Repetition of training in a subject, if satisfactorily understood, and duplication of effort, should of course be avoided.

20. It is requested that the training overseas be so amended as to give full consideration to the preliminary training here.

Also that this office be informed as to the manner in which the courses of training in this country should be amended so as to better coordinate with the training carried out by you and needs of the service abroad.

The following reply to the above communication not only shows clearly wherein and why complete coordination of Medical Department training in the American Expeditionary Forces with that in the United States was impracticable, but it gives a lucid exposition of the purposes and methods of the Army Sanitary School:⁷

The inclosed letter reached me for the first time 24 hours ago, due to the fact that I was on a tour of instruction at the British front with 25 medical officers, and have just returned.

The programs of instruction for the Medical Department in the United States have been gone over with care, and it is believed that the best interests of the service are subserved in the manner in which these programs are being carried out, as there is neither time nor opportunity to train men in many of these subjects where their services are needed in the trenches. A knowledge of the regulations and record keeping of the Army, and a full knowledge of drill with its effect in disciplining officers and men, is keenly appreciated by those of us here who literally are unable to do this work without neglecting exigencies of war service, and, in general, with the exception of some men hurriedly sent with base units, this intensive training has produced remarkable results.

As a matter of fact, when this school was organized a plan of the commandant, submitted to the chief surgeon and approved by him, was to teach the methods necessary for our Medical Department to render its best service in this war, and as this has been a war of trenches up to the present time this phase was chiefly taught. * * * It is believed that in general the plan of this school in France should be continued, namely, that the actual working out of not only our own, but the system of other armies, should be demonstrated practically where war is being carried on, in the front lines of the armies and the lines of evacuation. To this end classes of selected students have been carried up to live for three weeks under these conditions, and the aid of both the French and British Armies has been solicited, not only to give practical talks, where the substance of their remarks could be demonstrated on patients and terrain, but where our officers would be able to visualize the difficulties at the same time that they are furnished with the solution. The school has been unique in that the spirit of the students has been kept at its very highest pitch under the stimulus of the war going on about them. Much of the data they have secured have been obtained from the immediate front, from the first line trenches back to the casualty clearing stations or evacuation hospitals, where they lived during their stay, often under fire and at least once of great assistance to their hosts in sudden emergency.

Shortly after reaching France, while yet division surgeon of the 1st Division, I drew up a program for the instruction of officers and men of the Medical Department. * * * In addition to this program, and at times in substitution for this regular routine, Medical

Department troops were ordered, at favorable opportunities, to take part in combined operations of battalions, regiments, and the whole division, which had, itself, set about vigorous training of its combatant units. In addition to this, medical officers were assembled each Saturday afternoon for instruction at 3 p. m., and in spite of the difficulties attendant thereon, owing to the great lack of transportation in the area covered by the division, 15 miles long and 10 miles broad, there was given an opportunity for interchange of opinion as well as to hear various invited surgeons, chiefly of the French Army, on vital subjects connected with the medical services in war. Some of these lectures, especially those of Aide-Medecin-Major Bernard, were of extreme value. I was fortunate in having an office with the division surgeon of the 47th Chasseurs, Colonel Cultin, who took such a great interest in cooperating with us that he at one time spent an entire day with us inspecting the personnel and equipment in detail of the medical units of his division, the divisional units under his command being brought up in military formation at one spot for this purpose. On another occasion, after a week of hard labor, he staged a field exercise involving battalion aide stations, regimental aide stations, and ambulance company evacuation, at full distances, with dug trenches and marked routes of evacuation; and the influence and instruction received from this officer is reflected in a "Report of a visit made to the French front, per instruction of commanding general, 1st Division," section 3, "Personnel and equipment of regimental and divisional sanitary organizations of French Army"; section 4, "Recommendations of changes which should be made in sanitary organization of the American Army," submitted about September 6, 1917. The success of all of the schools of the 1st Division in rapidly training their men led, I believe, to the establishment of the present school system. Up to this time we had but one ambulance company and field hospital, both of which were involved in serving the routine medical necessities of the division—the one being used to man the divisional camp hospital, the other to evacuate the sick from the numerous cantonments in which it was situated to that hospital. In addition to this, after a preliminary visit of the division surgeon to a French sector in our vicinity, authority was secured from the chief surgeon for a visit of two weeks to the British front of about 20 per cent of our medical officers.

On October 15, 1917, the First Corps Sanitary School was established as one of the corps schools in the heart of the 1st Division, and I was relieved as division surgeon to become its director. Over half of this course was a practical one in the field, many of the so-called lectures being demonstrations. By this time two more ambulance companies and two more field hospitals had reported and were used in field exercises and problems as per program, the intrenched positions being the ones actually dug for the use of the division. Apart from this, a number of Medical Department dugouts were built by the divisional sanitary troops under the general supervision of the Engineer Corps and the French Medical Corps. On November 3, before the course had been finished, it had been the plan to have a course of five weeks for each class in the Corps Sanitary School, but at the end of the first three weeks I was ordered to the Army schools to become commandant of the Army Sanitary School, and left November 3. The course, which was to have continued at Base Hospital No. 18, was in my absence abandoned, due I was informed to an epidemic of scarlet fever there.

I was informed that plans for this school should be based upon the principle that at least 100 medical officers at a time would attend, and that these would be field officers, and I was instructed to make plans which should embrace not only the higher branches of practical work but which should reach out into all of the specialties pertaining to the Medical Department. The plan was to have a division of troops cantoned in the vicinity of the school, which, at the same time it was being trained, would serve as a means of instructing students who came to the school, and that the population of the school area would, in addition to the division, be about 15,000. Upon this information I based the tentative plan, heretofore referred to, but on reaching the school area it became evident that for the present at least the school could not reach the proportions first contemplated by the officers directing the training section. Accordingly, a memorandum to the chief surgeon was forwarded, and approved, and upon the main features of this memorandum the school is now working, although it seems probable that much of the original plan will be attained as the base hospital of 2,000 beds, the division sanitary train complete, medical supply depot, and the hospitals for officers and men, and

dispensaries, are to-day facts, although the base hospital and the division sanitary troops have no relation to this school, with which they are actually in contact. The important change is that the entire class receives the same instruction. Instruction in military medicine is provided by the commandant in addition to his other duties.

The school, at present, is in a comfortable building used as a young girls' school and conjointly with them, but the lack of sufficient accommodations, on the one hand, and the difficulty of getting student officers in the numbers at first contemplated, on the other, somewhat changed the actual working plan of the school as at present carried out. It was decided to make the school a place of instruction for selected medical officers in a position to spread information which could not be attained by the reading of books or papers, or from the divisional or corps schools. Moreover, it was considered that the work of this school should be distinctly separated from training for which other provisions and another bureau was provided. The object of this school was to give information by practical talks and demonstrations as well as tours of instruction at the front and not to attempt long training periods. It was believed that no base or line of communications medical officer could be of such efficiency as the conditions of this war required until he could visualize the scenes and conditions from which his patients came, and vice versa. In this manner the school aimed to coordinate all parts of the medical service and bring about cooperation between front and rear, the lack of which caused much confusion and not a little suffering in times past in the armies of our Allies. After this bird's-eye view of the entire medical department from front to rear, with concentration of attention on vitally important features, all medical officers would be in possession of enough basic knowledge of any part to enable the chief surgeon to call upon anyone to serve in either front or rear. The training of these officers in their specialties could be taken up by some other bureau or be later provided for as a branch of this school. This allowed the staff of the school to concentrate their attention upon the vital and pressing matters connected actually with this war, and it was determined to make this instruction so practical that everything taught could be actually demonstrated. Accordingly the first class was taken to the British front, stopping a few days in Paris to receive a preliminary course in the best known military hospitals of that city, and in the fracture hospital commanded by Colonel Keller, one of the instructors. The British Army invited us to take our course at the school of instruction of the Royal Army Medical Corps for the First Army. We were quartered in a casualty clearing station about $4\frac{1}{2}$ miles from the lines. On the last night of our stay, after heavy bombardment, the class furnished operators to assist in that hospital.

The second class began January 10, 1918, and this time a tour of instruction was arranged with the French and the class proceeded to the school of instruction of medical officers of the Fifth Army. The notes on this course have not yet been completed, but it was an extremely valuable one.

As a result of these two expeditions very strong and lasting relations of cooperation were established between the British and French Armies and ourselves.

The present class is now just completing its course, the third of this school, and has just returned from a tour of instruction in the school of the Royal Army Medical Corps for the First Army, which had been sufficiently varied from the first course to present features not heretofore covered, inasmuch as a most thorough demonstration of all of the lines of communication and base were included, even to the inspection of hospital ships ready to sail for England. The report of these two courses will be forwarded in due time.

The policy of this school at the close of this course will change,^a in that it will be limited to one month, the students will be increased from 25 to 50, 25 having heretofore supplied the demand, but now it is believed that 50 students can be spared from their actual duties at the front. At the conclusion of this course 25 students will be selected, in order of merit and aptitude from this class, to make a two weeks' tour of instruction as other classes have made.

Compared with the large training activities in the United States, the number of students who have passed through this school seems small, but in analyzing its results one should consider its functions. This school has the same relation to the Medical Department as the General Staff School has to the Army. The general instruction in divisions provides for all Medical Department personnel in the field, the corps schools prepared instructors for the

^a See communication from the adjutant general, general headquarters, A. E. F., to the commandant, Army schools, *ra* Army Sanitary School, Mar. 4, 1918, *infra*, p. 622.—*Ed.*

divisions, and the Army Sanitary School (whose number of students is about that of the First British and Fifth French Army schools visited) prepared instructors for the corps schools. As a matter of fact that has been exactly what has happened. Before the Army Sanitary School existed the 1st Division supplied practically all of its instructors. After this the Army Sanitary School provided the main part of the instructors for the Second Corps school. Now with the abolition of the corps schools this army school will provide not only all instructors for divisions directly, but will furnish those for units in the line of communications.

From the first all students to this school are required to take full notes on all lectures, demonstrations, and visits to the units of allied armies; the commandant has accompanied each expedition with at least one, and later two, of the faculty, and has done likewise. At the end of each course these notes are all written into a composite form by the faculty and mimeographed. The proceedings of each course will be furnished each division for permanent record and enough are supplied heads of large medical units and the general staff to secure liaison. Not only this, but it is the intention to place all alumni upon the mailing list of the school for literature in subjects not treated heretofore.

In short, the present system has been based upon the principle that only those matters which could not be secured by instruction in the United States, in divisional areas, and in the corps schools should be handled here. It was long ago felt that corps sanitary schools rather complicated than helped the system of instruction that we were attempting to make possible for medical officers, and in fact these corps schools, not only in the medical department but of all arms, have been abolished. There is no time for drilling, paper work, or supplemental instruction, and as will be seen from the programs, the five great subjects taught are the tactical disposition of sanitary units, military administration of the medical department (meaning thereby the liaison between medical units, administration of organizations in the lines of communication, etc.), military hygiene as applied to this war, military surgery, and military medicine.

In addition to the record of the first course of this school, certain papers and notes are hereto added for information and distribution in the schools of the Medical Department of the United States. Some of these papers refer to lectures and demonstrations in the second and third courses of the school, and one especially—the translation of a lecture by Lemaître—will probably be a classic, inasmuch as he was the first to practice the so-called primitive suture and surgical sterilization of wounds.

Other notable papers, also original and appearing for the first time (as in fact most of these papers do) are: "Notes on the Battle of the Somme," furnished on request of the commandant by Lieutenant Colonel Cordillot, division surgeon of the 18th Division, French Army, made by him from a diary he kept at the time. "The organization and operation of aid stations in army corps and litter-bearer groups," by Aide-Medecin-Major Collin, containing excellent plans for regimental dugouts. "The function, rôle, and methods of the division surgeon," by Lieutenant Colonel Theoris, division surgeon, French Army. "Duties of the regimental medical officer during an advance," by Major Griffin, English regimental surgeon.

It is quite unnecessary to state that all of the material received from the British was so valuable as to make it impossible to point out one in preference to others; but the chief value of these papers lies in the fact that the subject matter therein treated has to a large extent been verified by demonstration. In fact, the course with the French was carried out at an evacuation hospital for a sector of the French lines of 3,000 beds where wounded were being constantly received, and much of the instruction not provided for in the program was given by Professor Lemaître and Professor Leriche in the operating rooms and wards, at all hours of the day and night. It is believed that the surgical experience gained in these demonstrations has already had a tremendous influence in putting into practice one of the greatest advances in military surgery—the primitive and the primitive retarded suture and its limitations. It is unfortunate that larger groups can not be taken to these lines, and more frequently, but, naturally, 25 is the extreme number that can be accommodated at any one time, and, besides, in the future the activity of our own troops will henceforth furnish a large amount of future instruction, this not having been possible heretofore, as it is only comparatively recently that our troops have become consolidated on the line. I can only state the self-evident fact that the excellence and uniformity of the British and French medical service comes mainly from its school system.

In addition to the Army Sanitary School, this school has under its supervision the Army Dental School, with a course of two weeks, and our officers cooperate with them, as theirs do with ours, on those branches of medicine and surgery which affect both. The course is two weeks. There is a director and two assistants—1 colonel, 1 major, and 1 first lieutenant.

The following observations on the school system and programs in the United States are noted. Many of them may be unnecessary, but they are presented for whatever little they may be worth to an organization already so unusually thorough.

1. It is questionable how much of our own perfected plans for open warfare can be utilized in this present war. While manifestly unsafe to neglect tent pitching, equitation, and drill, it is believed that, if other subjects seemingly requiring more time have to be extended, these branches might be called upon to yield some more room for such extension.

2. The paper routine of the Army, knowledge of regulations, manuals, etc., is an important matter which can best be taught in the United States, but if, as it is hoped, simplification of methods of record can be further secured, as appears to be contemplated especially for the zone of operations, still further time could be secured.

3. The importance of the evacuation hospital can not be overestimated. In this war this hospital has become the pivot on which moves the whole medical service of the front, and it is not an exaggeration to say that save in overwhelming periods of activity, which total perhaps 2 or 3 weeks in every 52, the real determinate surgery is done here; that is to say, the surgery of war has apparently moved, if not entirely, certainly to a large extent, from the base and general hospitals to the evacuation hospital.

It is believed, therefore, that this hospital should receive a longer time for consideration in all training areas.

4. Complementary to this, the use of field hospitals in this war has altered. Their utility is fully as great as ever, especially when one considers that they are the mobile hospitals upon which we have to depend in the critical moment of a change to a war of movement. Meanwhile, they are the utmost necessity for sick and gassed cases.

5. The course on rations and mess management is also apparently rather short. This is such a feature in the British Army that a cookery school is called upon to furnish a considerable amount of instruction at their schools.

6. I strongly recommend the incorporation of Cowell's treatment of shock and his Thomas splint drill. It has saved many lives and limbs here.

The rifle splint drill not included herein provides for continuous extension and is a distinct improvement on all previous improvised methods I have seen. When prepared this will be forwarded.

7. I earnestly recommend the teaching of Lemaître's ideas on the primitive suture to all medical officers. While not yet universally used in the French Army, it is spreading with great rapidity and is the treatment par excellence in the First British Army. In fact, I am informed that the English have adopted it pretty generally in all their armies. I have seen its results, and it is being used at our own American front with astonishingly favorable results. The limitations of its practice should be minutely explained and the Carrel-Dakin method should not be displaced from its legitimate application.

8. The work in trench warfare, construction of dugout, etc., might be increased, as in both French and British Armies medical personnel usually dig their own shelter and consolidate their own positions, usually, of course, under the supervision of the Engineer Corps.

9. As far as I was able to determine, no general instruction on skin diseases is being taught. As fully half (some say 60 to 90 per cent) of the medical cases come from skin diseases, scabies and lice, and trench fever, whose proven vector the louse is, thorough instruction on this subject should be contemplated.

10. The faculty of this school is impressed with the fact that the two absolutely new and the most important contributions to the efficiency of the Army by the Medical Department are (a) the excision of devitalized tissue and surgical sterilization of war wounds of the French and (b) the perfection of convalescent depots by the English. Both are examples of active participation by the Medical Department in helping to win the war. As we were reminded in both allied armies, our humanitarian calling we have always and we shall always practice. This is nothing new but the prevention of disease, and the great reduction in number of days absent from the front of sick and wounded is. This economy of men is vividly brought out

by Lemaitre's statement to me that he had returned 897 out of 1,130 men to the front during a period of six months after an average incapacitation of three weeks by means of his primitive or primitive retarded suture; and that of Colonel Miles, in command of a convalescent depot, who told me that 1,500 men were sent direct to the trenches fit for duty each month. The British medical service charges itself with what they call the "wastage" of the Army in men. Therefore, it would be desirable to give the subject of "convalescent camps" more time in the courses back in the United States. A full description of these camps in the British lines will go forward as soon as completed, giving details. The great point made by all was that they must be operated entirely by medical officers.

11. It is believed that the contention of the British that a high-grade man should be selected to the position of regimental surgeon can not be too seriously considered. Aside from high qualities of morals and knowledge of men, he should be a keen diagnostician, to the end that much useless undoing of dressings and mistakes in the destination of patients who are sent according to the diagnosis tag may be avoided or lessened as much as possible. We were told at some large receiving hospitals that the dressings were never disturbed in the cases of certain regiments because the confidence in the diagnosis was absolute, and a man was sent according to that diagnosis, whereas in other cases diagnosis had to be laboriously remade where time was pressing and could be ill afforded.

PROGRAM FOR THE BASE HOSPITALS

The following were the points most insisted upon and practiced during the nine months' observation that we have had in France.

1. For practical purposes all wounds are considered infected, and distinction is no longer made between bullet wounds and shell wounds unless there is not the slightest doubt that the wound was from a nondeformed bullet at medium range. Practically all such wounds are treated by ample exposure, removal of the missile and of the clothing and other foreign bodies blown into the flesh, together with such devitalized tissue as can be determined in the usual manner.

2. A life-saving procedure is the immediate closure at the very front, before transportation to the evacuation hospital, of the large blowing wounds of the chest. If, as is usually the case, no formal operation can be done, the skin should be pulled together and sutured, and if this is impossible a large dressing, covered with adhesive plaster, should be tightly applied.

3. Cushing's method of intervention in wounds of the brain and peripheral trephining, together with removal of such liquified material from the tract of the wound as can be so removed by a No. 7 rubber catheter, is giving the best results in such cases.

4. The necessity for a physician expert in examination of the chest on all chest teams which may have to be sent to the casualty clearing stations to work seems of importance.

5. The conversation officially of the term "shell shock" which is abused, as well as ignorantly used, by badly shaken soldiers, sets in train conditions which lead up to hysteria and malingering. These cases are termed by the British "Not yet diagnosed" (N. Y. D.) and are sent back to a special hospital, generally a stationary hospital, for observation and treatment, their cases investigated and distinction made between concussion and its effects, and plain hysterical conditions, if possible. We have been advised by several good authorities that it would be justifiable to do a lumbar puncture at the casualty clearing station or first surgical hospital at which these cases are received to determine the presence of blood in the cerebrospinal fluid.

6. Brain cases should not be considered as nontransportable save when in extremis, as such cases travel well before operation and are impossible to move thereafter. The best place for them is in the rear of the evacuation hospital, at some hospital specially designated for the treatment of such injuries.

7. Fracture hospitals should be established in the rear of the evacuation hospital and among the various appliances for treatment, Sinclair's hammock frame for fractures of the pelvis, perineum, and those fractures of the buttocks and hip which prohibit the application of a Thomas splint, is considered to give the best results, both as regards comfort to the patient and facility for treating the wound.

In conclusion I have observed that many of the surgeons accredited to the fighting force in France are lamentably deficient in a correct knowledge of anatomy, and some rapid method, such as the teaching on sectional plates, seems imperative. Many physicians called upon to

do work in the evacuation hospitals, not to speak of those in the rear, while well versed in the special anatomy for formal operations in civil life, have shown themselves lacking in a sufficient knowledge of the relative position of bones, muscles, nerves, veins, and arteries at different levels of the extremities, as well as the functions and distribution of nerves and the insertion and functions of muscles. A relatively little understood anatomical guide is the arterial and nerve supply of muscles. These matters become of first importance in the excision of devitalized tissue which might prevent infection but leave the patient with a functionless limb.

8. The peculiarly close relations which to-day exist between Roentgenology, bacteriology, and surgery is noted, the radiologist being called upon to act always in an adjoining and connecting room to the operating room, frequently in the operating room itself with a localizer, side by side with the surgeon, the surgeon often being obliged to use the fluoroscopic bonnet and the aluminum top table to rapidly judge of the position of projectiles. This mechanical aid to the surgeon has been complemented, especially in the French hospitals, by an expert bacteriologist, who whenever possible cultures the wound before closing and determines the presence or absence of streptococcus, etc.

The great necessity for the training of base hospital medical officers in military administration, not only to the end that they may be able better to conform, and to make their hospital conform, to military life, but because they will be called upon frequently to reinforce units in the advance zone where everything depends on not only professional ability but an unbending spirit of discipline and ability to exact that discipline of others.

This memorandum has been shown to Colonel Stark, chief surgeon of the advance section, lines of communication, of our Army, and the faculty of this school, and they approve of the contents.

BAILEY K. ASHFORD,
Colonel, Medical Corps, United States Army,
Commandant, Army Sanitary School.

Dated March 29, 1918.

PROGRAM OF FIRST SESSION, ARMY SANITARY SCHOOL

(December 3, 1917, to January 5, 1918)

Class reported on December 2, 1917, Army Sanitary School, and left for Paris, December 3, 1917.

Dec. 4:

7 a. m. to 8 p. m.---- Clinic and lecture and demonstrations at fracture hospital, V. R. 76. By Lieut. Col. W. L. Keller, M. C., United States of America.

Dec. 5:

9 a. m.----- Ward dressing demonstration by Carrel-Dakin method. By Doctor Chutro, at Lycee Buffon.

4 p. m.----- Clinical lecture and demonstration of cases. By Professor Babinski, Lycee Buffon.

Dec. 6:

9 a. m.----- Half of the class went to Beaugon Hospital to a lecture by Professor Tuffier on the organization of the French medical service and to see him operate thereafter. The other half to a special operative clinic by Professor Chutro, at the Lycee Buffon.

2 p. m.----- Visit to Val-de-Grace Medical Museum.

Dec. 7:

9 a. m.----- Visit to St. Nicholas Hospital to see ambrine treatment applied and the injection of specially prepared guaicol and oil from the diminution of scar tissue.

Dec. 8:

9 a. m.----- Visit to Major Blake's hospital, No. 6 Piccini.

2 p. m.----- Visit to American ambulance at Neuilly.

December 9: Left for the British front.

December 10: Arrived at casualty clearing station 33, where the school of instruction for the Royal Army Medical Corps of the 1st British Army was in session. The students remained at this center from December 11 to December 23, inclusive, and a separate program for this course is hereby appended.

Program of first class Field Service School for Medical Officers, A. E. F., in the British lines, 1917

Hour	Monday, Dec. 10	Tuesday, Dec. 11	Wednesday, Dec. 12	Thursday, Dec. 13	Friday, Dec. 14
8.30 a. m.		Physical drill	Physical drill	Breakfast	Physical drill
9 a. m.		Breakfast	Breakfast	Visit to the front-line medical units (No. 1, 42d Division; No. 2, 46th Division; No. 3, 46th Division; No. 4, 11th Division; advance dressing station; regimental aid posts. Inspection of dug-outs, trench latrines, etc.	Breakfast
10 a. m.		Opening address	Duties of regimental medical officer		Summary of front-line methods
11 a. m.		Practical splinting, "Thomas drill"	Practical splinting, "Thomas drill"		Conference
12 m.		Lecture, "sick wastage"	Lecture, "Wound shock"		Practical splinting
1 p. m.		Lunch	Lunch		Lunch
2 p. m.	Arrival of class	Demonstration of practical sanitation and lecture	Lecture, "Functions of field ambulances"		Lecture, "Radiology"
3 p. m.			Lecture, "Customs of the service"		Organization of casualty clearing stations
4.30 p. m.		Tea	Tea	Tea	Tea
5 to 8 p. m.	Clinical demonstrations and surgical operations as opportunities arise at Nos. 33 and 1 casualty clearing stations				

Hour	Saturday, Dec. 15	Sunday, Dec. 16	Monday, Dec. 17	Tuesday, Dec. 18
8.30 a. m.	Physical drill	Breakfast	Physical drill	Physical drill
9 a. m.	Breakfast	Church parade	Breakfast	Breakfast
10 a. m.	Visits to casualty clearing stations Nos. 18 and 23. Inspection of No. 23 casualty clearing station	Visit to ordnance	Lecture, "War surgery"	Lecture, "Trench fever"
11 a. m.			Practical splinting	Lecture, "Organization of the medical services"
12 m.			Lecture, "Chest wounds"	Lecture, "Wound shock"
1 p. m.	Lunch	Lunch	Lunch	Lunch
2 p. m.	Nos. 30 and 57 casualty clearing stations		Demonstration of field cookery at First Army School of Cookery	Demonstration, "Vapor baths"
3 p. m.				Lecture, "Medical clerking and records"
4.30 p. m.	Tea	Tea	Tea	Tea
5 to 8 p. m.	Clinical demonstrations and surgical operations as opportunities arise at Nos. 33 and 1, casualty clearing stations	Conference in the C. C. S., D. M. S., consulting surgeon	Clinical demonstrations and surgical operations as opportunities arise at Nos. 33 and 1, casualty clearing stations	

Program of first class Field Service School for Medical Officers, A. E. F., in the British lines, 1917—Continued

Hour	Wednesday, Dec. 19	Thursday, Dec. 20	Friday, Dec. 21	Saturday, Dec. 22	Sunday, Dec. 23
8.30 a. m.	Physical drill	Physical drill	Breakfast	Physical drill	8 a. m. Breakfast
9 a. m.	Breakfast	Breakfast	9.50 a. m.	Breakfast	
10 a. m.	Lecture, "War surgery"	Lecture, "Wound infection and their complications"	Visit to Red Cross depot	9.30 a. m. Lecture, "War surgery"	Ambulance to station; departures
11 a. m.	Lecture, "Obscure medical diseases of the war"	Lecture, "Wound shock"	10.45 a. m. No. 39 stationary hospital	Lecture, "Relation of chaplain's department to medical services"	
12 m.		Lecture, "Convalescent depots, line of communications organization"	Lecture (brief), "Treatment of N. Y. D. N."	Recent Passchendaele experiences	
1 p. m.	Lunch	Lunch	Lunch—molasses	Lunch	
2 p. m.	1.20 p. m. Seventeenth advance depot medical stores, baths, laundry; inspection of field ambulance equipment	Visit to corps rest station and scabies hospital	Surgical wards and infections	Visit to Haudain staff; lecture	
3 p. m.			Merville laboratory	Fallacies of evidence, especially medical	
4.30 p. m.	Party of surgeons to No. 1 casualty clearing station	Tea	Tea	Resume conference	
5 to 8 p. m.	Clinical demonstrations and surgical operations as opportunities arise at Nos. 33 and 1 casualty clearing stations				

December 23 to 25: En route to the Army Sanitary School.

PROGRAM AT THE ARMY SANITARY SCHOOL, FIRST SESSION

December 25: Arrived at the Army Sanitary School from the British front.

During the period of eight days remaining, from December 26, 1917, to January 5, 1918, inclusive, a period of three complete days was devoted to practical gas instruction, and in the remaining seven days each student was required to write a complete account of his course from notes taken on the tour of instructions just completed. In addition to this, the following lectures were delivered.

Three hours, by Professor Lemaitre, who came on from the Fifth Army Sanitary School at the request of the commandant to give a lecture on the "Primitive suture of war wounds."

One hour on the effects of new ordnance, by an officer of the Ordinance Corps.

Two hours on diverse subjects, by Colonel Ashford.

Three hours, by Medecin-Aide-Major Aime, of the French Army, on various phases of war surgery.

PROGRAM OF INSTRUCTION FOR THE SECOND SESSION, ARMY SANITARY SCHOOL

Class reported January 9, 1918, at Army Sanitary School, Left for Paris, January 10. Began course, January 11, 7 a.m.

At the V. R. 76 fracture hospital by Lieut. Col. W. L. Keller, M. C., instructor in military surgery, demonstrator, and lecturer.

Jan. 11:

- | | |
|--------------------------|--|
| 8.30 to 10.30 a. m.----- | Ward instruction in the treatment of fractures with the different types of splints recommended for use in the United States Army. |
| 11 to 12 m.----- | War wounds; wound bacteriology; primary suture—retarded primary suture and secondary suture; traumatic shock. |
| 1 to 2 p. m.----- | Fractures, treatment, and prognosis. Extracts from Doctor DePage's paper on fractures of the femur. Conclusions on fractures of the femur. Interallied Congress. |
| 2 to 3 p. m.----- | The use of Dakin's solution, dichloramine-T., and eusol in the treatment of suppurating wounds. Flavine chemical composition and germicidal properties. |
| 3 to 4 p. m.----- | Diagnosis in chest conditions. Extracts from papers by Duval, Tuffier. |
| 4 to 5 p. m.----- | Radiology. |

Jan. 12:

- | | |
|---------------------------|---|
| 8.30 to 9.30 a. m.----- | Ward dressings (staff). |
| 9.30 to 10.30 a. m.----- | Chest and abdomen. |
| 10.30 to 11.30 a. m.----- | The new German asphyxiating gas. |
| 11 to 12 m.----- | Care of joints, muscles, tendons, and tendon sheaths during treatment of fractures. |
| 1 to 2 p. m.----- | Extracts from paper by Professor Wilhelm on the treatment of joint injuries. Conclusions of Interallied Congress. |
| 2 to 3 p. m.----- | Surgery of the head and spine; conclusions; review of two days' work. |
| 3 to 4 p. m.----- | Gas gangrene; tetanus. |
| 4 to 5 p. m.----- | Radiology. |

January 13: En route to the school of instruction for medical officers, Fifth French Army.

On our arrival we were given the following general instructions: The class at this school for this course consisted of 50 medical officers—28 American and 22 French. These were divided into two American groups and two French groups. Instruction was all in French, and after dinner each night the commandant and two other officers, being the only ones who understood the language, rehearsed the substance of the lectures during the day.

Thus the instruction consisted of all the day and the evening up until 11 o'clock at night; and officers were frequently called in groups to witness operations until 2 a. m. The clinical work in wards and operating room in the daytime between lectures, as well as laboratory demonstrations, completely filled every hour of the day save those set aside for meals. Conferences of the French averaged at least two hours in length. These demonstrations were provided for as follows:

SCHEDULE FOR THE DOCTORS VISITING THIS HOSPITAL TO WITNESS THE VARIOUS PRACTICAL DEMONSTRATIONS

In order to avoid overcrowding, which would be produced necessarily if all the doctors should present themselves at the same time at the same service, it is recommended that they group themselves in the following order:

First, visits to the surgical services.—Operating group No. 10, service of M. M. Leriche (fractures) and Roux-Berger (visceral wounds). From the 14th to 19th inclusive, American doctors; from the 21st to 26th, inclusive, French doctors. Operating group No. 15, service of M. Lemaître (wounds of soft parts). From the 14th to 19th, inclusive, French doctors; from the 21st to 26th, inclusive, American doctors.

Visits and demonstrations of wounded will take place each day from half past 10 till 12 in the morning.

Second, practical demonstrations.—These will begin January 16 and will be held at 3.30 in the afternoon.

For the purpose of the above, doctors will divide into four groups—two groups American and two French.

	Service of trench foot	Pathologic histology	Bacteriology	Radiology
Jan. 16.....	First group.....		Third group.....	
Jan. 17.....		Fourth group.....		
Jan. 18.....	Second group.....		Fourth group.....	
Jan. 19.....		First group.....		Second group.
Jan. 21.....	Third group.....		First group.....	Fourth group.
Jan. 22.....		Second group.....		Third group.
Jan. 23.....	Fourth group.....		Second group.....	
Jan. 24.....		Third group.....		First group.

GENERAL INSTRUCTIONS

1. The conferences, according to the program appended, will take place at 9 o'clock in the morning and 2 o'clock in the afternoon, in barrack No. 64.

2. Special exercises or demonstrations in surgical, medical, and laboratory centers will be announced, as the occasion may arise, in the assembly hall in the officers' mess.

3. Meals will be served in the various messes at half past 8 in the morning, midday, and 7 p. m.

4. Visiting officers have at their disposal: (a) The shower baths situated near the mess; (b) the scientific and literary library of the officers' mess; (c) the post exchange of the hospital and of the officers in the village of ———.

5. There is a post office in the hospital near the laboratory barrack. Letters should be posted in the evenings before half past 7 in order to leave the next morning. The military address of the hospital is: Ambulance 12/1, Scientific Group, Postal Sector 1224.

Service de Sante Militaire

CONFERENCES ON WAR SURGERY WHICH WILL BE GIVEN IN THE RESEARCH AND INSTRUCTION CENTER OF ——— FROM THE 14TH TO THE 27TH OF JANUARY, 1918

January 14 (9 a. m.): General consideration on wounds of war. By the consulting surgeon to the Army.

January 14 (2 p. m.): Pathology and physiology and anatomy, common to wounds; spontaneous evolution; process of cicatrization. By the associate professor in the faculty of medicine of Lyons, chief of a laboratory group.

January 15 (9 a. m.): Bacteriology of wounds, microbes and the habits of aerobes; supuration. By a medical officer of the Pasteur Institute.

January 15 (2 p. m.): Bacteriology of wounds, microbes and the habits of anaerobes.

January 16 (9 a. m.): Antitetanic serotherapy. By the associate professor of the faculty of medicine, surgeon of Paris Hospital, consulting surgeon of the Army.

January 16 (2 p. m.): Gas gangrene, clinical forms, and treatment. By the chief of a surgical group.

January 17 (9 a. m.): Treatment of wounds of the soft parts in general by primitive suture; indications, contraindications, and technique. By the chief of a surgical group.

January 17 (2 p. m.): Disinfection and secondary suture of wounds; indications and various methods of technique.

January 18 (9 a. m.): Abdominal wounds in general. By the associate professor of faculty of medicine of Paris; consulting surgeon of an Army corps.

January 18 (2 p. m.): Frost bite of the feet, and trench foot. By the associate professor of Val-de-Grace, medical chief of an evacuation hospital.

January 19 (9 a. m.): Shell shock. By the associate professor of faculty of medicine, physician to the Hospital of Paris, chief of a medical group.

January 19 (2 p. m.): Fresh wounds of articulations. By the associate professor of the faculty of medicine of Lyons, chief of a surgical group.

January 20 (9 a. m.): The wounds of the brain.

January 20 (2 p. m.): General discussion by surgeons—regimental, ambulance, evacuation hospital, base hospital, and biologists—on traumatic shock. Presided over by Charles Richet, member of the Academie Francaise; originator of the theory of anaphylaxis.

January 21 (9 a. m.): Complications, secondary and late, of wounds of the cranium and brain.

January 21 (2 p. m.): Spirochetal jaundice.

January 22 (9 a. m.): Wounds of nerves.

January 22 (2 p. m.): The open fractures of the diaphysis; principles of their early operative treatment.

January 23 (9 a. m.): The open fractures of the diaphysis; principles of their orthopedic treatment.

January 23 (2 p. m.): The wounds of the pleura and the lungs. By a surgeon of the Paris hospitals, chief of a surgical group.

January 24 (9 a. m.): Indications and general technique of amputations due to fresh wounds of war. By the chief of auto-chir.

January 24 (2 p. m.): The technique of radiologic assistants to the surgeon in the surgical units of the advance; the demonstration of apparatus and methods. By the associate professor of the faculty of medicine of Lyons, chief of the base laboratory of radiology.

January 25 (9 a. m.): The wounds of the eyes. By an ophthalmologist of the Paris hospitals, chief of the ophthalmological center of a surgical group.

January 25 (2 p. m.): Lecture by an officer of the General Staff of the French Army on the tactical disposition of medical units of the advance and lines of communications.

January 26 (9 a. m.): Wounds of the blood vessels.

January 26 (2 p. m.): Organization and administration of first-aid units and divisional ambulance companies. By an associate professor of the faculty of medicine of Nancy, chief of a divisional ambulance.

January 27 (9 a. m.): Gas in war; general review; treatment of intoxication produced by asphyxiating gases. By the chief of medical legal center for the Army.

January 27 (2 p. m.): Visit to Rheims and regimental and field ambulance stations therein.

January 28 (9 a. m.): Visit to the trenches by the two groups of American medical officers.

January 29: Visit to the trenches of the other two remaining groups of American medical officers.

January 30: En route to Paris. On the way, visit to hospitals and a medical legal center for the French Army.

January 31 (9 a. m.): Operative clinic; removal of projectiles from healed chests on the X-ray operating table at Hospital 16, Rue Leroux.

January 31 (4 p. m.): Plastic surgery.

(1) Conference, with the following subprogram, on the mutilation of the palate and vestibulo-palatine region of war wounds.

(2) Operative clinic:

(a) Restoration of lower lip by autoplasty.

(b) Reparation of a loss of substance from the cranium by cartilaginous transplanting.

(c) Reconstruction of the cheek bones by cartilaginous graft.

(d) Restoration of the lower eyelid.

(e) Rhinoplasty.

(f) Various plastic operations.

February 1 (9.30 a. m.): Demonstration of wound dressing by the Carrel-Dakin method.

February 1 (4 p. m.): Nerve lesions incident to war wounds.

February 2 (8.30 a. m.): Special operative clinic. At the Lycee Buffon.

February 2 (2 p. m.): Inspection of the Val-de-Grace Medical Museum.

February 3: En route from Paris to the Army Sanitary School.

PROGRAM AT THE ARMY SANITARY SCHOOL

(NOTE.—The total number of hours concerned in instruction each day was from 5 to 6 hours; but the officers completed a full 9 hours each day by writing up their notes on the visit to the front.)

- Feb. 4:
 9.30 to 11.30 a. m.----- Field messages.
 3.10 to 4.30 p. m.----- Tactical problems (staff college).
- Feb. 5:
 9.30 to 11 a. m.----- Personal hygiene.
 1.15 to 4.30 p. m.----- Gas instruction (at Army Sanitary School).
- Feb. 6:
 8.30 to 10 a. m.----- Obturators for the ears of artillerymen. By a medecin-aide-major of French Artillery regiment.
 10 to 11.30 a. m.----- Wounds of soft parts. By a medecin-major of a French surgical hospital.
 1.15 to 4.30 p. m.----- Gas instruction.
- Feb. 7:
 8.30 to 10 a. m.----- Obturators for the ears of artillerymen.
 10 to 11.30 a. m.----- Lesions of bones and articulation in war. By a medecin-major of a French surgical hospital.
 1.15 to 4.30 p. m.----- Gas instruction.
- Feb. 8:
 10 to 10.50 a. m.----- Fractures in war.
 10.50 a. m. to 12 m.----- Casualty clearing stations.
 1 to 3.30 p. m.----- Map reading (engineer school).
- Feb. 9:
 9 to 10.30 a. m.----- War game (at staff college).
 10.30 to 12 a. m.----- Casualty clearing stations.
 2 to 3 p. m.----- The Medical Department in the trenches.
- Feb. 11:
 9.30 to 10.30 a. m.----- Comparison of medical services.
 10.30 to 11.30 a. m.----- British medical service.
 1 to 3 p. m.----- Field sketching.
- Feb. 12:
 9.30 to 10.30 a. m.----- Regimental surgeon in trench warfare.
 10.30 to 11.30 a. m.----- Line of communications.
 2 to 3 p. m.----- Field hospitals.
 3 to 4 p. m.----- Report of a visit to scabies hospital, corps rest station, motor ambulance convoy, stationary ambulance 29, and General Hospital 70, in the British lines.
- Feb. 13:
 9.30 to 10.30 a. m.----- Line of communications.
 10.50 to 12 a. m.----- Genitourinary surgery and venereal diseases.
 2 to 3 p. m.----- Comparisons of medical services.
 3 to 4 p. m.----- Some medical aspects of the Battle of Cambrai. By an officer who took part in this battle.
- Feb. 14:
 9.30 to 10.30 a. m.----- Ambulance companies.
 10.50 to 12 a. m.----- Genitourinary surgery and venereal diseases.
 2 to 3 p. m.----- Casualty clearing stations and evacuation hospitals.
 3 to 4 p. m.----- Battle of Cambrai.
- Feb. 15:
 9.30 to 10.30 a. m.----- Oral hygiene.
 10.30 to 12 a. m.----- Genitourinary surgery and venereal diseases.
 2 to 3 p. m.----- Pneumonia. By commander of officers' hospital for the Army school area.
 3 to 4 p. m.----- Comparison of medical services.

Feb. 16:

10 a. m.----- Shock.
 1.30 p. m.----- Dugouts. By officer of Engineer Corps.

Feb. 18:

9 to 10.20 a. m.----- Map reading, conference.
 10.30 to 11.30 a. m.----- Hygiene in trenches and rest areas.
 1.30 to 4.30 p. m.----- Map reading, problem.

Feb. 19:

9 to 10.20 a. m.----- Map reading, conference.
 10.30 to 11.30 a. m.----- Standard sanitary devices.
 1.30 to 4.30 p. m.----- Map reading, problem.

Feb. 20:

9 to 10.20 a. m.----- Map reading, conference.
 10.30 to 12 a. m.----- Map reading, problem.
 2 to 4 p. m.----- Demonstrations of French system of physical exercises.

Feb. 21:

9 to 10 a. m.----- Operative treatment of wound shock.
 10.30 to 11.30 a. m.----- Shock.
 1.30 to 4.30 p. m.----- Map reading, problem.

Feb. 22:

Trench fever. Return of class to their stations.

PROGRAM OF THIRD CLASS OF THE ARMY SANITARY SCHOOL

February 25 to March 3, 1918

[First hour, 9 to 10.30 a. m.; second hour, 10.30 to 12 a. m.; third hour, 1.30 to 3 p. m.; fourth hour, 3 to 4.30 p. m.]

FIRST PERIOD

Day	Date	Hour	Subject	Day	Date	Hour	Subject
1	Feb. 25	1	Address by the commandant.	4	Feb. 28	3	Trench sanitation.
		2	Comparison of medical services.			4	Veneral diseases.
		3, 4	Gas instruction.	5	Mar. 1	1	Water supply.
2	Feb. 26	1	Personal hygiene.			2	Food supply, preservation and preparation.
		2	Comparison of medical services.			3	Laundries and baths.
		3, 4	Gas instruction.			4	Diseases of war.
3	Feb. 27	1	Fighting formations.	6	Mar. 2	1	Field lines of information.
		2	Comparison of medical services.			2	Standard sanitary devices.
		3, 4	Gas instruction.			3	Wound shock.
4	Feb. 28	1	Battle of Cambrai.			4	War surgery.
		2	Trenches, dugouts, etc.				

PROGRAM OF THIRD SESSION OF THE ARMY SANITARY SCHOOL

March 4 to 28

TRIP TO BRITISH FRONT

The class left as per the attached order for the school of instruction of the Royal Army Medical Corps, of the First Army, March 4, arriving March 6, 1918.

One of the class, Major Poole, was called to the American front on an operating team the 3d of March and did not accompany the class.

The English had arranged for instructions to be given conjointly with a British class of some 20 medical officers.

The course of this school concluded March 16, and the class left for a course at the base, 13 officers going to one of the largest base ports in the English Army and 14 going to a similar base port elsewhere. The course of these two groups was similar, but the instruction in Group 1 was more extensive. These programs are separately attached under headings program, Group 1, and Group 2, at base.

These groups left their respective base ports on the 21st of March and were again consolidated into a single class to spend five days in the hospitals of Paris, arriving there on the 21st.

FIRST ARMY, R. A. M. C., SCHOOL OF INSTRUCTION

Second American medical officers' course—third class, Army Sanitary School, March 3 to 16, 1918

Time	Wednesday, Mar. 6	Thursday, Mar. 7	Friday, Mar. 8	Saturday, Mar. 9	Sunday, Mar. 10	Monday, Mar. 11
8.30 a. m.		Physical drill	Physical drill	Breakfast		Physical drill
9 a. m.		Breakfast	Breakfast		Breakfast	Breakfast
10 a. m.	Class arrived	Opening address, D. M. S., First Army. General lecture: "Surgery"	Lecture: "Gas poisoning"	Visit to front line in 5 groups		Lecture: "Flies in relation to disease"
11 a. m.		Lecture: "W nephritis"	Visit to sanitary school and demonstration of sanitary appliances	M. D. S.	10.45 a. m. Church parade; assistant chaplain, First French Army	Lecture: "Wound shock"
12 noon		Demonstration: Thomas splint	Lecture: "Obscure diseases of the war"	A. D. S.	Discussion on the duties of a division surgeon	Lecture: "Care of transport (animals and wagons)," director of British school
1 p. m.	Lunch	Lunch	Lunch	Lunch	Lunch	Lunch
2 p. m.	Visit to No. 6 casualty clearing station	Visit to scabies station and corps rest station	1.30 p. m. Lecture: "Field sanitation"	R. A. P.		1.30 p. m. Visit to No. 12 stationary hospital and demonstration of results of research and the transmissibility of trench fever by the louse
3 p. m.		Inspection of field ambulance equipment	Lecture: "Surgery of the war and casualty clearing station"	Inspection of dugouts, anti-gas protection, trench, latrines, etc.		
4.30 p. m.	Tea	Tea	Tea	Tea	Tea	Tea
5 p. m.	Talk: Customs of the service. By the commandant	Field ambulances, by the director, British school	Discussion: War surgery	Discussion on trench conditions as per visit	Conference: front-line work	Lecture: "Work at a casualty clearing station"
8 p. m.	Officers' mess	Officers' mess	Officers' mess	Officers' mess	Officers' mess	Officers' mess

*Second American medical officers' course—third class, Army Sanitary School, March 3 to 16
1918—Continued*

Time	Tuesday, Mar. 12	Wednesday, Mar. 13	Thursday, Mar. 14	Friday, Mar. 15	Saturday, Mar. 16
8.30 a. m.	Physical drill	Physical drill	Physical drill	Physical drill	
9.00 a. m.	Breakfast	Breakfast	Breakfast	Breakfast	Breakfast
10 a. m.	Lecture: "Pathology of medical diseases"	10 to 10.30 a. m. Address and practical demonstration given to 100 enlisted of the R. A. M. C., with demonstration of first aid. D. M. S., First Army	Lecture: "Gas gangrene and wound infection"	Lecture: "Duties of regimental medical officers D. M. S., First Army"	Departure after inspection by D. M. S., First Army
11 a. m.	Practical demonstration: Triangular bandage and the use of the rifle splint	10.30 to 11.30 a. m. Lecture: "Evacuation of casualties from front line." By the commanding officer of a litter group, field ambulance	Booking for sick and wounded		
12 noon	Lecture: "Trench fever"	11.30 to 12 noon Practical demonstrations: "Rechauffement." Lecture: "Dug-outs"	Lecture: "Skin diseases"	Lecture: "Gunshot wounds of chest"	
1 p. m.	Lunch	Lunch	Lunch	Lunch	
2 p. m.	Visit to Nos. 1 and 23 casualty cleaning stations	Visit and demonstration School of Cookery	Visit to Nos. 30 and 57, casualty cleaning stations	Résumé. Lecture	
4.30 p. m.	Tea	Tea	Tea	Tea	
5 p. m.	Discussion: Medical officers British Army on wound shock		Conference: Casualty cleaning station methods		
8 p. m.	Officers' mess	Officers' mess	Officers' mess	Officers mess: farewell dinner to General Thompson, his staff, and British medical officers	

PROGRAM AT A BASE PORT, BRITISH ARMY

Group 2, under the command of Lieutenant Colonel Porter

March 16:

Arrived at Etaples; met by representative of C. C. M. S. and taken to a British Expeditionary Force canteen club, where the class was installed in cubicles adjoining the officers' club and dining room.

March 17:

10 a. m. Reported to Colonel Bearford, C. C. M. S. and met Captain Childs, special sanitary officer.

2 p. m. Visit to large camp laundry and ablution huts, and reinforcement Camp E.

March 18:

a. m. Visit to fat reclamation establishment, sanitary section camp and workshops.

p. m. Visit to kitchens of reinforcement camps and latrines of same.

March 19:

a. m. Visit to W. A. A. C. camps. Visit to St. Johns Ambulance Brigade Hospital.

p. m. Visit to No. 51, General Hospital (venereal), and No. 15, General Hospital.

March 20:

- a. m. Visit to observation surgical wards (experimental). Visit to Canadian General Hospital No. 1, femur wards.
p. m. Visit to hospital ambulance ships, Bologne; convalescent camp.

March 21:

Return to Paris.

March 22:

- 9 a. m. At the Hospital Beaujon; lecture on "Surgery of the Chest," followed by operative clinic, and demonstration of the organization of the French Medical Service in War.
2 p. m. Visit to the Val-de-Grace Museum.

March 23:

- 7 a. m. to 6 p. m. Visit fracture hospital, French Army, V. R. 76.
(a) Bedside clinic and demonstration of cases and appliances.
(b) Lecture on war surgery, and organization of the Medical Service of the French Army.
(c) The débridement of war wounds.
(d) Transfusion of blood.
(e) Wilhelm's treatment of joint injuries.
(f) Lecture and demonstration of apparatus and a lantern exposition, by a radiologist of the hospital.

March 24:

Visit and demonstration of cases at St. Nicolas Hospital for the burned; ambrine treatment and the injection of refined guaiacol with oil for the diminution of scar tissue.

March 25:

- 9 a. m. Demonstration of dressing by Carrel-Dakin method in the Hospital Lycée Buffon.
4 p. m. Clinic lecture with demonstration of cases and methods of diagnosis at Professor Babinski's Clinic at Lycée Buffon, subject: "The diagnosis of obscure nerves of the diseases and injuries of the nervous system in war."

March 26:

- 8 a. m. Special operative clinic on war surgery at the Lycée Buffon; p. m., visits to the various hospitals in Paris.

March 27:

- 8.15 a. m. Lecture by Professor Morestin, military hospital at Val-de-Grace on cranio-plasty in wounds of war; followed by operative clinic at which the following operations were performed:
(1) Rhinoplasty.
(2) Cancer of the tongue with a complete removal of glands surrounding vessels of the neck, the external dissection of the tonsils and part of the palatine arch, by Professor Morestin.

March 28:

En route from Paris to the Army Sanitary School.

Day	Date	Hour		Day	Date	Hour	
SECOND PERIOD				THIRD PERIOD—continued			
7	Mar. 4	-----	Leave for front.	35	Apr. 2	2	Duties of division and corps surgeons.
8	Mar. 5	-----	Arrive at front.			3	Field messages.
26	Mar. 23	-----	Arrive at Paris.			4	Venereal diseases.
31	Mar. 28	-----	Arrive at Langres.	36	Apr. 3	1	Lines of communications.
THIRD PERIOD						2	War neuroses.
32	Mar. 29	1	Regimental surgeon in trench warfare.			3	Battle casualties and evacuation.
		2	Equipment of Medical Department soldier.	37	Apr. 4	4	Battle of Cambrai.
		3	Lines of communications.			1, 2	Map reading conference.
		4	Classification and disposal of casualties.	38	Apr. 5	3, 4	Map problem.
33	Mar. 30	1	The ambulance company.	39	Apr. 6	1, 2	Map reading conference.
		2	Evacuation hospitals.			3, 4	Map problem.
		3	Pneumonia.	40	Apr. 8	1, 2	War surgery.
34	Apr. 1	1	Trench fever and icterus.			3, 4	Field work with ambulance company.
		2	Oral hygiene.	41	Apr. 9	1, 2	War surgery.
		3	Field hospitals.			3, 4	Ambulance company training and demonstration.
35	Apr. 2	1	Scabies hospital, motor ambulance convoys, stationary hospital, Red Cross depots.	42	Apr. 10	-----	Return to proper stations.

As noted in the following communication, beginning with the fourth course the policy of the school was changed with respect to the length of the course and the number of students attending. These changes were in line with the following communication from general headquarters, A. E. F., to the commandant, Army schools:⁸

GENERAL HEADQUARTERS,
AMERICAN EXPEDITIONARY FORCES,
France, March 4, 1918.

From: The Adjutant General.

To: The commandant, Army schools.

Subject: Army Sanitary School.

1. In order to secure economy, efficiency, and systematized training of officers of the Medical Department, it is desired to consolidate all school instruction of medical officers at the Army Sanitary School; and for the purpose of securing a greater flow of students through this school, to increase the classes to at least 50 medical officers and to shorten the length of the period of general instruction to one month at the Army Sanitary School. But it is still desired to send 25 students of each class who have shown the greatest aptitude in their work to some sector of the allied front on a visit of instruction of two weeks duration where they may receive special training in order to render them available for duty as instructors in the corps and division.

2. Instruction of medical officers as outlined should begin with the fourth class, which will be ordered to report to the Army school about April 7, 1918, and should follow as closely as practicable the inclosed schedule, particular attention being given to instruction by map problems and terrain exercises. It is desired that such arrangements as may be necessary be made for future classes upon this basis.

3. In view of the necessity for instruction of dental officers in order to prepare them for duty with troops; the inadvisability of establishing a new dental school in Paris and elsewhere; and the economy in teaching force, equipment, and housing of the dental school, established as it now is as a section of the Army Sanitary School, it is deemed best that it continue at Langres.

By command of General PERSHING:

F. R. KINNEY, *Adjutant General.*

PROGRAM OF INSTRUCTION, ARMY SANITARY SCHOOL—ONE MONTH

1. Administration:	Hours
General orders and circulars, American Expeditionary Forces; bulletins and circulars, chief surgeon, A. E. F.; field records of sick and wounded; property and individual accounts.....	4
2. Military sanitation:	
Personal hygiene, venereal prophylaxis, care of feet.....	2
General hygiene—march, camp, trench, combat, disposal of the dead.....	4
Water—supply, examination, treatment.....	1
Food—supply, preservation, preparation.....	1
Clothing—supply, cleansing.....	1
Laundries—devices, methods.....	1
Bathing—devices, methods, delousing, insecticides.....	2
Shelter—selection, improvisation, construction of huts, barracks, billets, and their sanitary inspection.....	1
Disposal of wastes—human, animal, kitchen, and camp garbage.....	2
Standard sanitary devices—demonstration and description of use.....	2
3. Military surgery:	
Sepsis, antisepsis, shock—special wounds, special methods of treatment.....	10
4. Military medicine:	
Psychology, psychiatry, malingering, special diseases, including treatment of gas poisoning.....	10

	Hours
5. General instruction:	
Organization of the expeditionary forces.....	1
Disposition of combatant and auxiliary troops—march, attack, defense, retirement, trench.....	4
Field orders.....	1
Field sketching.....	16
Artillery and infantry weapons—effects.....	1
Fire cover—use and construction, trenches, dugouts, bombproofs, drainage, and ventilation.....	4
Field transportation—use and care of animals, their equipment, wagons, and motors.....	8
Gas defense—agents used, wind, alarms, methods, and devices for protection and removal; gas drill.....	18
6. Military tactics:	
Sanitary units—equipment and functions.....	4
Casualties—classification and disposal.....	2
Field duties—of unit commanders, directors, surgeons.....	2
Problems—map and terrain exercises, battalion, regiment, brigade, division in attack, defense, retirement.....	54

7. Visit of instruction: At the close of each course 25 officers of each class showing the greatest aptitude will be conducted on a visit of instruction of two weeks' duration to some sector of the allied front where they will be given special opportunities for observation and training.

The instruction will consist of demonstrations and problems for the purpose of training officers in handling sanitary units and the evacuation of casualties of field service. Instruction in hygiene, sanitation, administration, and medicine and surgery will be limited to preparation for the mastery of problems presented by service conditions to be encountered by the expeditionary forces. The time to be given to the various subjects as laid down in program is merely advisory, except in regard to sanitary tactics to which full time will be given.

After the fourth session of the school the tours for instruction were made principally to the American sector and written reports were not made by the officers conducting these tours.

PROGRAM, ARMY SANITARY SCHOOL

FIFTH SESSION (OFFICERS)

Daily, except Sundays and holidays, 6.15 to 7 a. m., drill and setting-up exercises.

First period, 9 to 10.30 a. m.; second period, 10.30 a. m. to 12 m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Sunday, May 26:

9 a. m. Opening address.

Monday, May 27 (first day):

1. Map reading.
2. Field sketching.
3. Histopathology and bacteriology of war wounds.
4. Bathing, delousing, and laundrying.

Tuesday, May 28 (second day):

1. Field orders.
2. Application and demonstration of Thomas and other splints.
3. { Dugouts and their camouflage.
4. {

Wednesday, May 29 (third day):

1. The Army kitchen.
2. Primary, primary delayed, and secondary sutures.
3. Regimental and battalion aid stations in this war.
4. The ambulance company and its dressing station and the field hospital.

Friday, May 31 (fourth day):

1. The evacuation hospital.
2. Principles of war surgery.
3. Malingering.
4. War-wound infection and abdominal injuries.

Saturday, June 1 (fifth day):

1. Obscure medical diseases of war.
2. Shock.
3. Skin diseases and scabies.
4. Venereal diseases.

Monday, June 3 (sixth day):

1. Disorderly action of the heart.
2. Principles and early treatment of bone and joint injuries.
3. Organization and general activities of the section of orthopedic surgery.
4. Convalescent camps.

Tuesday, June 4 (seventh day):

1. }
2. } Visit to central laboratory.
3. }
4. }

Wednesday, June 5 (eighth day):

1. }
2. } Visit to evacuation hospital.
3. }
4. }

Thursday, June 6 (ninth day):

1. }
2. } Gas instruction (beginning at 8.30
3. } a. m.).
4. }

Friday, June 7 (tenth day):

1. }
2. } Visit to medical-supply depot.
3. }
4. }

Saturday, June 8 (eleventh day):

1. }
2. } Gas instruction (beginning at 8.30
3. } a. m.).
4. }

Monday, June 10 (twelfth day):

1. } Visit to front.
2. }
3. } Lecture by Major Allison at Evacuation Hospital No. 2: "Orthopedic work in the tactical division."
4. }

Tuesday, June 11 (thirteenth day):

1. }
2. } Visit to front.
3. }
4. }

Wednesday, June 12 (fourteenth day):

1. }
2. } Visit to front.
3. }
4. }

Thursday, June 13 (fifteenth day):

1. }
2. } Map and terrain exercise.
3. }
4. }

Friday, June 14 (sixteenth day):

1. Sanitation in this war, including disposal of wastes on the march, in camp, and in combat.
2. War nephritis.
3. Physiological treatment of gassed cases.
4. Function of the physician in the American Expeditionary Forces.

Saturday, June 15 (seventeenth day):

1. Personal and general hygiene.
2. Oral hygiene.
3. }
4. } Field sketching exercises.

Monday, June 17 (eighteenth day):

1. }
2. } Cars: use and repair of motor vehicles
3. }
4. } Field sketching exercises.

Tuesday, June 18 (nineteenth day):

1. Trench fever.
2. Wounds of the soft parts.
3. Symptoms and treatment of war neuroses and shell shock.
4. The mental side of military delinquency.

Wednesday, June 19 (twentieth day):

1. Disposition of combatant and auxiliary troops on the march and in intrenched positions.
2. The effects of new ordnance in this war.
3. War neuroses.
4. Austrian and German medical services.

Thursday, June 20 (twenty-first day):

1. Austrian and German medical services.
2. Neurological problems in a general hospital.
3. Maxillofacial injuries (1 to 2 p. m.).
4. Ophthalmology (2 to 3 p. m.).
5. Surgery of the ear, nose, and throat (3 to 4 p. m.).

Friday, June 21 (twenty-second day), to Monday, June 24 (twenty-fourth day), inclusive:

Trip to the front.

Tuesday, June 25 (twenty-fifth day):

1. Tetanus and gas gangrene.
2. Bone and joint injuries.
3. Shock.
4. War neuroses.

8 p. m., surgery of the nervous system.

Wednesday, June 26 (twenty-sixth day):

1. } Food, its conservation, inspection and
2. } the handling of the ration; exhibition
3. } of kitchens and other appliances in
4. } the school area.
3. Examination of water, and its treatment.
4. The duties of a division and corps surgeon.

CANDIDATES FOR COMMISSION IN MEDICAL RESERVE CORPS ^b

Daily, 6.15 to 7 a. m., drill and setting-up exercises.

First period, 9 to 10.30 a. m.; second period, 10.30 a. m. to 12 m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Tuesday, May 21 (first day):

1. }
2. }
3. } Gas instruction.
4. }

Wednesday, May 22 (second day):

1. }
2. }
3. } Gas instruction.
4. }

Thursday, May 23 (third day):

1. Battalion aid stations and duties of regimental medical officers.
2. The ambulance company and its stations.
3. The field hospital in this war.
4. The evacuation hospital.

Friday, May 24 (fourth day):

1. Map reading.
2. Field sketching, lecture.
3. Field orders.
4. Sanitation in this war.

Saturday, May 25 (fifth day):

1. Map and terrain exercises.
2. Sanitation in this war.
3. }
4. } Map and terrain exercises.

Monday May 27 (sixth day):

1. } Medical Department organization,
2. } records, and office work.
3. Histopathology and bacteriology of war wounds.
4. Bathing, delousing, and laundering.

Tuesday, May 28 (seventh day):

1. } Medical Department organization,
2. } records and office work.
3. } Demonstration of dugouts, trenches,
4. } bombproofs, and their camouflage.

Wednesday, May 29 (eighth day):

1. The Army kitchen.
2. Primary, primary delayed, and secondary suture.
3. }
4. } Practical field sketching.

Thursday, May 30 (ninth day):

Memorial Day.

Friday, May 31 (tenth day):

1. } Medical Department organization,
2. } records, and office work.
3. Malingering.
4. War-wound infection and abdominal injuries.

Saturday, June 1 (eleventh day):

1. Obscure medical diseases of war (a review).
2. Shock.
3. Skin diseases and scabies in this war.
4. Venereal diseases.

Monday, June 3 (twelfth day):

1. Disorderly action of the heart (D. A. H.).
2. Principles and early treatment of bone and joint injuries.
3. Notes on stationary, general, and base hospitals, scabies hospitals, rest stations, and other Medical Department organizations of the allied armies.
4. Convalescent camps.

Tuesday, June 4 (thirteenth day):

1. }
2. } Visit to central laboratory (canceled
3. } for lack of transportation).
4. }

Wednesday, June 5 (fourteenth day):

1. }
2. } Visit to Evacuation Hospital No. 1
3. } (canceled for lack of transportation).
4. }

Thursday, June 6 (fifteenth day):

1. }
2. }
3. } Map and terrain exercises.
4. }

Friday, June 7 (sixteenth day):

1. }
2. } Visit to a medical-supply depot (canceled for lack of transportation).
3. }
4. }

^b This class was composed of 30 medical students ordered to the school from Base Hospital No. 18 in compliance with S. O. No. 137, G. H. Q. A. E. F., France, May 17, 1918.

SIXTH SESSION (SECTION I)

Daily, except Sundays and holidays 6.45 to 7.15 a. m., setting-up exercises.

First period, 9 to 10.30 a. m.; second period, 10.30 to 12 a. m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Tuesday, July 2:

1. Opening address.
2. Map reading.
3. Histopathology and bacteriology of war wounds.
4. Bathing, delousing, and laundering.

Wednesday, July 3:

1. Field orders.
2. Application and demonstration of Thomas and other splints.
3. } Dugouts and their camouflage.
4. }

Friday, July 5:

1. }
2. } Gas instruction (beginning at 8.30 a. m.).
3. }
4. }

Saturday, July 6:

1. }
2. } Gas instruction (beginning at 8.30 a. m.).
3. }
4. }

Monday, July 8:

1. The Army kitchen.
2. Primary, primary delayed, and secondary suture.
3. Regimental and battalion aid stations in this war.
4. The ambulance company and its dressing station, and the field hospital.

Tuesday, July 9:

1. } Food; its conservation, inspection; and the handling of the ration.
2. } Exhibition of kitchens and other appliances in the school area.
3. The duties of a division and corps surgeon.
4. The evacuation of the wounded in the 1st Division.

Wednesday, July 10:

1. }
2. } Visit to central medical laboratory.
3. }
4. }

Thursday, July 11:

1. The evacuation hospital.
2. Neurological problems in a general hospital.
3. Surgery in a combat division.
4. Map reading.

Friday, July 12:

1. Map and terrain exercises.
2. Organization and general activities of the section of orthopedic surgery.
3. Map and terrain exercises.
4. Principles of war surgery.
5. (4 p. m.). Demonstration of injection of novarsenobenzol.

Saturday, July 13:

1. } Neurological clinics at Base Hospital
2. } No. 117, and inspection of hospital
3. } train (leaving school in ambulances
4. } at 8.30 a. m.).

Sunday, July 14:

2. Shock.

Monday, July 15:

1. Personal and general hygiene.
2. Wounds of soft parts.
3. Physiological treatment of gassed cases.
4. Convalescent camps.

Tuesday, July 16:

1. Sanitation.
2. Otolaryngology.
3. Ophthalmology.
4. Field sketching.

Wednesday, July 17:

1. Principles and early treatment of bone and joint.
2. Injuries.
3. Trench fever.
4. Demonstration of splinting and heating apparatus.

Thursday, July 18:

1. } Field sketching exercise.
2. }
3. Venereal diseases.
4. Skin diseases.

Friday, July 19:

1. The disposition of combatant and auxiliary troops on the march and in intrenched positions.
2. Malingering.
3. War-wound infections and abdominal injuries.
4. Field sketching.

Saturday, July 20:

1. The disposition of combatant and auxiliary troops on the march and in intrenched positions.
2. Internal medicine in the Army.
3. Disordered actions of the heart.
4. Field sketching.

Monday, July 22:

1. The effects of the commonly used gases.
2. Sanitation.
3. Sanitary tactics.
4. The physiology of respiration.

Tuesday, July 23:

1. The causes of gas casualties.
2. The battalion surgeon.
3. } Departure for American front at
4. } 4.45 p. m.

Wednesday, July 24:

Arrival at American front.

Thursday, July 25 (at American front):

- 9.10 a. m.----- Lecture by division surgeon on "General description of sector."
 10 a. m. to 6 p. m.--- Class divided into four groups to visit regimental and battalion aid stations and observe trench conditions (one group to each regiment under regimental surgeon).

Friday, July 26 (at American front):

- 8 to 9 a. m.----- Lecture by commanding officer, sanitary train, on "Workings of ambulance companies and field hospitals."
 9 a. m. to 6 p. m.--- Group A to visit ambulance dressing stations, delousing stations, and field hospitals, operating as triages (F. H. 326 and 328) under the director, ambulance companies.
 Group B to visit immobilized field hospitals, caring for division sick (F. H. 325 and 327), and Evacuation Hospital No. 1 and Mobile Hospital No. 39.

Saturday, July 27 (at American front):

- 8 to 9 a. m.----- Lecture by commanding officer, Evacuation Hospital No. 1, on "Evacuation of wounded to the rear."
 9 a. m. to 6 p. m.--- Group A to visit immobilized field hospitals, caring for division sick (F. H. 325 and 327), and Evacuation Hospital No. 1, and Mobile Hospital No. 39.
 Group B to visit ambulance dressing stations, delousing stations, and field hospitals operating as triages (F. H. 326 and 328) under the director, ambulance companies.
 8 p. m. to 2 a. m.--- Class divided into four groups to visit regimental and battalion aid stations and observe trench conditions; one group to each regiment under the regimental surgeon. Groups to visit different regiments from those visited first day.

Sunday, July 28:

Return to school.

Monday, July 29:

1. Oral hygiene.
2. Chest surgery.
3. Maxillofacial injuries.
4. Field sketching.

Tuesday, July 30:

1. }
2. } Map and terrain exercises.
3. }
4. }

Wednesday, July 31, to Monday, August 5, inclusive:

Tour of instruction to Paris and vicinity.

Return to proper stations.

SIXTH SESSION (SECTION 11)

Daily, except Sundays and holidays, 6.45 to 7.15 a. m., drill and setting-up exercises.

First period, 9 to 10.30 a. m.; second period, 10.30 a. m. to 12 m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Tuesday, July 16, 1918:

1. Sanitation.
2. Otolaryngology.
3. Ophthalmology.
4. Field sketching.

Wednesday, July 17:

1. } Principles and early treatment of
2. } bone and joint injuries.
3. Trench fever.
4. Demonstration of splinting and heating apparatus.

Thursday, July 18:

1. Field sketching exercises.
2. Venereal diseases.
3. Skin diseases.

Friday, July 19:

1. The disposition of combatant and auxiliary troops on the march and in intrenched positions.
2. The ambulance company.
3. War-wound infections and abdominal injuries.
4. Field sketching.

Saturday, July 20:

1. The disposition of combatant and auxiliary troops on the march and in intrenched positions.
2. Internal medicine in the Army.
3. Disordered action of the heart.
4. Field sketching.

Monday, July 22:

1. }
2. } Gas instruction (beginning at 8.30
3. } a. m.).
4. }

Tuesday, July 23:

1. }
2. } Gas instruction (beginning at 8.30
3. } a. m.).
4. }

Wednesday, July 24:

1. The physiology of respiration as a basis for the treatment of gassed cases.
2. Wastage and replacements.
3. The ambulance company.
4. The battalion surgeon.

Thursday, July 25:

1. The pathology and treatment of gassed cases.
2. The evacuation of wounded in 1st Division.
3. Routine treatment of syphilis.
4. Shock.
- 3.45 p. m., demonstration of the injection of novarsenobenzol.

Friday, July 26:

1. Causes of gas casualties.
2. Some impressions on front-line work.
3. }
4. } Map problem.

Saturday, July 27:

1. Ordnance.
2. Obscure diseases on the war.
3. War nephritis.
4. Map problem.

Monday, July 29:

1. Oral hygiene.
2. Chest surgery.
3. Maxillofacial injuries.
4. Field sketching.

Tuesday, July 30:

1. }
 2. }
 3. }
 4. }
- Map and terrain exercises.

Wednesday, July 31, to Sunday, August 4, inclusive:

Trip to front.

Monday, August 5:

1. Field orders.
2. Histopathology and bacteriology of war wounds.
3. Bathing, delousing, and laundering.
4. Map reading.

Tuesday, August 6:

1. Convalescent camps.
 2. Food conservation.
 3. }
 4. }
- Demonstration at gas school.

Wednesday, August 7:

1. }
 2. }
 3. }
 4. }
- Visit to central medical laboratory.

Thursday, August 8:

1. Primary, primary delayed, and secondary suture.
2. Duties of a regimental and battalion surgeon.
3. The field hospital.
4. Regimental and battalion aid stations in this war.

Friday, August 9:

1. Surgery in a combat division.
2. Organization and general activities of the section of orthopedic surgery.
3. Thomas splint drill, etc.
4. Map reading.

Saturday, August 10:

1. Tetanus and gas gangrene.
2. The evacuation hospital.
3. Neurological problems in a base hospital.
4. Map and terrain exercises.

Monday, August 12:

1. } Neurological clinics at Base Hospital
2. } 117.
3. }
4. }

Tuesday, August 13:

1. Personal and general hygiene.
2. Wounds of the soft parts.
3. Physiological treatment of gassed cases.
4. Conference on course.

Wednesday, August 14:

- Departure for stations.

SEVENTH SESSION

Daily, except Sundays and holidays, 7.20 a. m., setting-up exercises.

First period, 9 to 10.30 a. m.; second period, 10.30 a. m. to 12 m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Wednesday, August 21:

1. Opening address.
2. Organization of the American Expeditionary Forces.
3. Mental hygiene.
4. The physiological and pathological effects of toxic gases.

Thursday, August 22:

1. } General gas instruction (beginning
2. } at 8.30 a. m.).
3. }
4. }

Friday, August 23:

1. } General gas instruction (beginning
2. } at 8.30 a. m.).
3. }
4. }

Saturday, August 24:

1. Disposition of auxiliary troops on the march and in combat.
2. The treatment of effects produced by suffocating gases.
3. The treatment of effects produced by vesicant gases.
4. Evacuation of wounded in a war of movement; experiences in the 1st Division.

Sunday, August 25:

1 p. m.

Symposium on the work of the 26th Division, American Expeditionary Forces, in the last Battle of the Marne.

Monday, August 26:

1. Disposition of auxiliary and combat troops on the march and in combat.
2. Military hygiene.
3. General personal hygiene.
4. Map and terrain exercises.

Tuesday, August 27:

1. Military hygiene.
2. Artillery and Infantry weapons.
3. Map and terrain exercises.
4. Causes of gas casualties.

Wednesday, August 28:

1. } Map and terrain exercises.
2. }
3. Baths, disinfection, and field laundries.
4. The regimental and battalion surgeon in a war of movement.

Thursday, August 29:

1. Reserve and front-line sanitation.
2. Fire cover, dugouts, camouflage, etc.
3. } Demonstration of Infantry and Medical Department; dugouts, camouflage, and gas offensive and defensive.
4. }

Friday, August 30:

1. Sanitation in billeting areas and troop movements.
2. Evacuation of wounded.
3. } Sanitary devices in the school area.
4. }

Saturday, August 31:

1. Ambulance company.
2. The regimental and battalion surgeon; and the battalion aid station in trench warfare.
3. Field sketching.
4. The 4th Division in the second Battle of the Marne.

Sunday, September 1:

- 10.30 a. m. Early treatment of head and chest cases.

Monday, September 2:

1. Histopathology of war wounds.
2. The American Red Cross.
3. Internal medicine in the Army.
4. Consideration of the heart under war conditions; the effort syndrome.

Tuesday, September 3:

1. Bacteriology of war wounds.
2. The use of gum solutions in shock.
3. Field orders.
4. Wastage and replacements.

Wednesday, September 4:

1. Primary and primary delayed suture.
2. The Thomas splint drill and splinting in general.
3. Shock.
4. General considerations in the wounds of war.

Thursday, September 5:

1. General considerations in the wounds of war.
2. Field duties of division and corps surgeon.
3. Organization and general activities of the section of orthopedic surgery.
4. Field orders.

Friday, September 6:

1. } Field sketching.
2. }
3. Practical resuscitation of wounded suffering from shock.
4. Blood transfusion.

Saturday, September 7:

1. Field transportation.
2. The Army kitchen and the feeding of men; conservation of food.
3. Conference on map problem.
4. Nature and early treatment of bone and joint injuries.

Monday, September 9:

1. } Field sketching.
2. }
3. Roentgenology in this war.
4. Neurological problems in Army hospitals.

Tuesday, September 10:

1. } Map and terrain exercises.
2. }
3. The intervention of the military surgeon in ophthalmological cases.
4. Maxillofacial injuries.

Wednesday, September 11:

1. }
2. } Neurological clinic at Base Hospital
3. } 117.
4. }

Thursday, September 12:

1. } Map and terrain exercises.
2. }
3. } The field hospital.
4. }

Friday, September 13:

1. } Map and terrain exercises.
2. }
3. } Evacuation hospital.
4. }

Saturday, September 14:

1. } Map and terrain exercises.
2. }
3. The prevention and treatment of venereal disease in the American Expeditionary Forces.
4. Skin diseases.

Monday, September 16:

1. Tetanus and gas gangrene.
2. Abdominal wounds.
3. The division of laboratories in the American Expeditionary Forces.
4. General orders, bulletins, and circulars, American Expeditionary Forces.

Tuesday, September 17:

1. } Map problems.
2. }
3. Convalescent camps.
4. Gas instruction.

Wednesday, September 18:

1. }
2. } Map problems.
3. }
4. }

Thursday, September 19:

- Departure for front.

EIGHTH SESSION

Daily, except Sundays and holidays, 7.20 a. m., setting-up exercises.

Daily, 7.45 a. m., breakfast.

(NOTE.—The numbers after the titles refer to articles in the mimeographed literature of the school which should be studied the day previous. When there are many numbers and time is limited, use index in making selection.)

First period, 9 to 10.30 a. m.; second period, 10.30 a. m. to 12 m.; third period, 1.30 to 3 p. m.; fourth period, 3 to 4.30 p. m.

Wednesday, October 16:

1. Opening remarks.
2. Organization of the American Expeditionary Forces (141).
3. Organization of the surgical services in the American Expeditionary Forces.
4. Mental hygiene (40, 52).

Thursday, October 17:

1. Tactics (151).
2. Artillery and infantry weapons.
3. The field hospital and ambulance company (135, 54, 73, 76, 91).
4. Map reading; lecture.

Friday, October 18:

1. Disposition of combat and auxiliary troops on the march and in combat.
2. Map reading; lecture.
3. Histopathology of war wounds (55, 119).
4. General personal hygiene (4, 5, 7, 34, 116, 118, 130); 8.30 p. m. Shock (46, 109, 115).

First period, 8.30 to 9.30 a. m.; second period, 9.40 to 10.40 a. m.; third period, 10.50 to 11.50 a. m.; fourth period, 1.30 to 2.30 p. m.; fifth period, 2.40 to 3.40 p. m.; sixth period, 3.50 to 4.50 p. m.

Wednesday, October 23:

1. Evacuation of wounded (1, 2, 11, 20, 27, 50, 64, 92, 120, 138).
2. Regimental and battalion surgeon, and the battalion aid station in trench warfare (9, 13, 14, 18, 19, 100, 102, 103, 104, 120, 143).

6. The prevention and treatment of venereal diseases in the American Expeditionary Forces (7, 8, 16, 125).
- 7.30 p. m. Venereal diseases; skin diseases (31, 39, 56, 107, 108, 134).

Friday, November 1:

1. Discussion.
2. Thomas splint drill and splinting in general (10, 45, 68, 85).
3. The nature and early treatment of bone and joint injuries (81, 93, 94, 95, 96, 131).
4. } General considerations in the wounds
5. } of war (33, 43, 74, 131, 137).

Saturday, November 2:

- Class divided into two sections.
Section I left for two weeks' tour of instruction to front.
Section II left for the central Medical Department laboratory at Dijon for a 3-day course in methods of treatment of shock and hemorrhage.

NINTH SESSION

Daily, 7.45 a. m., breakfast.

(NOTE.—The numbers after the titles refer to articles in the mimeographed literature of the school which should be studied the day previous. When there are many numbers and the time is limited, use index in making selections.)

First period, 8.30 to 9.30 a. m.; second period, 9.40 to 10.40 a. m.; third period, 10.50 to 11.50 a. m.; fourth period, 1.30 to 2.30 p. m.; fifth period, 2.40 to 3.40 p. m.; sixth period, 3.50 to 4.50 p. m.

Saturday, November 2:

Clinic at Base Hospital No. 53.

Monday, November 4:

Departure for central Medical Department laboratory.

Tuesday, November 5:

Course in shock and hemorrhage and the treatment of these conditions, at central Medical Department laboratory.

Wednesday, November 6:

Course in shock and hemorrhage and the treatment of these conditions, at central Medical Department laboratory.

Thursday, November 7:

Return to Army Sanitary School.

Friday, November 8:

Lecture, demonstration, and drill in the use of the Thomas splint and other splints.

Saturday, November 9:

The treatment of venereal cases, clinic.

Monday, November 11:

1. The Army kitchen and the feeding of men: Conservation of food (42, 51, 135).
2. Mental hygiene (40, 52).
3. Evacuation of wounded (1, 2, 11, 20, 27, 50, 64, 92, 120, 138).
4. The field hospital and ambulance company (135, 54, 73, 76, 91).
5. The regimental and battalion surgeon and the battalion aid station in trench warfare (9, 13, 14, 18, 19, 100, 102, 103, 104, 120, 143).

- 1.30 to 3 p. m. The ambulance company and the field hospital (13, 14, 18, 19, 73, 76, 91, 102, 103, 104, 110, 145).
- 3 to 4.30 p. m. Organization of the American Expeditionary Forces (141b).

Friday, November 22:

1. The medical problem of regiments and battalions (25, 26, 55, 58, 126, 129).
2. Map reading; lecture.
3. The prevention of venereal diseases (7, 8, 16, 125).
4. The treatment of venereal diseases (31, 39, 56, 107, 108, 134).
5. Neurological problems in army hospitals.
6. War neuroses (pamphlet in library).

Saturday, November 23:

1.)
2.)
3.) General gas instruction.
4.)
5.)
6.)

Monday, November 25:

1. Area sanitation (25, 26, 55, 58, 126).
2. Disposition of combat and auxiliary troops on the march and in combat.
3. Sanitary tactics (151, 153).
4. Map reading; lecture.
5. The regimental surgeon.
6. The functions of the director of ambulance companies.

Tuesday, November 26:

1. Map reading; lecture.
2. Disposition of combat and auxiliary troops on the march and in combat.
3. The treatment of effects produced by mustard gas (72, 132, 139, 140, 147).
- 1.30 to 3 p. m. Shock and hemorrhage and the treatment of these conditions (106).
- 3 to 4.30 p. m. Shock and hemorrhage and the treatment of these conditions (106).

Wednesday, November 27:

1. The treatment of effects produced by phosgene (72, 132, 147).
2. Field transportation.
3. The division psychiatrist.
4. The division orthopedist.
5. The division medical supply officer.
6. { Skin diseases.
- Venereal diseases.

Thursday, November 28:

Thanksgiving Day.

Friday, November 29:

1. The care of wounded in advance areas.
2. Investigation and treatment of shock (46, 115).
3. Chest wounds (44).
4. Chest wounds (44).
5. Sanitation in corps areas (25, 26, 55, 58, 126).
6. Consideration of the heart under war conditions; the effort syndrome (136).
7. Convalescent camps (23, 122, 128, 149).

Saturday, November 30:

1. General orders, bulletins, etc., American Expeditionary Forces (141b, 150, 152).
2. Artillery and Infantry weapons (117).
3. Skin diseases in the American Expeditionary Forces.
4. The mobile hospital.

Monday, December 2:

1. Medical supplies.
2. The division urologist.
3. The duties of the evacuation officer of an army.
4. }
5. } The organization and general activities of the division of orthopedic surgery.
6. }

Tuesday, December 3:

1. }
2. } Problem; billeting and moving.
3. }
4. The intervention of the military surgeon in otolaryngological cases (127).
5. Duties of the director of ambulance companies.
6. The divisional medical supply officer.

Wednesday, December 4:

1. }
2. } Problem; defense plans.
3. }
- 1.30 to 3 p. m. Duties of the director of field hospitals.
- 3 to 4.30 p. m. The evacuation hospital.

Thursday, December 5:

1. }
2. } Problem; defense plans.
3. } General considerations in the wounds of war (17, 33, 43, 74, 97, 131, 137).
4. }
5. } Film; "Fit to Fight."
6. }

Friday, December 6:

Return to proper stations.

The following problems were given in connection with the training in Field Service Regulations and sanitary tactics:^c

MAP PROBLEMS NOS. 1 TO 20, INCLUSIVE (DECEMBER 1, 1917, TO DECEMBER 17, 1918)

I. Miscellaneous problems in map reading: February 5, 8, 11, 19, 20, 21, 1918.

II. General problems in sanitary tactics (open warfare): Problem I, Problem I (solution), Problem II, Problem II (solution), Problem III, Problem III (solution), Problem IV, Problem V.

III. Specific problems in sanitary tactics (with required map): Problem VI (with solution), sanitary service of an Infantry division intrenched in defense (issued by G-5, general headquarters, A. E. F.). Problem VII (with solution), distribution of equipment and personnel and transportation (based on Problem VI). Problem VIII (with solution), a move by rail with "Notes on tactical moves," and Tables of Organization. Problem IX (with solution), relief of a division in the line, with "Notes on reconnaissance and relief." Problem X (with solution), "A division in defense" (following the St. Mihiel offensive). Problem XI (with solution), a raid by two battalions (sequel to problem E). Problem XII, a division in attack (with solution). The beginning of the Foret d'Argonne offensive with "Notes on attack." Problem XIII (with solution), difficulties arising during attack. Part I. Road block; Part II. Liaison, with "Notes on liaison."

NOTE.—Problems X to XIII, Part I (inclusive), are based on actual situations that arose in the American Expeditionary Forces, and the orders used are extracts from the actual orders as issued.

^c Problem No. IX is reproduced in this volume as an example of the problems given.

MAP PROBLEM IX

(Map of Langres, 1:20,000)

The sanitary service of a regiment during the relief of a division in the line.

(a) General situation:

The American 2d Division holds the Langres sector of the line, Chanoy—Humes—Brevoines—St. Geomes—Cohons, facing west.

The American 1st Division is located in corps reserve in the Lecey area.

At 8.30 a. m. on September 13 the following telegram is received from the First Corps (headquarters at Plesnoy):

The American 2d Division will be relieved in the line by the American 1st Division. Relief to be completed by September 20. Arrangements between divisions. Completion of relief to be reported by wire. Acknowledge.

(b) Special situation:

The 1st Infantry is billeted as follows: Headquarters 1st Infantry, Mont Landon; 1st Battalion, Mont Landon; 2d Battalion, 3d Battalion, Celsoy.

At 6 p. m., September 14, the colonel, 1st Infantry, sends for the regimental surgeon and gives him the following instructions:

This regiment will relieve the 8th Infantry which now occupies the subsector on the extreme left of the divisional sector. The relief will begin on September 17 and will be carried out as follows:

On September 17 the 2d Battalion, 1st Infantry, will relieve the reserve battalion, 8th Infantry. Relief to be completed by noon.

The 1st Battalion, 1st Infantry, will march so as to reach the support line at 10 p. m., relieving the support battalion, 8th Infantry.

On September 19, the 3d Battalion, 1st Infantry, will relieve the 2d Battalion, 1st Infantry, by noon; after dark the 2d Battalion will relieve the 1st Battalion, 1st Infantry, and the 1st Battalion, 1st Infantry, will move forward and relieve the battalion, 8th Infantry, now in the line.

You will go ahead with our advance party. Motor transportation will be provided for the party. It will leave here to-morrow at 1 p. m. Examine the sanitary situation carefully and be prepared to go over your findings with me on the 16th. You will meet me at the post of command, 8th Infantry, at 6 p. m., September 16."

The regimental surgeon, 8th Infantry, says he will turn over to the 1st Infantry the following list of trench stores, now distributed throughout the regimental sector:

Thomas half ring length and leg splints (BK)	18
Thomas arm splint (hinged) Murry's modification	12
Wire, gauze rolls	24
Stretcher bars	18
Z. O. adhesive:	
5-yard rolls	4
2-inch rolls	12
Standard litters	24
Blankets	50
Burner's oil	6
A. T. S. (1, 500 units each)	2, 000
French gas masks	200

Front dressing packets, assorted sizes. Exact number unknown, but thinks there are a good many.

Requirements.—(1) As regimental surgeon of the 1st Infantry relieving the 8th Infantry, make the actual reconnaissances and submit a written report to the division surgeon, 1st Division, covering the following points:

(a) Date and hour at which reconnaissances were made.

(b) Adequacy of present sites occupied by aid posts, and changes recommended, if any are desired.

(c) A list of trench stores (not included in regimental combat equipment) that will be needed to supplement those taken over from the 8th Infantry.

(2) As battalion surgeon of the 1st Battalion, 1st Infantry, relieving the battalion, 8th Infantry, in the line, write out in detail your action immediately prior to and during the relief.

A SOLUTION TO MAP PROBLEM IX

OFFICE OF SURGEON, 1ST INFANTRY,
September 16, 1918—8 p. m.

From: Regiment surgeon, 1st Infantry.

To: Division surgeon, 1st Division.

Subject: Report of reconnaissance of left subsector, 2d Division.

Requirement I

1. The following recommendations are based on reconnaissances made after 8 p. m., September 15, and between 5 and 7 a. m., September 16.

2. (a) Aid station, first-line battalion, is very far to the right of the sector and 300 m. from battalion P. C. The dugout, however, is excellent. No change recommended at present.

(b) Aid station, support battalion, is located away from trenches on high ground in an open field. Have planned to reserve this for handling of gassed cases only. Regiment aid station is so located as to be able to care for support battalion for the present.

(c) Aid station, reserve battalion, has both a good location and an excellent dugout. Owing to the proximity of the ambulance dressing station (250 m.), have planned, subject to approval of director of ambulance company, to hold in reserve the station of reserve battalion, equipped and ready for use, as an alternative ambulance head in case shelling makes either untenable. The ambulance dressing station can then serve the reserve battalion direct. I can reinforce their station with my personnel if necessary.

3. The following list of trench stores will be needed to supplement those taken over from the 8th Infantry:

Adhesive Z. O.:		Splints:	
1-foot roll.....	6	Arm hinge.....	12
2½-inch.....	12	Cabot.....	24
Ambrine packages.....	8	Gauze, wire, roll.....	12
Bandages:		Leg, T, half ring.....	24
Muslin, 4-inch.....	50	Liston.....	6
Muslin, 6-inch.....	50	Wire, ladder.....	75
Triangle.....	75	Wood—	
Basins, 1-quart (Ambrine).....	4	3-foot.....	12
Blankets.....	100	4-foot.....	12
Bottles, hot water.....	24	Stirrup, Sinclair.....	24
Boxes, Amb. dressing (par. 866, manual		Stove, shock.....	10
of the Medical Department).....	10	Straps and buckles.....	75

Overalls, gas..... do.....	10	Glass..... do.....	10

NOTE.—This is special surgical equipment and not intended to replace battalion combat equipment, paragraph 866, Manual for the Medical Department, but will be in addition to it.

X,

Major, Medical Corps.

Requirement 2.—Upon notification (morning of September 15) by battalion major of the proposed relief; advise that the battalion be given, on September 16 (1) a complete physical inspection including feet; (2) a special gas drill, with careful inspection of gas masks.

September 15: Check over the battalion's share of the regimental combat equipment. Inspect equipment of Medical Corps detachment. Go over with them: (1) The care of gassed cases; (2) the importance of secrecy in all moves; forbid discussion of move; (3) action to be taken in case of capture.

September 16: Hold physical inspection of battalion; talk to them on "care of feet" in trenches. Evacuate all sick with command. Move forward with the battalion.

September 17: Distribute two dressers and a litter to each company. The rest of the detachment, I divide with assistant battalion surgeon. I take the head of the battalion and he stays with the rear group. Division surgeon has arranged to have a horse ambulance assigned to the battalion for the march. This is held at the rear of the battalion.

10 p. m.: I relieve the battalion surgeon 8th Infantry. I find my regimental surgeon has arranged for him to leave his assistant battalion surgeon and two enlisted men with me until the night of September 18. As soon as my assistant battalion surgeon arrives, I leave him at the battalion aid station and go over to regimental aid station. I get all the details of situation from regimental surgeon. I open only enough equipment for emergency work, in view of the short stay at this point.

September 18, at daybreak, I go up to the first line battalion aid station and with the battalion surgeon, 8th, make reconnaissances of fire trenches, company aid posts, routes of evacuation, number and location of the "direction markers" for litter bearers, gas curtains of dugouts, water bags, trench latrines, drying facilities, etc.

September 18, at nightfall, I send my assistant battalion surgeon up to make similar reconnaissances. Send one litter squad along to remain there and become familiar with the trenches prior to the relief.

I carry out the relief on the night of the 19th, relieving all men at battalion aid station and in company aid posts of the first line battalion.

Sample of a march and relief table (accompanying a field order)

[All units except sanitary train omitted]

Serial	Date	Unit		Move		Route	Remarks
		1st Division	2d Division	From—	To—		
13	July 16	One company (horse), field hospital section, sanitary train.		Monchy-au-Bois	Achiet-le-Grand	Bucquoy	To be clear of Monchy by 8 a. m. ^a
14	do	One company (motor), field hospital section, sanitary train.		Basseux	do	Berles-au-Bois—Monchy-au-Bois—Bucquoy	Not to enter Berles-au-Bois before 12 noon. ^a
15	do	do		Boiry-Sté. Rietrude	Henin-sur-Cojeul	Direct	To take over dressing station; not to pass Boisseux-au-Mont before 4 p. m.
16	do	Field hospital company (motor), field hospital section, sanitary train.		Ayette	Croisilles	Courcelles and Ervillers	To take over dressing station; not to pass Ervillers before 9.30 p. m.
17	do	2 companies (motor), ambulance section, sanitary train.		Hannescamps	Boisseux-St. Marc	Monchy-au-Bois—Boisseux-au-Mont	Not to enter Monchy-au-Bois before 12 noon.
18	do	1 company (motor), 1 company (horse), ambulance section, sanitary train.		do	Ervillers	Bucquoy—Courcelles	Not to enter Courcelles before 12 noon.
19	do		1 company (horse), field hospital section, sanitary train.	Achiet-le-Grand	Monchy-au-Bois	Bucquoy	On relief.
20	do		1 company (motor), field hospital section, sanitary train.	do	Basseux	Bucquoy—Monchy-au-Bois—Berles-au-Bois	Do.
21	do		do	Henin-sur-Coteul	Boiry-Sté. Rietrude	Direct	Do.
22	do		do	Croisilles	Ayette	Courcelles and Ervillers	Do.
23	do		2 companies (motor), ambulance section, sanitary train.	Boisseux-St. Marc	Hannescamps	Boisseux-au-Mont—Adouler—Monchy-au-Bois	Do.
24	do		1 company (motor), 1 company (horse), ambulance section, sanitary train.	Ervillers	Hannescamps	Courcelles—Bucquoy	Do.

• To take over casualty clearing station (Achiet); arrangements between medical officers concerned.

NOTES ON RECONNAISSANCE AND RELIEF

(For issue in connection with map problem No. IX)

Study Field Service Regulations, pars. 9 to 32.

The formal relief of combat units in the line is a most frequent event. It is carried out by divisions within Army Corps; by battalions within divisions; by companies within battalions. In trench warfare it serves a twofold purpose in that troops on the firing line are prevented from "going stale" and opportunity is afforded for periods of training and rest of a degree which is impossible while actually in the line. In open warfare temporary checks will certainly occur entailing reliefs in the front line of the advancing columns. As in the case of all troop movements, success depends upon teamwork in which every detail has been thought out and provided for in advance. This is ordinarily done and issued in the form of an administrative order prepared by the G-1 branch of the divisional staff. Occasionally when a relief is of a very hurried nature, supplementary instructions may be necessary. Upon the division order, subordinate commanders in turn base their instructions to their subordinates and so on down to the last soldier. In the case of hurried reliefs the younger officers must take the initiative and not wait for those higher up. This demands that they have thought out their course of action often enough to be in a position to interpret in their act the will of their commander.

The movements of the troops in and out of the line may be carried out by road march, bus and trucks, or tactical trains, according to distances to be covered and the condition of the men. Billeting parties should invariably be sent forward by march or truck 24 hours ahead of their units, with suitable advance parties for taking over any trench stores, dumps, etc. As soon as possible after the orders for the relief are received the commanding general and a representative of each branch of the staff proceed to the new area in order to hold the necessary conferences and make any desired reconnaissances. The G-1 representative at once notifies his technical advisers. The division surgeon is the one with whom we are especially concerned—and they proceed to the new area to familiarize themselves with the new situation.

The division surgeon will consult, first, with his new corps surgeon and then with the division surgeon of the area which he is to take over. His reconnaissances will include the situation of battalion aid and ambulance dressing stations, stations for slightly wounded, locations of field hospitals, and ambulance companies, routes of evacuation, quantity and quality of the water supply, sanitation and bathing facilities. He will also make inquiry regarding the enemy's shelling routine and the location of any regularly shelled points; any outstanding features of the situation and finally (if necessary from his division G-1) the defense scheme which has been adopted for the area—especially the section dealing with gas defense. This information will then be distributed and certain phases turned over to selected subordinates for further investigation.

In the meantime the divisional staff will have drawn up a general plan to which the details of the relief will be made to conform. It is the policy to allow subordinate commanders to arrange their own methods of relief in accordance with the general plan. This is especially true with regard to the medical units. Consequently it is all the more important that they understand fully the entire system of relief, in order that the plans they submit be reasonable. The division surgeon is asked to submit draft tables of relief to be woven into the general table of relief and made to coincide with the total scheme. This latitude is given because the medical units and certain other branches like the Engineers and Artillery serve a dual interest as they participate in general schemes reaching outside the divisional limits. The corps medical officers initiate and control the territorial responsibility of the divisional Medical units.

The plan of relief is adapted to each local situation but in general observes the following rules:

The front-line Infantry of contiguous regimental fronts are not relieved simultaneously.

The relieving unit should be in support or reserve the day before relieving a front line unit to allow for final reconnaissances and the completion of arrangements generally.

The Infantry and machine guns in a regimental sector should not be relieved on the same day.

All the batteries in a Field Artillery battalion should not be relieved on the same day. Guns are usually exchanged instead of moving them from their emplacements.

Combat equipment is exchanged as far as possible. Trench stores are taken over and signed for. This applies especially to the equipment of aid stations.

Regimental surgeons are usually sent forward with the advance parties, to familiarize themselves with the locations of the aid stations, and take over any medical stores which will be left by the outgoing units. It is customary in a divisional relief for at least one medical officer of the outgoing regiment to remain 24 hours if necessary after the relief of his unit—until the new medical group is functioning smoothly.

Ordinarily, when time permits, the relieving division moves up into a corps staging area immediately in the rear of the first line division, and the units exchange places observing the rules just cited. It is important to arrange for guides to meet the new units going in at night and conduct them in small groups to their new post. This requires clear and concise arrangements. Simplicity is the secret of success.

The supply question during relief is usually carried out by mutual arrangement. The division holding the area is responsible in either case for all troops in its area and changes with the change of command. In fact all units entering the new area are under the command of the commanding general of the division being relieved, until the command passes which is usually upon the relief of the last unit in the front line.

It is the policy of relieving divisions to occupy the billets and horse standings of the previous similar unit. It is a good general rule not to change anything, except in the case of glaring defects, until you have tried it out a while.

There are so many details to be arranged that no matter how much time there is it will never seem enough. You will always feel that the division being relieved is taking away more equipment than it should and also that they are not taking sufficient precautions to conceal the relief, which is often true owing to the relaxation of the troops upon being relieved. These are some of the difficulties which require considerable tact if they are to be properly dealt with.

Every precaution must be taken to prevent the enemy becoming aware that the relief is in progress—for the hour of relief is the most vulnerable point of a combat unit's normal life. This fact is known to the enemy and always taken advantage of in case the relief is detected while in progress. It is essential that there be no departure from the usual appearance of the sector. All reconnaissances should therefore be made in the very early hours of the morning or late in the evening. If there is any departure from the habits of the relieved units, it is quickly noted in the observation posts of the enemy and surprise attacks will be quickly delivered in order to obtain identifications and knowledge of the relieving unit. If any changes are to be made in the new sector they should be made only after the relieving division has become settled in the sector and knows the need of the changes from actually living there. I heard Major General Duncan say that at the battle of Regiments, the regiment made two attacks in 5 days, advancing their line absolutely according to schedule as planned, but were relieved at the end of 12 days in the line. The enemy obtained information of the relief going on, and the losses of this regiment in withdrawing were as great as they had been during the two attacks.

In order to make observation from hostile airplanes difficult, the following rules should be adhered to:

(1) While a hostile plane is directly overhead, stand perfectly still; if the plane is seen approaching, and time permits, get in the shadow of a tree or house before he gets overhead.

(2) Trucks and ambulances should be stopped to one side of the road in the shadow of trees or along the edge of a wood or in a town.

(3) At night—when a flare or star shell suddenly bursts—stop moving until darkness again intervenes.

(4) Camouflage is only valuable if put up before any changes of the ground are made. Remember that camouflage in itself arouses the enemy's curiosity.

(5) Smoke can give away the location of rolling kitchens. The practice of lining up with mess kits should not be used in forward areas. A shell directed at a rolling kitchen may get the whole line.

During a relief it is essential that the Medical Department function smoothly. It must at no moment be unprepared for casualties due especially to a hospital raid or gas attack. The medical units must continually bear in mind the main issues:

1. The interest of the outgoing units.
2. Security during the relief.
3. Security immediately after the relief.
4. The comfort of all troops.

Simultaneously with the school for medical officers, there was established a section for officers of the Dental Corps,⁴ the history of which follows.

DENTAL SECTION ^d

ORGANIZATION AND INSTRUCTION

With the arrival of the first contingent of the American Expeditionary Forces in France, the question of training officers and men in various arms of the service became one of the most serious problems. In a large measure the men who composed the 1st Division had seen previous service, thus making the training problem more simple. However, officers of the Dental Corps, drawn largely from civil life, were badly in need of organized instruction before they could function in their proper capacities. Their ideas and standards of dental service had their foundation in long-established customs of civilian life, where equipment was complete and where environment was more favorable for the practice of the profession. The new conditions as presented in France at the start seemed to bring up the difficulties of proper adaptation and proper observance of military discipline. There was a serious demand for efficient training in Army Regulations, military discipline and customs of the service, Manual for the Medical Department, and Manual for Courts-Martial. Furthermore, in anticipation of future needs some courses in oral surgery and in oral surgical prosthesis were deemed necessary. Plans were made, therefore, for organized training of officers of the Dental Corps, and the first program for school instruction of dental officers was prepared by the chief of the dental section of the personnel division of the chief surgeon's office.

The demand for organized instruction was begun in the 1st Division by a course of training instituted by the division surgeon, who later became commandant of the Army Sanitary School, and by the division dental surgeon, later acting director and assistant director of the dental section of this school. This instruction anticipated the demand which was later felt for training in first aid, bandaging, and dressing, and, with the exception of the lectures on oral surgery, was quite similar to the course which was given during the first session of this school, from December 10 to 17, 1917 (q. v., p. 648.).

The aims of the representative of the Dental Corps in the Chief Surgeon's Office, in presenting the plans for the training school for dental officers, are set forth in the following communication from that officer to the commandant of the Army Sanitary School:

^d The statements of fact appearing herein are based on: "History of the Dental Section of the Army Sanitary School, Army Schools, American Expeditionary Forces, France, December 10, 1917, to December 10, 1918." (Compiled from the official records of the school.) The history is on file in the dental division, Surgeon General's Office, Washington, D. C.—*Ed.*

HEADQUARTERS AMERICAN EXPEDITIONARY FORCES,

November 18, 1917.

Memorandum in re dental section of the Army Sanitary School, A. E. F.

1. Assignments: In view of the scope and character of instruction contemplated in the dental section of the Army Sanitary School it is recommended that two specially qualified dental surgeons be assigned as instructors thereat. One of the senior dental surgeons of the Army has been requested for this detail by cable to the Surgeon General November 17. The only other available man in France with special qualifications for this detail is Lieutenant Rice, on duty as division dental surgeon, 1st Division, Gondrecourt. Lieutenant Rice will be a major under recent enactment of law, October 6, 1917. He has had experience as recorder at the Army Dental School conducted by the undersigned last year at Fort Bliss, Tex., for the instruction of National Guard officers, and has within the past few months conducted the 1st Division school for instruction of dental officers (reserve) of that command. It is believed Major Rice is sufficiently capable of conducting the dental section of the Army Sanitary School until the arrival of the senior dental officer requested above.

Attention is invited to the following program of instruction for the dental section, Army Sanitary School, which has been carefully considered and modified to meet the requirements of that institution.

2. Program of instruction:

First day:

7.45 a. m. to 11.45 a. m. -- Duties of dental officers serving with sanitary organizations at regimental and battalion aid stations and field hospitals (administration and records, admissions, evacuation and transportation).

1.30 p. m. to 4.30 p. m. -- Practical instruction in gas defense.

Second day:

7.45 a. m. to 11.45 a. m. -- First aid to the wounded embracing: Hemorrhage, wounds and dressings, fractures, tetanus, shock, nutrition.

1.30 p. m. to 4.30 p. m. -- Demonstrations in the use of field equipment, dental and medical.

Third day:

7.45 a. m. to 9.30 a. m. -- Bandaging and splinting (general).

9.30 a. m. to 11.45 a. m. -- The sanitary service in the zone of the advance (general).

1.30 p. m. to 4.30 p. m. -- Dental surgery at the front, first aid for jaw cases, surgery, dressings, and transportation (ambulatory and litter).

Fourth day:

7.45 a. m. to 11.45 a. m. -- General and local anæsthetics (technique and administration).

1.30 p. m. ----- Special duties in which dental officers may be utilized in emergencies.

2.30 p. m. ----- Oral manifestations of systemic diseases.

3.30 p. m. to 4.30 p. m. -- Pathodontia; relation of oral diseases to systemic infection, or oral surgery to rhinology, otology, laryngology, and ophthalmology.

Fifth day:

7.45 a. m. ----- Dental sterilization and method employed in the field.

8.45 a. m. ----- Wounds of the jaw.

9.45 a. m. to 11.45 a. m. -- The interrelation of the oral and dental surgeon with the brain surgeon, general surgeon (plastic), nose and throat surgeon, and eye and ear surgeon in the work contemplated for the head surgical teams.

1.30 p. m. to 3.30 p. m. -- Oral surgical prosthesis.

3.30 p. m. to 4.30 p. m. -- Military duties of the dental officers. (Equitation, elementary, motor-car technique—driving, mechanism, and minor repairs.)

Sixth day:

- 7.45 a. m.----- Oral hygiene.
 9 a. m.----- Special oral surgery.
 1.30 p. m.----- Personal hygiene.
 2.30 p. m. to 4.30 p. m.-- Oral surgical prosthesis.

NOTE.—Student officers for this course to be selected from those on duty in divisions or separate brigades, who have previously taken the course prescribed for the division dental school.

3. Division dental schools (and for separate brigades); a course of instruction conducted by the division dental surgeon under the direction of the division surgeon:

(a) Army Regulations (pertaining to officers in general, and Medical Department officers in particular).

(b) Manual for the Medical Department (dental instruction and administration).

(c) Manual for Courts-Martial and Military Law (administration of military discipline and justice, charges, specifications, trials, etc.).

(d) Customs of the service.

(e) Paper work (correspondence, records, reports, and returns).

4. Correspondence course of instruction for dental officers stationed at base hospitals, engineer regiments and other isolated commands:

To cover preceding subjects of instruction and conducted from the Army Sanitary School in accordance with plans followed in the usual correspondence course for medical officers of the Army.

5. A post-graduate school of instruction:

To be established at the American Red Cross Hospital No. 1, Neuilly, under the direction of the commanding officer. Said course to embrace lectures on hospital administration, admissions, evacuations, records, diet, internal economy, etc., by Lieut. Col. George P. Peed; and oral surgical technique (major and minor) by Majors Hutcheson and Powers. Clinical oral surgical prosthesis (technique, construction, records, cases, etc.), and special dental X-ray and photographic instruction by Dr. George P. Hayes. Student officers for the post-graduate course to be selected from those specially qualified or who show special aptitude for oral surgery and oral surgical prosthesis; selection to be made on the recommendation of the chief surgeon, A. E. F., and the commandant of the Army Sanitary School.

NOTE.—The course of instruction at the division schools may be handled in six to eight sessions, held two afternoons per week for the period. The duration of the term for instruction at the Army Sanitary School (dental section) is contemplated as one week. The period of instruction at the post-graduate school may be covered in two weeks intensive study. This may be extended in certain particular cases where deemed desirable for the best interests of the service.

Prior to the completion of the organization of the First Army Corps, although coincident with the plans for corps training, a program was instituted for a school for dental officers as a part of the First Corps Army Sanitary School. However, the sanitary school was later moved as a part of the Army schools, at Langres, and this course was never given, although the program of instruction was incorporated in the courses which were given during the first two months of the school at Langres.

It was the original intention to institute courses of instruction for dental officers not only at the Army Sanitary School, but throughout the various Army corps, as well as in the divisions. In some divisional organizations, good results were gained, but, as a rule, the difficulties of transportation and the conditions in general were such as to make continuous training for dental officers impracticable. The plans for corps schools for dental officers were instituted and a program for a course at the headquarters of the First Army Corps was laid out, but there is no record that any school was ever established in corps organizations in France for dental officers.

It will be recalled that it was not until February, 1918, that American troops occupied the front lines to any extent. Prior to this time, the majority of all instruction for dental officers was experimental and speculative, for no one knew and no one could prophesy what combat conditions would be for dental officers. No parallel could be drawn from the experiences of our Allies, for in no army is the allowance of dental personnel as complete as in our own. Nothing could be foretold of the difficulties which would arise in the transportation of the portable outfits, soon proven to be hopelessly bulky. No one could foresee that the dental officer would be called upon for almost every other duty as well as that of dental work, such as battalion or regimental surgeon, sanitary inspector, censor officer, mess officer, burial officer, and many others. It is apparent that the problem of adequate instruction was a serious one.

After American troops finished their preliminary training and began to occupy different sectors on the Western Front, it was found that the training of dental officers in routine subjects of military administration was not sufficient. For instance, while the tables of organization allowed enough medical officers to a combat division to do all necessary medical work during quiet periods, actual combat conditions found the number insufficient, and the dental officer began to be employed in an auxiliary medical capacity. Furthermore, every division found its transportation problem a difficult one, and it was impossible in many instances to bring the heavy portable outfit to a place where it could be used to advantage. In fact, this worked two ways. In the first place, there were no transportation facilities to insure the carrying of the dental equipment with the regiments into combat, and, if through some fortunate chance the outfit did arrive in the combat area, the dental officer found himself in a position where dental work was impossible, and where the excitement of battle left little time for constructive dental work. Consequently, he either performed what duties the Medical Department demanded of him or there was little left for him to do.

This was the problem which confronted the director of the dental section of the Army Sanitary School as soon as the facts became known. Two courses were open. In the first place, the elimination of the larger part of the portable dental outfit, in favor of a small, easily transportable equipment, by means of which the dental officer could render the emergency service demanded of him while in combat. Secondly, and by no means less important, it became the obligation of the dental section of the Army Sanitary School, and the duty of division dental surgeons, to see that dental officers on duty with combat troops were trained in the proper performance of the duties required of them should they replace or function with the medical officers.

To this end, the courses at this school were modified to teach less in detail the more professional and theoretical subjects and to lay more emphasis upon first-aid bandaging and splinting, map reading, orientation, field sketching, sanitation, hygiene, and evacuation of the wounded. The program for the fifteenth session (p. 658, *infra*) demonstrates the policy of the school shortly before its close. In brief, the school gradually developed into a field service institution, and laid its greatest emphasis upon the preparation of dental

officers for combat service. The officer in the combat division had to live the life of the infantryman, and he had to be able to hike where the organization went. The classes of student officers of this school received training in Infantry drill for over seven months as a part of their course of instruction. They were subject to strict military discipline at all times; in other words, they learned the meaning of the word "soldier."

The difficulties caused by the too bulky portable outfit were adjusted from the chief surgeon's office by the Dental Corps representative on duty there, and this equipment was reduced to make a modified portable outfit, and the emergency kit. This latter was carried on the person of the dental officer and his enlisted dental assistant, and made it possible to take care of emergency cases, even though the dental officer were being employed in medical capacities. In other words, dental service could be rendered with this equipment, without regard to transportation difficulties, and even under combat conditions.

While certain subjects and phases of oral surgical prosthesis constituted a part of the school curriculum, the dental section of the Army Sanitary School never was primarily a school for oral surgery. Nevertheless, efforts were made to bring the best methods in plastic and prosthetic restorations before the student officers.

CURRICULUM

During the life of the dental section of the Army Sanitary School (December 10, 1917, to December 10, 1918) 16 courses of instruction were given, and certificates were awarded to 320 officers of the Dental Corps. The succeeding pages contain outlines of programs of typical courses of instruction together with a summary of the courses and a detailed consideration of the purposes of the subjects included.

Classification of the subject matter:

I. Military discipline.

- a.* Setting-up exercises.
- b.* Drill.

II. Military administration.

- a.* Army Regulations.
- b.* General orders and bulletins.
- c.* Manual for Courts-Martial.
- d.* Military Law.
- e.* Manual for the Medical Department.
 - 1. Dental records and reports.
 - 2. Dental supplies.
 - 3. Dental requisitions.
 - 4. Medical records and hospital administration.
- f.* The problem of medical supplies in American Expeditionary Forces.

III. Professional.

a. Dental.

1. The organization of the Army Dental Corps.
2. New methods of operative practice (Howe treatment).
3. Conducting a general Army practice.
4. Local and conductive anesthesia.
5. Oral surgery.
6. Oral surgical prosthesis.
7. Oral manifestations of systemic diseases.
8. Special prosthetic appliances.

b. Medical.

1. General anesthesia.
2. The Thomas splint.
3. First-aid bandaging, dressing, and splinting.
4. War surgery.
5. Internal medicine.
6. Surgical technique.

IV. General field service problems.

- a.* Sanitary tactics.
- b.* Field sanitation.
- c.* General and personal hygiene.
- d.* Map reading and field sketching.
- e.* Map problems and terrain exercises.
- f.* Sanitary appliances.
- g.* Evacuation of the wounded.
- h.* Field transportation.

MILITARY DISCIPLINE

Had it been possible to plan for a longer school course, greater emphasis would have been laid upon military training, but under the program or the time allotted for the instruction of each class (two weeks) it was practicable to give it only an hour each afternoon and about 20 minutes early each morning. The dental officer had served as an integral part of combat troops. It was consequently the obligation of the school to give this training. Only the most elementary instruction in Infantry drill was attempted. The sole intention was to give the dental officers the foundation upon which they could build their own military success.

MILITARY ADMINISTRATION

It was contemplated, when the program of the school was modified to include the more practical instruction in field service problems, and that subjects incident to dental administration would be handled by the divisions and the different sections of the Services of Supply. For various reasons, however, the plan never worked out with any uniformity. Army Regulations, Manual for Courts-Martial, and Military Law, and certain subjects of dental adminis-

tration were eliminated as a part of the school course. These subjects were regarded as being important and it was the intention of the director of the dental section to present as much of this instruction as regulations governing the policy of the school would permit, but they were subordinate to the practical problems of combat service.

PROFESSIONAL INSTRUCTION

For the most part subjects classified above as "dental" were taught by officers of the Dental Corps. During the sixteenth session, however, one lecture on the corelationship between the otorhinolaryngologist and the dentist was added to the curriculum. In the associated subjects of oral surgery and oral surgical prosthesis, a medical and a dental officer of the French Army furnished valuable aid. Furthermore, the maxillofacial department, under the chief medical consultant, furnished one lecture during each session.

The subjects classified as medical were taught by the medical officers of the Army Sanitary School and by the staff of consultants called upon as special lecturers.

GENERAL FIELD SERVICE PROBLEMS

Explanation has been made of the change of policy, which expanded the instruction in the more practical subjects of field service, but the real basis for the most efficient field service school was laid just as the armistice was signed. Reference to the subjects taught under this heading demonstrates the completeness of this instruction.

PROGRAM FIRST SESSION (DECEMBER 10 TO 17, 1917)

Monday, Dec. 10:

- 7.45 to 9.45 a. m. --- Dental administration, records, requisitions, reports, and returns.
- 9.45 to 11.45 a. m. --- Regimental and battalion aid stations, field hospitals, medical administration, records, and reports.
- 1 to 2 p. m. --- First aid to the wounded.
- 2 to 3 p. m. --- Dental surgery at the front. Sterilization of dental instruments, and methods employed in the field.
- 3 to 4.30 p. m. --- First-aid bandaging and dressing. Practical instruction and demonstration.

Tuesday, Dec. 11:

- 7.15 to 8 a. m. --- Clinic at sick call.
- 9 to 10 a. m. --- Military discipline, property accountability, personal and efficiency reports, and official correspondence.
- 10 to 11.45 a. m. --- Bandaging and splinting.
- 1.30 to 4.30 p. m. --- Gas instruction.
Lecture—gas warfare, materials used, methods of use.
Practical—fitting and drill with respirator and mask.
Lecture—proper inspection of the respirators and masks.
Gas officers.

Wednesday, Dec. 12:

- 7.45 to 10 a. m. --- Oral surgery and oral surgical prosthesis. The work of the dental surgeon at a base hospital, showing the treatment of individual cases.
- 10 to 11.45 a. m. --- Practical instruction in bandaging and splinting. Students required to employ the various methods and appliances described.

- 1.30 to 3 p. m.----- Gas instruction.
 Lecture—wind observations, gas alert, gas alarms.
 Practical—drills, respirators and masks.
 Lecture—gas poisoning and treatment.
 Gas officers.

Thursday, Dec. 13:

- 7.45 to 11.45 a. m.--- Oral surgery and special oral surgical prosthesis (continued).
 1.30 to 3.30 p. m.--- Gas instruction.
 Lecture—gas-proof dugouts; description and use.
 Practical—drill and testing of respirators and masks in lacry-matory gas.
 Lecture—treatment of gassed patients; discussion and questions answered.
 Gas officers.

Friday, Dec. 14:

- 7.45 to 11.45 a. m.--- Wounds of the jaw, first-aid to jaw cases, surgery and dressings.
 1.30 to 2.30 p. m.--- Oral manifestations of systemic diseases.
 2.30 to 4.30 p. m.--- General and special orders. Army Regulations.

Saturday, Dec. 15:

- 7.45 to 10.45 a. m.--- Local anesthesia, instruments and materials, their care and use; technique of producing local anesthesia of mouth and tissues of the face.
 10.45 to 11.45 a. m.--- The interrelation of the dental and oral surgeon with the general surgeon (plastic), nose and throat surgeon. Special plastic surgery.
 1.30 to 2.30 p. m.--- Manual for Courts-Martial, Military Law.
 2.30 to 4.30 p. m.--- Oral hygiene as applied to uninjured and injured mouths.

Monday, Dec. 17:

- 7.45 to 9.30 a. m.--- General anesthesia—ether, nitrous oxide, nitrous oxide and oxygen.
 9.30 to 10.30 a. m.--- Trench mouth. Relation of oral diseases to systemic infections. Relation of oral surgery to otology, rhinology, laryngology.
 10.30 to 11.45 a. m.--- General and personal hygiene.
 1.30 to 2.30 p. m.--- Customs of the service.
 2.30 to 4.30 p. m.--- Duties of dental surgeons; conducting of general Army dental office. Methods of handling patients.

EXPANSION OF COURSE

The fourth session (February 2 to 17, 1918), was marked by some radical changes in the program of instruction. The important provisions of Army Regulations were considered more in detail than had been the case in the preceding sessions, and an officer of the Judge Advocate General's Department was detailed as an instructor in the Manual for Courts-Martial and Military Law. Furthermore, a lecture on map and compass reading was added to the program. This was the extent of the expansion in the lecture subjects.

It had been noted among various combat organizations that dental officers were used to command men in time of emergency, and were relieving medical officers, at times, of their military duties; this was caused partly by the insufficiency of the quota of medical officers during times of combat and partly by the fact, which became increasingly evident during later developments, that dental equipment, as constituted, could not be transported and used efficiently in combat areas. With a view to making the dental officers as conversant as possible with matters of military discipline and with Infantry drill, the commandant of Army schools detailed an officer of the Cavalry, United States

Army, to drill the student officers for one hour each day. This instruction continued to be a part of the school course until its close.

Up to the commencement of the fourth session six lectures of one hour each had been given each day. With the initiation of the training in drill the lecture hours were reduced to five, the hour for drill instruction occupying the sixth period.

During the period from the fourth to the seventh sessions an attempt was made to combine field service and practical instructions for combat conditions with the more detailed training in military administration and discipline. This plan was successful, but only for the reason that the problem of the training of dental officers to function properly in times of battle was not sufficiently understood to enable the school to give a comprehensive course concerning it. Furthermore, it was expected that many of the dental officers who seemed especially fitted would be employed in the special work of oral surgery. This theory was later found to be a mistaken one, for the demand for men who could do routine dentistry was so great that this special work was assigned to other fields, and the dental officer, not only in combat divisions but throughout France, was employed, for the most part, when he did dental work at all, in the practice of the routine methods of his profession.

FOURTH SESSION

Monday, Feb. 4, 1918:

- | | |
|---------------------------|---|
| 8.30 to 9.30 a. m. | Opening lecture. Scope of dento-military instruction; responsibility as officers; conduct during course. |
| 9.40 to 10.40 a. m. | The work of a dental surgeon at a base hospital. Organization of the unit to care for personnel and patients. Equipment in instruments, materials, and men. |
| 10.50 to 11.45 a. m. | Practical instruction in first aid; precautions against hemorrhage and shock. |
| 1.30 to 2.30 p. m. | Dental administration; Manual for the Medical Department. |
| 2.45 to 3.45 p. m. | Antitetanic injections; care of wounds of the face and neck associated with fractures of the maxillæ and mandible. |

Tuesday, Feb. 5:

- | | |
|---------------------------|--|
| 8.30 to 9.30 a. m. | The Army Dental Corps; organization; status; duties. |
| 9.40 to 10.40 a. m. | Treatment of fractured jaws; vertical and longitudinal fractures of the maxillæ. |
| 10.45 to 11.45 a. m. | First aid to the wounded; latest methods of handling fractures in the field. |
| 1.15 to 4.30 p. m. | Gas course; gas warfare, methods and use; drills, respirator, and mask. |

Wednesday, Feb. 6:

- | | |
|---------------------------|--|
| 8.30 to 9.30 a. m. | Treatment of fractured jaws; fractures of the maxillæ with little or no loss of substance. |
| 9.40 to 10.40 a. m. | Supplies and materials; requisitions; Manual for the Medical Department (continued). |
| 10.50 to 11.45 a. m. | Practical instruction in first-aid bandaging and dressing. |
| 1.15 to 4.30 p. m. | Gas course; wind observations; gas alerts and gas alarms; gas poisoning and treatment. |

Thursday, Feb. 7:

- | | |
|--------------------------|---|
| 8.30 to 9.30 a. m. | Transfer of supplies; vouchers and receipts; Manual for the Medical Department (continued). |
| 9.40 to 10.40 a. m. | Treatment of fractured jaws; compound, comminuted fractures with loss of substance. |

Thursday, Feb. 7—Continued.

- 10.50 to 11.45 a. m. ----- Practical instruction in first-aid bandaging and dressing, the students being required to apply various methods and materials shown.
- 1.15 to 4.30 p. m. ----- Gas course; gas-proof dugouts, description and use. Testing of respirators with lacrymatory gas. Questions and discussions.

Friday, Feb. 8:

- 8.30 to 9.30 a. m. ----- Army Regulations.
- 9.40 to 10.40 a. m. ----- Treatment of fractured jaws; compound comminuted fractures of the symphysis of the mandible.
- 10.50 to 11.45 a. m. ----- Practical instruction in first-aid bandaging and dressing.
- 1.30 to 2.30 p. m. ----- Map and compass reading.
- 2.45 to 3.45 p. m. ----- Military discipline and customs of the service.
- 3.45 to 4.30 p. m. ----- Drill.

Saturday, Feb. 9:

- 8.30 to 9.30 a. m. ----- Local anesthesia; advantages over general anesthesia; instruments necessary for producing.
- 9.40 to 10.40 a. m. ----- Property responsibility and accountability.
- 10.50 to 11.45 a. m. ----- Practical instruction in first aid.
- 1.30 to 2.30 p. m. ----- Local anesthesia, subject completed; Ottesen method (intra-osseous); anesthesia of soft parts of face for plastic operations.
- 2.45 to 3.45 p. m. ----- Regimental and battalion aid stations; field hospitals; the battalion and regimental surgeon in trench warfare.
- 3.45 to 4.30 p. m. ----- Drill.

Monday, Feb. 11:

- 8.30 to 9.30 a. m. ----- Forms of the Medical Department.
- 9.40 to 10.40 a. m. ----- Oral surgery in connection with the general surgeon.
- 10.50 to 11.45 a. m. ----- Army Regulations (continued).
- 1.30 to 2.30 p. m. ----- Army Regulations.
- 2.45 to 3.45 p. m. ----- Medical Department in the zone of the advance.
- 3.45 to 4.45 p. m. ----- Drill.

Tuesday, Feb. 12:

- 8.30 to 9.30 a. m. ----- Army Regulations.
- 9.40 to 10.40 a. m. ----- General anesthesia.
- 10.50 to 11.45 a. m. ----- Forms of the Medical Department (continued).
- 1.30 to 2.30 p. m. ----- General anesthesia; operating-room technique.
- 2.45 to 3.45 p. m. ----- Diseases and casualties of war.
- 3.45 to 4.45 p. m. ----- Drill.

Wednesday, Feb. 13:

- 8.30 to 9.30 a. m. ----- Plastic operations of head and neck; removal of foreign bodies.
- 9.40 to 10.40 a. m. ----- Responsibility and accountability, additional facts.
- 10.50 to 11.50 a. m. ----- Army Regulations.
- 1.30 to 2.30 p. m. ----- Manual for Courts-Martial and Military Law.
- 2.45 to 3.45 p. m. ----- General and personal hygiene.
- 3.45 to 4.30 p. m. ----- Drill.

Thursday, Feb. 14:

- 8.30 to 9.30 a. m. ----- Military correspondence.
- 9.40 to 10.40 a. m. ----- Oral hygiene as applied to both injured and uninjured mouths.
- 10.50 to 11.45 a. m. ----- Army Regulations.
- 1.30 to 2.30 p. m. ----- General anesthesia; operating-room technique.
- 2.45 to 3.45 p. m. ----- Relation of oral disease to systemic infections.
- 3.45 to 4.30 p. m. ----- Drill.

Friday, Feb. 15:

8.30 to 9.30 a. m.	Conducting a general army practice.
9.40 to 10.40 a. m.	Dental surgery at the front; dental sterilization in the field.
10.50 to 11.50 a. m.	Oral manifestations of systemic diseases.
1.30 to 2.30 p. m.	Manual Courts-Martial and Military Law.
2.45 to 3.45 p. m.	A study of the causes of displacement following fractures of the mandible.
3.45 to 4.45 p. m.	Drill.

Saturday, Feb. 16:

8.30 to 9.30 a. m.	Charge to the class.
9.45 to 12 m.	Examinations.
1 to 3.30 p. m.	Examinations.
4 to 5 p. m.	Lecture.

CLINICAL DEMONSTRATIONS

The school had been in operation until May before it was possible to secure any clinical material for instruction purposes. One of the disadvantages of a training institution located in such a town and locality as Langres was that clinical material was not easily available, and what little there was could be drawn only with great difficulty from the few French hospital formations located in the vicinity. But with the occupation of Camp Hospital No. 24 by an American unit, the opportunity arose for the use of the clinical demonstrations for the student officers.

The first of these clinics, which were held continuously after that time, was in charge of an officer of the Dental Corps attached to the hospital, who, during the seventh session, gave two clinical demonstrations of local and conductive anesthesia at Camp Hospital No. 24. In addition to this, two lectures were arranged for, to be given by an officer of the Medical Corps, on surgical technique and minor surgery, and this work was soon supplemented by a lecture on general anesthesia by another officer of the Medical Corps who, after that time, gave many demonstrations before the class at Camp Hospital No. 24.

The growth of the information which was contained in the orders and bulletins of the American Expeditionary Forces necessitated the giving of a lecture on these regulations, and this instruction, as it was intimately associated with the problems which were constantly arising in the field, formed a part of the course of instruction.

As a supplement to the training which was being given in Infantry drill, morning setting-up exercises were initiated, under the direction of a Cavalry officer.

During the first week in June the faculty of the dental section spent several days in studying the work of the French maxillofacial surgeons at Hospital No. 45 at Vichy. It was here that the idea of the cast splint for cases of jaw fracture was being worked out efficiently, and much information toward the improvement of the maxillofacial work in our own service was gained. This trip to Vichy formed the basis for a series of lectures which were given later before the dental and medical classes by the chief of service of Hospital No. 45, and who succeeded in arranging a scheme for collaboration between the French and American oral surgeons in the hospitals at Vichy.

Friday, Apr. 19:

6.30 to 7 a. m.	Setting-up exercises and drill.
8.30 to 9.30 a. m.	Opening lecture: (a) Scope of dento-military instruction—responsibilities as officers; (b) conduct—(1) discipline, (2) requirements during school term.
9.40 to 10.40 a. m.	The work of the dental surgeon in a base hospital; organization to care for large personnel and many patients.
10.50 to 11.45 a. m.	Military discipline and customs of the service.
1.30 to 2.30 p. m.	Antitetanus injections; care of wounds of the face and neck associated with fractures of the maxillæ or mandible.
2.45 to 3.45 p. m.	Hospital administration; Manual for the Medical Department. Medical records and hospital administration.
3.45 to 4.30 p. m.	Drill.

6.30 to 7 a. m.	Setting-up exercises and drill.
8.30 to 9.30 a. m.	Dental supplies and materials, requisitions, transfers, vouchers, receipts.
9.40 to 10.40 a. m.	Treatment of fractured jaws; vertical and longitudinal fractures of the maxillæ.
10.50 to 11.45 a. m.	The Army Dental Corps; organization, history, status, duties.
1.30 to 2.30 p. m.	Practical instruction in first aid, hemorrhage and shock, tetanus, nutrition.
2.45 to 3.45 p. m.	Regimental and battalion aid stations; field hospitals; the battalion and regimental surgeons in trench warfare.
3.45 to 4.30 p. m.	Drill.

9.30 to 11.30 a. m.----- Clinic (conductive anesthesia and extraction), Camp Hospital No. 24.

6.30 to 7 a. m.	Setting-up exercises and drill.
8.30 to 9.30 a. m.	Property accountability and responsibility; relief from accountability in the zone of the advance.
9.40 to 10.40 a. m.	Treatment of fractured jaws; fractures of the maxillæ with little loss of substance.
10.50 to 11.45 a. m.	Army regulations; American Expeditionary Forces orders and bulletins.
1.30 to 4.30 p. m.	Gas instructions. Lecture—gas warfare, materials used and methods of use. Practical—fitting and drill with respirator and mask. Lecture—inspection of respirators and masks.

6.30 to 7 a. m.-----	Setting-up exercises and drill.
8.30 to 9.30 a. m.-----	Army Regulations; American Expeditionary Forces orders and bulletins.
9.40 to 10.40 a. m.-----	New forms and regulations for the Medical Department in American Expeditionary Forces; medical section; salvage service.
10.50 to 11.45 a. m.-----	Treatment of fractured jaws: compound, comminuted fractures with loss of substance.
1.30 to 4.30 p. m.-----	Gas instruction. Lecture—wind observations, gas alerts, and gas alarms. Practical—drills, respirators, and masks. Lecture—gas poisoning and treatment.

Wednesday, Apr. 24:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8.30 to 9.30 a. m.----- Treatment of fractured jaws; compound, comminuted fractures of the mandible.
 9.40 to 10.40 a. m.----- Special dressings and splints; demonstration of the Thomas splint.
 10.50 to 11.45 a. m.----- Army Regulations; American Expeditionary Forces orders and bulletins.
 1.30 to 4.30 p. m.----- Gas instruction.
 Lecture—gas-proof dugouts; description and use.
 Practical—drill and testing of respirators and masks with lacrymatory gas.
 Lecture—treatment of gassed patients; discussions and remarks.

Thursday, Apr. 25:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8.30 to 9.30 a. m.----- Local anesthesia.
 9.40 to 10.40 a. m.----- Dental records and reports, methods of rendering in the American Expeditionary Forces.
 10.50 to 11.45 a. m.----- Local anesthesia (continued).
 1.30 to 2.30 p. m.----- Army Regulations.
 2.45 to 3.45 p. m.----- Dental records and reports (continued).
 3.45 to 4.30 p. m.----- Drill.

Friday, Apr. 26:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8.30 to 9.30 a. m.----- Oral surgery in connection with the general surgeon.
 9.40 to 10.40 a. m.----- Army Regulations.
 10.50 to 11.45 a. m.----- Military forms and correspondence.
 1.30 to 2.30 p. m.----- Plastic operations of the face; removal of foreign bodies from the head and neck.
 2.45 to 3.45 p. m.----- General and personal hygiene.
 3.45 to 4.30 p. m.----- Drill.

Saturday, Apr. 27:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8.30 to 9.30 a. m.----- General anesthesia.
 9.40 to 10.40 a. m.----- Methods of handling wounds and fractures in the field, where medical supplies are limited.
 10.50 to 11.45 a. m.----- General anesthesia (continued).
 1.30 to 2.30 p. m.----- Practical instruction in first-aid bandaging and splinting.
 2.45 to 3.45 p. m.----- Surgical technique and assisting at operations.
 3.45 to 4.30 p. m.----- Drill.

Sunday, Apr. 28:

- 9.30 to 11.30 a. m.----- Clinic: Conductive anesthesia and extraction.

Monday, Apr. 29:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8.30 to 9.30 a. m.----- Military correspondence completed.
 9.40 to 10.40 a. m.----- Relation of oral diseases to systemic infections.
 10.50 to 11.45 a. m.----- Diseases and casualties of war.
 1.30 to 2.30 p. m.----- First-aid bandaging and dressing.
 2.45 to 3.45 p. m.----- Oral manifestations of systemic diseases.
 3.45 to 4.30 p. m.----- Drill.

Tuesday, Apr. 30:

- 6.30 to 7 a. m.----- Setting-up exercises and drill.
 8 to 9.30 a. m.----- Clinic (depressive craniotomy), at Camp Hospital No. 24.
 9.40 to 10.40 a. m.----- Military correspondence, subject completed.
 10.50 to 11.45 a. m.----- Frequency of mouth cleaning in cases of severe injuries.
 1.30 to 2.30 p. m.----- Manual for Courts-Martial and Military Law.
 2.45 to 3.45 p. m.----- Instruction in first aid, bandaging and dressing.
 3.45 to 4.30 p. m.----- Drill.

Wednesday, May 1:

6.30 to 7 a. m.-----	Setting-up exercises and drill.
8.30 to 9.30 a. m.-----	Oral manifestations of systemic diseases, completed.
9.40 to 10.40 a. m.-----	Military forms and correspondence.
10.50 to 11.45 a. m.-----	Oral hygiene, discussion at length.
1.30 to 2.30 p. m.-----	Manual for Courts-Martial and Military Law.
2.45 to 3.45 p. m.-----	Oral hygiene as applied to injured and uninjured mouths.
3.45 to 4.30 p. m.-----	Drill.

Thursday, May 2:

6.30 to 7 a. m.-----	Setting-up exercises and drill.
8.30 to 9.30 a. m.-----	Further remarks on general anesthesia.
9.40 to 10.40 a. m.-----	Methods of conducting an office practice.
10.50 to 11.45 a. m.-----	Charge to the class.
1.30 to 2.30 p. m.-----	Application of the Dental Corps to the zone of advance.
2.45 to 3.45 p. m.-----	Concluding remarks on oral hygiene and general anesthesia.

Friday, May 3:

9 a. m. to 3 p. m.-----	Completion of theses; oral examinations.
-------------------------	--

MEDICAL INSTRUCTION FOR THE DENTAL CORPS

Reference to the programs which outline the policy of the dental section previous to July, 1918, will reveal the fact that development toward a practical field-service course had taken place, but that this development had been slow. With the seventh session, clinical instruction had been made possible. Soon after this it was possible to glean accurate information from the dental officers in divisions concerning just what their difficulties were, together with some suggestions as to the most efficient methods of solution.

With a view for amplifying the training which had already been given the student officers of the dental section, the commandant of the Army Sanitary School made the following recommendations in a letter:

ARMY SANITARY SCHOOL, ARMY SCHOOLS,
AMERICAN EXPEDITIONARY FORCES,
France, June 26, 1918.

From: The commandant, Army Sanitary School.

To: The chief surgeon, S. O. S., American Expeditionary Forces (through commandant, Army Schools).

Subject: Medical instruction of Dental Corps.

1. It is being constantly reported to the commandant of the Army Sanitary School that dental officers are being employed to do the work of medical officers not only in the back areas but in those at the front, such as battalion aid stations.

2. In order to meet the demands for knowledge of duties they would be required to perform in first-aid and in emergency, the commandant of the Army Sanitary School has provided instructors for the dental section of this school to give them an elementary knowledge of such first aid work and of the relative positions of medical units on the battle field and their functions as they might be called upon to perform in emergency.

3. As will be seen from the appended program now being followed, the following is the distribution of the time allotted to the class of the dental section:

	Hours
(a) Dental hygiene, dental diseases, and injuries affecting the practice of stomatology.....	15
(b) Anesthesia, local and general	5
(c) General instruction in gas protection and treatment of the gassed	9
(d) Purely military subjects	4
(e) Drills and setting-up exercises	13
(f) Purely medical subjects	12
(g) Administration, general knowledge of regulations, including property accountability and regulations of the Medical Department	17
Total	75

4. As this gives only 20 per cent of the time to the purely professional side of the Dental Corps and provides no opportunity, save one hour, for clinics and demonstrations on professional subjects, it is recommended that the previous recommendation some months back, to the effect that some practical demonstrations be given these officers, should be provided in the future by a tour of instruction for the purposes of practical demonstrations to the Franco-American dental center now being formed at Vichy, the division of time of the class being as follows: One week of didactic instruction in the school area and one week of practical demonstrations at Vichy.

5. That division surgeons be instructed to provide for their dental surgeons all necessary instruction in the paper work of the Army, drill and first aid, in order to thus reduce to a minimum this elementary instruction at a center like this, which should devote its time to the teaching of those things which can not be learned in a division. Inasmuch as such instruction in first aid, bandaging, etc., should be limited to that knowledge which should be possessed by all branches of the Medical Corps, it is believed that the proper person to be made responsible for such instruction should be the division surgeon and not a school devoted to the higher branches of professional work. Such instruction can be given, as it has been given for the last six months, but always at the expense of things which can not be obtained in a division and by duplication of the work of our own faculty, inasmuch as the lectures given our medical officers are too technical to be used by the dental surgeons, who, by the way, have but one-third of the time given our medical officers for instruction at this school.

6. The recommendation herein does not intend to exclude intervention of medical officers at this school in those special and necessary presentations of phases of first-aid work which they can best give; in fact, the commandant of this school desires to have at least three or four periods at his disposal for the presentation of such medical subjects; but the intention of this letter is to try to have defined the principles underlying dental instruction at this center and have time which is today taken for elementary training in military and medical subjects provided for by division surgeons, under the general head of training, instruction which can never bear fruit unless such training is continued over a period far in excess of the time which it is possible to allot to these subjects at this center, and the dental school here will be enabled to divert its energies to more important subjects and to instruction which could not be given in the division.

(Signed) BAILEY K. ASHFORD,
Colonel, Medical Corps, United States Army,
Commandant.

The results of this recommendation were later made evident in the publication of the policy of the Training Section of the General Staff concerning the dental section in the following letter:

GENERAL HEADQUARTERS,
AMERICAN EXPEDITIONARY FORCES,
France, July 20, 1918.

Memorandum for commandant, Army Schools, A. E. F.

Subject: Program of instruction, dental section, Army Sanitary School.

Examination of the program of instruction of the dental section of the Army Sanitary School and correspondence relating thereto leads to the following conclusions:

(1) The purpose of this school is to give dental surgeons attached to combat divisions or the Services of Supply instruction in preparation for field service in the American Expeditionary Forces which will supplement that given in the training camps in the United States and with troops in France.

(2) General first-aid instruction is required for all sanitary troops in divisions in France, and is given in training camps in the United States.

(3) Instruction in military law, customs of the service, Army Regulations, and general instruction in military correspondence and reports and returns is given in divisions and training camps in the United States.

(4) In view of the fact that the course for dental surgeons is short and instruction in the subject is available elsewhere, it is desired that instruction in first aid, except as it relates

to oral or dental wounds or accidents, military law, customs of the service, military correspondence, Army Regulations and reports and returns (except as changed by the American Expeditionary Forces), be discontinued in the dental section of the Army Sanitary School and the time secured used for instruction in other subjects relating to field duties of dental surgeons.

(5) There is no immediate probability of the establishment of a special-course center of oral surgery near the site of the Army Sanitary School, and until such a center is established visits of instruction for student officers of the dental section are deemed impracticable.

(Signed) H. B. FISKE,
Brigadier General, General, Staff,
Acting Chief of Staff, G-5.

FIELD SERVICE SCHOOL

It had been the aim of the director of the dental section for several months to present a course of instruction to the dental officers which would embody both the principles of dental service in the field and the consideration of the multifold auxiliary medical duties which become a part of the life of the dental officer during combat. For numerous reasons, this plan had not been practical up to October, 1918. But with the initiation of the plans for the program of the fifteenth session of the dental section of this school, a plan was considered jointly with the director of the Army Sanitary School, which contemplated the holding of 14 joint lectures of dental and medical officers, embodying practically all the essential points of medical duties and sanitary tactics which had been proven to be very important for the dental officer.

A study of the program for the fifteenth session will demonstrate the carrying out of this plan. In the first place, in order to give the dental officer some conception of the organization of the machine of which he was a part, one lecture on the organization of the entire American Expeditionary Forces was presented, and also a lecture on the organization of the Medical Department. This gave the dental officer an idea of the workings of the different sections of the general staff, of the functionings of the Services of Supply, and of the coordination of the Medical Department plans with those of the line organizations in a combat division.

Furthermore, in addition to theoretical instruction in sanitary tactics, one afternoon was devoted to practical terrain exercises, in charge of an officer who was a graduate of the General Staff College, and who had studied the divisional problem from every side.

The previous 14 sessions had contained as part of the course the preparation of a notebook, which held the different lectures in the form in which they were given. This notebook had been corrected, and was later returned to the student officer, but not until the book had been carefully studied, and the gradings given by the faculty entered upon the student's record, and made part of the official report which was made concerning him.

This notebook was a complete résumé of the student's work while at the school. But this did not give any conception of the difficulties which this man might have encountered or any questions which might have come up in his mind which it was the business of the school to answer. To the end of finding out just what problems and difficulties the student officers were confronted with, a thesis was required of each student, to be written during the first week he was at the school. This was short, 500 to 800 words, and the arrangement of the

titles was such that the student could choose the one which applied particularly to his case. For instance, there were such titles as the following: "The dental officer on duty with a division"; "The dental officer with field, evacuation, or mobile hospitals"; "The dental officer with base hospitals"; "The dental officer with detached organizations."

This thesis considered the difficulties of dental treatment, the problems of transportation, suggestions for the improvement of the particular branch of the service with which he might be connected, and furnished the faculty with the definite basis for some of their more important instruction, and gave them the opportunity of clearing up in the minds of the student officers certain of the difficulties with which they had been confronted.

After the beginning of the fifteenth session an effort was made to carry out the instruction along the lines of practical field service, with a view to helping the man with the division, who needed aid the most, and making the base hospital problem subsidiary to the larger question.

FIFTEENTH SESSION

First day:

7.20 to 7.40 a. m.	Setting-up exercises.
8.30 to 9 a. m.	Opening lecture.
9 to 10.30 a. m.	Opening remarks.
10.30 a. m. to 12 m.	Organization of the American Expeditionary Forces.
1.30 to 3 p. m.	Organization of the surgical services, American Expeditionary Forces.
3 to 4.30 p. m.	Mental hygiene.
4.30 to 5.15 p. m.	Drill.

Second day:

7.20 to 7.40 a. m.	Setting-up exercises.
8.30 to 9.30 a. m.	General orders and bulletins.
9.40 to 10.40 a. m.	The work of a dental surgeon at a base hospital.
10.50 to 11.50 a. m.	The Army Dental Corps.
1.30 to 2.30 p. m.	Fractures of the maxillæ and mandible, general considerations. Treatment of fractures of the maxillæ illustrated by records.
3 to 4.30 p. m.	Map reading.
4.30 to 5.15 p. m.	Drill.

Third day:

7.20 to 7.40 a. m.	Setting-up exercises.
8.30 to 9.30 a. m.	General orders and bulletins.
9.40 to 10.40 a. m.	Treatment of fractures of maxillæ with slight loss of substance.
10.50 a. m. to 12 m.	Map reading.
1.30 to 3 p. m.	Histopathology of war wounds.
3.30 to 4.30 p. m.	Treatment of fractures of mandible with large loss of substance.
4.30 to 5.15 p. m.	Drill.
8.30 to 10 p. m.	Shock.

Fourth day:

7.20 to 7.40 a. m.	Setting-up exercises.
8.15 to 9.15 a. m.	Hospital organization.
9.20 to 10.20 a. m.	Diseases of the oral cavity.
10.30 a. m. to 12 m.	Organization of the Medical Department.
1.30 to 3 p. m.	Organization of the Medical Department.
3 to 4.30 p. m.	General anesthesia.
4.30 to 5.15 p. m.	Drill.

Fifth day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 a. m. to 4.30 p. m. . . . Gas instruction (by gas officers in lecture room and gas chambers).

Sixth day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 a. m. to 4.30 p. m. . . . Gas instruction (by gas officers in lecture room and gas chambers).

Seventh day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 7.55 to 8.30 a. m. Clinic, Camp Hospital No. 24 (general anesthesia).
 8.30 to 9.30 a. m. Evacuation of the wounded.
 9.40 to 10.40 a. m. The regimental and battalion surgeon and battalion aid station in trench warfare.
 10.50 to 11.50 a. m. Oral manifestations of systemic diseases.
 1.30 to 2.30 p. m. Treatment of hemorrhage in connection with fractures and associated wounds.
 2.40 to 3.40 p. m. Sterilization and surgical cleanliness.
 3.50 to 4.50 p. m. Duties of the evacuation officer of an army.

Eight day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 to 9.30 a. m. Special dressings and splints.
 9.40 to 10.40 a. m. Medical records and hospital administration.
 10.50 to 11.50 a. m. Local anesthesia; consideration of the instruments and drugs.
 1.30 to 2.30 p. m. Operative technique; minor surgery.
 2.45 to 3.45 p. m. Methods of producing local anesthesia.
 3.45 to 4.30 p. m. Drill.

Ninth day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 to 9.30 a. m. Special dressings and splints.
 9.40 to 10.40 a. m. Reserve and front line sanitation.
 10.50 to 11.50 a. m. Oral hygiene as applied to uninjured mouths.
 1.30 to 2.30 p. m. Administration of dental department.
 2.45 to 3.45 p. m. Conducting a general army practice; base hospital and service of supplies.
 3.45 to 4.45 p. m. Conducting a general army practice.

Tenth day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 to 9.30 a. m. The regimental and battalion surgeon in the rest areas.
 9.40 to 10.40 a. m. Character of professional services in combat areas.
 10.50 to 11.45 a. m. Cooperation of the dental surgeon with the maxillofacial department; divisional dental surgeons; dental surgeons at field and evacuation hospitals.
 1.30 to 2.30 p. m. Problems of the battalion surgeon in war.
 2.45 to 3.45 p. m. Recent development in operative procedure as applied to army practice.
 3.45 to 4.30 p. m. Drill.

Eleventh day:

- 7.20 to 7.40 a. m. Setting-up exercises.
 8.30 to 9.30 a. m. The Thomas splint.
 9.40 to 10.40 a. m. Technique of facial plastic operations.
 10.50 to 11.50 a. m. Field sketching.
 1.30 to 2.30 p. m. Dental records and reports.
 2.45 to 3.45 p. m. Oral hygiene as applied to uninjured mouths.
 3.45 to 4.30 p. m. Drill.

Twelfth day:

- 7.20 to 7.40 a. m. ----- Setting-up exercises.
- 8.30 to 9.30 a. m. ----- Evacuation of wounded in war of movement.
- 9.40 to 10.40 a. m. ----- Anesthesia by nitrous oxide, and nitrous oxide and oxygen.
- 10.50 to 11.50 a. m. ----- The aluminum plate.
- 1.30 to 4.45 p. m. ----- Examinations.

Two clinics on conductive anesthesia, of two hours each, were held at Camp Hospital No. 24, on October 20 and 27.

Sunday afternoon, October 27, the class was given instruction in map problems.

The Army Sanitary School was closed December 31, 1918.²

CHAPTER XI

COLLEGE OF MEDICAL SCIENCES,^a AMERICAN EXPEDITIONARY FORCES UNIVERSITY, BEAUNE, COTE D'OR, FRANCE

The American Expeditionary Forces University, of which the College of Medical Sciences was a department, was organized and operated under the control of the fifth section of the general staff, general headquarters, which section controlled all educational work in the American Expeditionary Forces.¹ The general plan of the university was formed in January, 1919, by the general staff officer in charge of educational subsection, G-5, and the Army educational commission of the Young Men's Christian Association. On February 8, 1919, Beaune was definitely selected as the site of the university, and work was immediately begun to organize the faculty and courses, and to plan for equipment. In February authority was issued for the establishment of the American Expeditionary Forces University, including, in the following words, the medical and other technical departments: ²

4. Since the above university opportunities are of graduate character and are therefore available only to selected men of high educational qualifications, an American Expeditionary Forces educational center will be established to provide college and technical training beyond that offered at division educational centers. Students will enroll for a period of three months. Detailed instructions for the assignment of members of the American Expeditionary Forces to this educational center will be issued from these headquarters.

The College of Medical Sciences included departments of medicine, dentistry, veterinary medicine, and pharmacy, each having a director and a corps of instructors.¹

The requirements for admission were the same as those of class A schools of corresponding character in the United States. The undergraduate courses were designed to aid the student in preparing to return to his respective school for completion of his course under the most favorable circumstances and within the shortest possible time. To this end a schedule for a complete four-year course was drawn up for each of the professional departments (medicine, dentistry, and veterinary medicine). Students who preferred to do intensive work for three months in one or two subjects, instead of securing the advantage of the three months' training in all the courses offered in the curriculum for the year to which they were eligible, were given such opportunity.

Post-graduate courses were arranged for men having the degree of doctor of medicine, which were taken in French universities at Lyon, Paris, Marseille, and Bordeaux. A course in laboratory methods and technique for post-graduate work were given at the central Medical Department laboratory at Dijon.

^a Unless otherwise indicated the statements of fact made herein are based on: History of the College of Medical Sciences, A. E. F. University, Beaune (Cote D'Or), France. Copy on file, Historical Division, S. G. O.

The facilities of the school of medical sciences included Camp Hospital No. 107, formerly Base Hospital No. 77, and Camp Hospital No. 108, formerly Base Hospital No. 97; a department of sanitation, including fifteen regimental infirmaries; and a venereal prophylaxis department.

The College of Medical Sciences, together with all the other departments of the university, was closed on June 7, 1919, and all records were turned over to the registrar.

DEPARTMENT OF MEDICINE

The faculty of this department consisted of the director and 17 commissioned assistants, two of the latter being Sanitary Corps officers, one Infantry, and one Signal Corps. The following is an outline of the course:

OUTLINE OF COURSE

ANATOMY

The course in anatomy will include gross anatomy, histology, and embryology. The work in gross anatomy will comprise three hours of didactic work per week for the first-year students. The course will be available for first-year dental students also.

The course in histology will be divided into one hour of didactic instruction and five hours of laboratory work per week. This course will be given to first-year medical, dental, pharmacy, and veterinary students.

The embryology work will include one hour of lecture and two hours of laboratory work per week. A study of human embryo and its envelopes will be taken up. Work on the early stages will be based on the chick.

BACTERIOLOGY

There will be six hours per week, two hours of lecture and four hours of laboratory work.

PATHOLOGY

The course in pathology will consist of two lecture hours and four hours of laboratory work per week.

ORGANIC AND PHYSIOLOGICAL CHEMISTRY

This course will consist of didactic instruction and four hours of laboratory work per week.

PHYSIOLOGY

The course in physiology will include two hours of didactic instruction and three hours of laboratory work. The work will be given to first-year medical, dental, and pharmacy students.

DEPARTMENT OF DENTISTRY

The dental department was organized coincidentally with the department of medicine, and the faculty consisted of the director and 10 commissioned dental officers who, besides instructing the students, were operators in the dental infirmary conducted for the benefit of all the officers and enlisted men at this post. The extent of their work may be realized from the figures that show that from March 10 to March 31, the total number of patients treated was 867 and the number of sittings totaled 1,420.

The following outline shows the subjects covered and the relationship with other departments:

COLLEGE OF DENTISTRY—OUTLINE OF COURSES

Pre dental course.—Inorganic chemistry, qualitative analysis, zoology (given in connection with courses in College of Science).

Course of first-year dental students.—Anatomy, physiology, embryology, bacteriology, histology, physiologic chemistry, organic chemistry (given in connection with courses in first-year medicine in College of Medicine).

Course for dental students.—Dental materia medica and therapeutics, operative technique, prosthetic technique, operative lectures and clinical demonstrations, prosthetic lectures and clinical demonstrations, radiography lectures and clinical demonstrations, oral surgery lectures and clinical demonstrations, local anesthesia lectures and clinical demonstrations (given at dental section of the College of Medicine).

COURSES FOR POSTGRADUATES

Selective courses suitable for graduates in dentistry were arranged in the subjects stated above, instruction being given by lectures and demonstrations.

DEPARTMENT OF VETERINARY MEDICINE

The veterinary department was first organized on a four-year basis, but after considering the lack of opportunity to give clinical instruction and advanced work, it was decided to give only first-year work, and to transfer all students of the second, third, and fourth years and postgraduate students to some foreign institution. The faculty consisted of the director and five commissioned veterinary officers. An outline of the course follows:

VETERINARY DEPARTMENT—OUTLINE OF COURSE

Veterinary physiology.—Physiology will be taught by means of lectures and recitations. The normal functions of the different systems (circulatory, respiratory, etc.), will be presented with due regard to a complete knowledge of the subjects covered. It is anticipated that the knowledge of the course will comply with the standards of veterinary colleges in the United States.

Anatomy (veterinary).—Anatomy will be taught by lectures and practical work in a laboratory, the course consisting of five hours, one hour lecture period and two laboratory periods of two hours each week. The 12 weeks' course has been divided in osteology, covering a period of 5 weeks; arthrology, covering 1 week; and myology, covering 6 weeks.

Pharmacology.—Pharmacology will be taught by a course of lectures consisting of one lecture, one hour a week, for a period of 12 weeks. The course of lectures will cover the following outline: Definition, textbook, nomenclature; pharmaceutical arithmetic; pharmaceutical operations; official preparations.

Preliminary medicine.—Preliminary medicine will consist in a course of lectures of one hour per week for 12 weeks. The course of lectures will cover the following outlines: Fundamental principles of diagnosis, 6 hours; language of medicine, 6 hours.

DEPARTMENT OF PHARMACY

The faculty of the department consisted of 7 commissioned officers, 4 of whom were of the Medical Corps; 2, Infantry; and 1, Sanitary Corps. The requirements for entrance were four years' high school or preparatory work. As given it covered only first-year subjects and included inorganic chemistry, physiology, bacteriology, histology, materia-medica, and pharmacy. Advanced students and those desiring to do postgraduate work were sent to French universities to pursue their studies.

APPENDIX

APPENDIX ^a

ARMY SANITARY SCHOOL, ARMY SCHOOLS, A. E. F., FRANCE

MEMORANDUM PERTAINING TO THE APPENDED LITERATURE OF THE ARMY SANITARY SCHOOL

These documents have been carefully selected from a large number of sources and most have been prepared, translated, or abstracted personally by the staff of the school. The notes on the visit to the English front were written by the commandant from his notes, and supplement made thereto by adding data not embraced therein from the notebook of the 20 student officers forming the class.

No recommendations or résumé of these papers have been made (1) for lack of time to make it complete, and (2) because the notes themselves suggest the necessities for our Army without further burdening an already large collection of papers with additional remarks.

These documents are all confidential and are only for the use of the officers of the Army.

Care has been taken to present therein only such data as have been personally verified, as to their feasibility and correctness, by the staff of the school. An attempt is made to cover all of the essentials in the ordinary duties of the medical services of the Army.

It is believed that after its inspection an effort should be made by all receiving these documents to circulate among the officers, particularly the medical officers, the gist at least of this information, to the end that they may be advised of what is actually going on in the medical services of the French and British Armies.

BAILEY K. ASHFORD,
Colonel, M. C., United States Army,
Commandant.

Army Sanitary School No. 14.

VISIT TO THE TRENCHES—GROUP UNDER COL. BAILEY K. ASHFORD

(Majors Graham, Bryson, Watts, and Rowan)

We left the C. C. S. at 9.25 a. m. in motor ambulances for the division surgeon's office in the sector to be visited.

The type of British ambulance is about the best I have ever seen. It is as large as a van and the body is universal for the medical department. The wheels are of wire and the engines are of divers makes, Buick being preferred. Each carried two Thomas splints, some hot-water bags, and enough blankets for 4 litters, usually 12. It is heated by kerosene, and a speaking trumpet communicates with the driver from within. It is a very quiet machine.

The division surgeon was a regular officer, a lieutenant colonel. He believed—as do all these R. A. M. C. men and most of the recently appointed civilian surgeons—that mere doctors are of little use in war. The consequence was that his men were efficient, wonderfully prompt, and devoted to him. He never roared at his men, but politely flayed them when they needed it. We saw him do it. He had been in the sector only 12 days, but he already knew it well and piloted us through a perfect maze of trenches without an error.

The main dressing station.—This was practically a field hospital and could accommodate up to 150 men. It was located in a more or less damaged house and outbuildings, some of which were Nissen huts. It supplied the A. D. S. and R. A. P. There were 7 motor ambulances, 3 horse ambulances, 4 supply carts, with their limbers, etc. The horses were exceedingly well cared for and showed it. The harness was not only soft and well preserved by liberal use of saddle soap, with metal parts burnished like new, but the stables and dependencies were orderly and well whitewashed. This unit had its barber shop, saddlery shop, carpenter

^a For index list of subjects of the documents promulgated by the Army Sanitary School, A. E. F., see p 1195.—Ed.

shop, and its own canteen. There were separate dormitories, messes, baths, and latrines for the officers, noncommissioned officers, and the soldiers. The Nissen huts were excellent. They were lined with wood, well heated, well ventilated, and each held some 40 men. The beds were of iron, and the Red Cross had furnished some articles of furniture as well as games. The baths were of the "secours-aux-soldats" type. The equipment of the men was stored in a separate building, and a receipt was given to the soldier therefor. The rifle and other arms were daily oiled and cleaned. The whole place reminded one of a roadside inn near or at a pleasure resort. Whitewash had been used inside and out.

Surgery was not done here, save in great emergency. There was a ward for medical cases and one for evacuation. The wards were neat and had matting on the floor. The kitchens had grease traps to conserve the fats. We saw ablution benches, clothes driers, a lamp cleaning house, an incinerator, harness shop, and blacksmith shop. There were also dugouts for patients in case of bombardment. Usually they calculate on a stay for their patients of not over 48 hours. The discipline was perfect and the cleanliness and order of the place was remarkable. Officers showed great interest in the welfare of their men. The commanding officer was a lieutenant colonel. He kept an admission and discharge book only. Here was prepared the envelope and card worn on the clothing of the wounded or sick man.

The advance dressing station.—When the case is severe, it is sent direct to the C. C. S., but a yellow slip, giving only the date, is also sent at the same time to the M. D. S.

We now took the automobile again and proceeded to the A. D. S. There is no fixed personnel or supplies for such a station, very naturally, as where one will need 10 men another will need 40. Both advanced dressing stations, however, are manned by men of the R. A. M. C., and the A. D. S. always keeps men at the R. A. P. This station was exposed and in the cellar of a large farm building of brick which was very generally demolished by shell fire. Part of the cellar was lined with sheets of corrugated iron and banked outside with handbags. The personnel consisted of 2 officers and 28 men. Here Professor Garrod's son was killed. A narrow-gauge track connected it with the regimental aid station, near by. It was actually receiving wounded from three regimental aid stations. There were accommodations for 24 patients, but they could receive 50 in a pinch. They got their wounded generally in the early morning. All bad cases which they received went to the C. C. S., and light cases to the M. D. S. Two Thomas splints were kept here. Only first-aid surgery is done, but the dressing is if it is needed. Here the rum ration is issued for men going forward only. Some bed pans and urinals are kept on hand, as wounded men may have to be kept for some hours. The entrance to the dugout is high to avoid the worst of the gas, as it follows the surface of the ground closely. Gas-proof cabinets for dressings and food were seen. The medicines noticed were lysol, tincture of sodium nitrite, pierie acid, spirits of peppermint, ether, and camphor. Every time a man is sent to the C. C. S. by ambulance a Thomas splint is sent to replenish the stores. The men sleep upstairs over the cellar so as to have a rapid downstairs getaway to reach the cellar. Here an oxygen tank with 250 to 500 liters was found and a clover ether apparatus to administer the gas. Wheel litters were lauded and used over the road to the regimental aid station and also to the M. D. S. at night. The stock of supplies is small.

From this station we started towards W. C. by open road, the whole country being under shell fire. W. C. is a dilapidated village, all shot up, with no undamaged buildings. In the ruins of one of these was the division canteen, and hot soup and chocolate station. The canteen was always open for weary soldiers going to or coming from the trenches. Here there was an R. A. P. for the support battalion. Near this station we saw some batteries of Artillery in action. It was in a cellar, 10 feet deep, shrapnel and splinter proof, with two openings guarded by curtains. It was well whitewashed and had an oxygen tank, two Thomas splints, heated litter with blankets and accommodations for five patients. Personnel: 1 officer, 2 orderlies, 2 water-duty men, and 2 bearers. All these R. A. M. C. men stations were supplied alike with these articles, but there is a considerable variety in quality and quantity of drugs and dressings and in local conveniences, according to the medical officer in charge. This elasticity in personnel and equipment seemed convenient and sensible. All blankets and Thomas splints sent down were replaced by taking them from the ambulances. They sent wounded by litter bearers or tramway. All of these stations had wheel litters.

From this point we proceeded to the front trenches. Our route lay through excellent, well revetted, dry trenches that had duck boards; but they were by no means always deep enough to screen the head, nor were they 3 feet wide at the bottom. After a walk of about a thousand yards we reached the R. A. P. of H's regiment. The country was all tumbled up. The R. A. P. was in a cellar and was not shell proof, but was commodious, and here we saw quarters for the men. Outside was a wheel litter which was wire wheeled and had wire springs.

At this point we left for the immediate front. The scene became more and more desolate. The weather was cold, damp, and cloudy. We reached an observation point in a "strong point" which had been heavily shelled the night before. Here we looked through a sight at the German positions 200 yards away. Pretty soon we left the trench and walked to an Artillery position in a piece of ground near a ruined church. There was not much of the church left, and if we had not been told it was a church we would not have known it. After some little difficulty we climbed up into the tower, a stump of which was left, the only trace of the church, and again looked out through a slit to the German position. Returning we again found our trench and began our trip through the lines. The scene at this point was desolation itself. Not a tree or one brick on another gave a semblance of human occupancy. The ground was literally plowed up by shells. Shells and trench mortar projectiles now passed over us and we saw many of them strike. Our objective was an observation point beyond the front line and overlooked the German trenches only 30 yards away. We slipped in with the battalion officer, carefully closing the curtains behind, and from here looked into an enormous crater caused by shell bursts. We stayed in the trench and had lunch, conversing in undertones. In about 20 minutes we started to the R. A. S. at H. Street, and traversed the whole front sector, mostly in the front line or in the support trench. We met a large number of men repairing trenches after last night's affair, and passed over one place where last night many were gassed. We found the R. A. P. at H. Street located in a cellar of a ruined house. It was commodious and like the others. Here we found the water was chlorinated and treated by the method of using one and one-half scoops of bleaching powder per tank of water, an amount calculated as necessary by the Harrock apparatus. Here we saw an overhead trolley. There were two wheels on the track for each iron-expanded frame, on which hung a litter. There was a road at night for wheel litters and tramway. The medical officer had his quarters in the rear of a dispensary. Two previous officers had been American M. O. R. C.'s. There were some gas cases awaiting transportation here, I should say about eight. They were all in fairly good condition. At H. Street we found a beautiful A. D. S. Three large rooms—one for wounded, one for gas cases, which was cut off from the rest by curtains, and one for hospital personnel. They were sending these cases to M. in wheel litters and ambulances, but two ambulances were kept constantly here. There was a good kitchen, cocoa station, mess hall, etc. Here we took the machine for home at about dark.

Among the things we saw was the so-called "Helby box" for the sterilization of dressings. It was simply two tin boxes, one fitting over the mouth of the other. The upper one, perforated on two sides, corresponded to similar perforations on two sides of the inner box. The holes were placed in apposition in the sterilizer and given a 90° turn when the sterilization was completed. Beds were made of matting nailed on frames. There were separate quarters and dining room for the noncommissioned officers. The personnel of the R. A. P. was 1 officer, 1 corporal, 1 orderly, and 4 R. A. M. C. litter bearers from the A. D. S. There was a gas guard on duty at all times. A medical officer has six days in the trenches and two out.

The bucket type of latrine was used in this sector. All officers and men are well dressed clean, shaven, and comfortable, even in muddy trenches. We saw few soldiers in the fire trench, but all these were wide awake. The discipline is excellent. There is a weekly physical examination for lice.

Army Sanitary School No. 16.

LECTURES GIVEN AT THE ARMY SANITARY SCHOOL, LANGRES, FEBRUARY, 1918

By Capt. H. L. Sanford, M. R. C., Urologist, 42d Division, A. E. F.

(NOTE.—Some of the material in these lectures was taken from Circular Letter No. 28, issued by the chief surgeon of the 26th Division, for which due acknowledgment is made.)

SUMMARY

United States Army Regulations and general orders relative to venereal disease; provisions in the British and French Armies.

Venereal prophylaxis—details of technique; results secured (statistics in France); semi-monthly inspection; responsibility of company commanders and squad leaders.

Incidence of venereal disease—in the British Army; in the French Army; in United States camps.

General plan for treating venereal disease in the United States Army in France—reasons for the plan; recent experiences.

Syphilis—necessity of early diagnosis and treatment; drugs used (with demonstration); suggested standard treatment (for primary syphilis, outline furnished; for secondary, tertiary, and latent syphilis); precautions before treatment is begun; technique of novarsenobenzol injections (sterilization of instruments; preparation of patient; preparation of solution; injection; dose and contradictions; reactions to novarsenobenzol; French experience); technique of cyanide of mercury injections; general instructions to patients with syphilis after novarsenobenzol injections; inspection of patients.

Gonorrhea—general remarks on diagnosis and treatment.

Venereal sores—necessity of accurate diagnosis between syphilis and chaneroid; means used.

Chancres—methods of local treatment.

Chanroids—methods of local treatment.

Cases which should be sent a camp hospital—enumeration of complications of gonorrhea, syphilis, chanere which require hospital treatment.

Remarks on wounds and injuries of the genitourinary tract as seen at British casualty clearing stations.

LECTURE NO. 1
